## TOWN MEETING!

### *An Old-Fashioned Idea More Needed Today Than Ever*

By WILLIAM GILMAN

**P**ROFESSORS are apt to say Town Meeting is democracy in its purest form. Yearning city folks often over-glamorize it to the point where New Englanders find it hard to recognize themselves. Actually, it's plain good sense based on the old-fashioned idea that power belongs to the people. *When they know what's going on*, they don't need bosses to do their thinking for them; they are best judges of what they want and can afford; they don't stay home alibiing. "What's the use?"

In the city-like towns, of course, "March Meeting" is bound to be more cut and dried. In smaller towns (typically a village with surrounding farms), it's still the day of year when every qualified voter can take a hand deciding local issues. Besides voting, he can throw everything from wisecrack to speech into the kettle. Loud talkers and town clowns provide entertainment. Smarter ones talk less often, have more to say when they do.

In a well-run town, the meeting ends by chore-time. When issues are hot, or a town's incompetently run, cows don't get milked till late, and the post-mortems last weeks.

There's also the matter of personalities. March usually shows roads at their worst. Easter and sugaring haven't arrived yet to sweeten up human nature. Winter confinement has put most folks in a cussed state where they could stand a stiff dose of sulphur and molasses. They have saved up complaints and aren't in a mood to be shushed. Gossip and backbiting come out in the open — a year's accumulation of smoke is cleared up by the true facts. If enemies are made, so are friends. Neighbors who haven't been speaking find themselves seconding a motion to get a new culvert on their road, or pass the beans at the dandy dinner put on by Ladies Aid or PTA, and end up praising each other's deer rifle.

It boils down to real self-government. Why hasn't the town clock been fixed? Why is the town pauper's wife having hair-dos at public expense? But mainly, the business concerns those two things affecting almost every family and definitely every pocketbook — roads and schools. They're the big tax-eaters. After everybody has had his or her say, it's money that talks. Town Meeting demands things.

**T**HIS article is in line with the determination of *American Agriculturist*, Freedom on the March, the Sons of the American Revolution, and many other individuals and organizations to arouse the people to save their liberties by taking more responsibility and a more active part in local government. The first step in control of state and federal governments is to make our own grass roots government work. Good government as well as religion begins at home.

**This means attending and taking part in your school meetings, town meetings, local caucuses, and even perhaps forming committees of laymen to work with and support local officers for better home government.**

It also has to vote the tax rate.

So, after telling the Selectmen and Road Commissioner all the things that should be done, it ends up voting what the majority wants to afford. Same with School District meeting held the same day in Vermont, when it takes up the old argument: whether to make the old school get by a while longer, or build a nice brick one, or buy a bus and consolidate.

Every meeting has its spendthrifts and its ultra-conservatives. In between are the folks who will buy new ideas that are financially possible—the new school licked this year may win next year if it's presented by somebody with better facts and figures.

Election of officers can be a mighty tense affair, but usually doesn't take much time. Many towns now use the Australian ballot, which saves time and friendships. Besides, politics and cliques in New England are like elsewhere—the heavy politicking has already been done around kitchen stoves or at caucuses.

A modernism is having a pre-Town Meeting session to start public discussion on issues. But there's also the old-fashioned prelude—the annual Town Officers' report. It comes by mail a few days before Town Meeting, and becomes more popular than the new seed or mail order house catalog. Families and neighbors gather in kitchens, going behind the neat audit figures to ferret out where the money went and who got it.

The report also contains the "Warning" for the coming meeting—(Continued on Page 14)

♦ The "cracker barrel philosophy" and public opinion developed in scenes just like this helped to make America a great Republic. The ideas discussed around the stove in the country store and in the local post office were later aired in the Northeast in town meetings, and the final conclusions reached were almost always sound. Today we need more of the "hot stove politicking" in every community.

# NOW MORE THAN EVER

## You need America's No. 1 tire!

**I**N these times, no one can tell how many *extra* years of service you'll be needing from the tires you buy today.

That's why Goodyear's SUPER-

SURE-GRIP is the wisest tire buy of all. Its three extra-traction features insure more drawbar pull—*plus extra-long wear to see you through the years ahead.*

Voted the best-liked tractor tire in America in the newest nationwide farm survey, SUPER-SURE-GRIP pulls where other tires don't—yet costs no more!

### ONLY TIRE WITH ALL THREE!

1.

#### GOODYEAR SURE-GRIP ACTION.

Goodyear lugs are set closer together at the shoulder than at the center. This exclusive design provides a vise-like grip that holds the soil in the ground, giving the lugs greater traction than curved lugs that "plow out" the soil. Result—Goodyears pull where other tires don't!

2.

#### STRAIGHT-BAR LUGS.

Because Goodyear lugs are set straight as a ruler, they have greater traction area than lugs that toe in. Result: Goodyear lugs thrust against the soil with equal force from center to shoulder, giving better traction both backwards and forwards—"the greatest pull on earth!"

3.

#### EXTRA-LONG WEAR.

Since Goodyear's Sure-Grip lug action holds the soil firmly in the ground, skid, slippage and abrasion are greatly reduced. Goodyear's famous O-P-E-N C-E-N-T-E-R self-cleaning lugs have no mud-catching hooks or cups. The result is smoother riding, less slip, far longer life!

# GOODYEAR

## Super-Sure-Grip Tractor Tires

# AMERICA'S FAVORITE COMBINE TAKES TREFOIL IN STRIDE

You can't wait for windrows to cure completely if you want to get the greatest possible yield of birdsfoot trefoil seed. You have to save it before the pods pop, regardless of green stuff. That's the reason why Ray Vaughn has such success with his Model "A" Case Combine, shown above at work in the Lake Champlain area of New York.

Whether you raise grain, tiny clovers or big beans, the Case "A" Combine does a good job of saving the crop. Its steel spike-tooth cylinder has ability to "eat up tough stuff," plus tremendous threshing capacity—to comb grain from tough straw and coax tiny seeds out of close-clinging hulls. Agitator action by its extra-long straw rack shakes out seed from soggy straw. Its quick-shake shoe with Case Air-Lift cleaning principle saves seeds more surely, gets them cleaner.

Liberal use of anti-friction bearings, supported on a sturdy steel frame, makes it a long-lived machine. The Case habit of making every part a bit better than might seem necessary holds down upkeep cost. Backed by 109 years of experience in building grain and seed-saving machines, the Case "A" Combine has earned its reputation for making the most of crops under the most difficult conditions.

**Other Case Combines** include the low-cost 5-foot Model "F-2," ideal for power-take-off operation with 2-plow tractors. Self-Propelled combines and pull-type models with auger headers are built in 9 and 12-foot sizes—all with either spike-tooth or rub-bar cylinder. See your Case dealer for full information.

# "Takes" and "Mistakes" With Chemical Fruit Thinning

By DAN DALRYMPLE

**M**Y FIRST thinning experience on apples was with a Di-Nitro material called Elgetol used on Wealthies. Little Wealthies are particularly bothersome and you always get them if they are not heavily thinned. Hand thinning is too late and does not bring trees back into production the next year. A carefully thinned Wealthy is a beautiful product, salable most any year.

Following directions, but with considerable head-shaking which clearly indicated misgivings on the part of our foreman and his father, and after talking every hour or so with our county agent for three days about proper timing, we gave them a good shot of Elgetol, carefully diluted and sprayed on rather heavily at full bloom. The next day or so when the blossoms had all turned brown and the leaves started to scorch, one of my partners arrived and after looking the thing over, we decided that with my inexperience I had better confine my managing to things known-for-sure.

## It Worked!

But after a couple weeks, most of the trees recovered and the beautiful large Wealthy apples harvested in this block had little resemblance to the little green devils in the other blocks. A few trees, weak from girdling and old age, were off color half the summer and did not crop the following season. A few of the satisfactorily thinned trees did not crop the next year either, showing we still had something to learn.

Research results on Hale Haven peaches with Elgetol were so definite that we sprayed our whole block. I did this when Emil, the oldest and most experienced hand on the farm, was not looking. This was the first and only time that our Hale Haven peach thinning really worked well for us, with very little need for any further thinning. In the three years since then, we have had varied experience from a little over-thinning to no thinning at all in 1949, when we were too cautious or the weather was too favorable for pollination, or both.

## Too Fast

My first thinning experience with the hormones, or Napthalene Acetic Acid (NAA), followed a study of Pete Hoffman's work at Cornell and some USDA experiments. With the confidence of brief experience and one year of experiments, but again with head-shaking on the part of our foreman, we decided to spray-thin our Jonathans in 1947 because they had always been small.

Visioning some big Jonathans such as we see on the market from the Pacific Coast, we gave our small, low-vigor Jonathan planting the works. We used ten parts per million of Apple-set (4 oz. per 100 gal.) at full bloom on a hot day, following a prolonged pre-blossom wetting period. The Jonathan leaves immediately wilted and stayed that way. The blossoms collapsed and fell off. The few apples that stayed on, stayed small. The foreman shook his head some more, grinned pityingly, and I called up Pete Hoffman. Pete explained carefully that next time I should

read precautions as well as directions.

By 1950, we really began to get down to business. 1949 was a season of terrific long sunlight and Pete Hoffman predicted very vigorous buds and a heavy set on apples for 1950. We split our applications of DNI on Hale Havens to three successive days, hoping to time the operation better on at least a part of them. Peach blossom time was a little cooler and we were more successful in thinning out the crop than we had been since 1946, except on some very vigorous trees where we did not get off half enough peaches.

Apple blossom time came on with almost ideal conditions for pollination, so we hit the Wealthies twice with NAA, once 8 parts per million at calyx time, and then ten days later with 12 parts per million. Because of the vigor of the trees, we saw no wilting of foliage and were very pleased with our thinning, although they had to be touched up later with hand work in spots that we had missed. We did not hit the younger, smaller trees so hard. They tend to overthin.

Another combination which "took" was Elgetol at full blossom, followed by NAA ten days later. The Duchess, which cropped heavily in 1950, were sprayed fourteen days after full blossom with a heavy dose of Hormone. There was no wilting of the leaves, but we did not get off more than one half of the Duchess and had to come back in with hand thinning later. A few Duchess trees thinned out just about right.

## Hudson Valley Experience

Last summer I saw some beautiful work that growers have done in the Hudson valley on spray-thinning, under the close supervision of Pete Hoffman, John Van Geluwe and the county agents, particularly on Golden Delicious, where some wide variations were observed with various dilutions. In one block of McIntosh in the Kinderhook area the grower had spray-thinned McIntosh so that he had a beautiful crop of uniform sized apples. Baldwin orchards thinned in the Valley had come back with two crops in succession. Other results on this var-

**THIS ATLANTIC  
ONE-STOP SERVICE IS  
A GREAT THING  
FOR A BUSY FARMER**

**That's what Harry Erwin told me** the first time I drove up to his farm. "You know," he told me, "I've had my gasoline, tractor fuels, kerosene and fuel oils delivered for years. But it always seemed that all the things I wanted were never on the truck."

Well, just to show both you and Harry that won't happen now, we unloaded every compartment of my new truck, and had this picture taken. Not much chance of my running out or not having enough, is there?

**"And these ticket printers,"** Harry said, "tell a man what he's getting. I see it in black and white, and I've got a record for taxes. And I don't even have to be on hand."

**"I like your** having separate tanks, meters and hoses for gasoline and oil, too," Harry told me. "There's no chance of any gasoline or tractor fuels getting in a kerosene or fuel oil tank that way."

**Just before I left, Harry said,** "You know, this is the first time I've ever been able to get all I wanted at one time. And I like it! Because when a man's busy he just doesn't like to fuss around waiting for a gallon of this or that." You can see from what Harry Erwin said that he's mighty glad he called us. And we think that, if you give us a try, you'll be happy about it too. We'll do our best to give you good service. And we've got the finest products you can buy . . . Atlantic products. So let's hear from you. All it takes is a telephone call.

*There are only three things necessary for happiness:  
Somebody to love.  
Something to do.  
Something to hope for.*

## WHY BUY YOUR VEGETABLES?

**L**AST Saturday afternoon I went into a grocery store to get a few items to supplement the plentiful supply of fruits, vegetables and meats in our freezers. I was astonished at the number of farm people pushing the carts around in the big store and loading them with vegetables and canned stuff that I thought they should have canned or frozen out of their own gardens. I know, too, the size of the bills they paid to the cashier for those heavy loads of provisions they carried out of the store.

With the shortage of food, I don't see how any farmer, or any experienced gardener, can afford not to have a good garden this year. I don't care how busy you are, land devoted to a well-tended garden pays the best in dollars of anything you grow on the farm, to say nothing of the better quality of the homegrown vegetables and fruit harvested and processed, either canned or frozen, just at the right time.

There is a big effort now being made to get people to grow bigger and better gardens because of the war. That's the way it should be, except that inexperienced gardeners should go very slowly. This idea of plowing or spading up the backyards is foolish. It takes plenty of "know-how" to grow a good garden and lots of hard work. Those without experience should start with only a few easily grown vegetables.

While you are at it, either on the farm or in the village, don't forget a few easily grown flowers. We have to live a little as we go along as well as make a living.

Incidentally, we have plenty of peas in the ground, some of them up, (April 14) but a neighbor has me beat with some that have been up for a week. How about you?

## LET'S ERECT THE LIBERTY POLES AGAIN

**O**N APRIL 19, Patriot's Day, the anniversary of the Battle of Lexington and Concord, the Tompkins County Chapter of the Sons of the American Revolution erected the flag on the Liberty Pole at Ithaca pictured on this page.

The first Liberty Pole was erected in 1765 by the organization known as the "Sons of Liberty." The idea spread throughout the colonies, and the poles became the symbol and the rallying point of patriots, and stood for the principles for which the Revolution was fought and on which later this Republic was founded.

There is grave need that all liberty-loving Americans rally now to save the liberties which are rapidly being lost, and the Sons of the American Revolution, supported by the various veterans' organizations, by Freedom on the March and other associations formed for the purpose of saving our liberties, are to be highly congratulated for this idea of reviving the Liberty Pole as a symbol around which patriots can rally again. It is hoped that the Liberty Pole at Ithaca will start the erection of such poles in hundreds of communities throughout the state and nation.

At the meeting held in the evening of the same day at Ithaca, Hon. James W. Wadsworth, former U. S. Senator, told how our forefathers who wrote the Constitution tried to make sure that the liberties which had cost so dearly would be preserved by setting forth *exactly* what the Federal government *could* do, all of the rest of the rights being reserved to the states and to the people. To make doubly sure, Senator Wadsworth said, the ten amendments constituting the Bill of Rights were added to the Constitution, emphasizing just what the Federal government *could not* do. Unfortunately,

*By E. R. Eastman*

many of the amendments in the Bill of Rights are being violated by the politicians today.

This effort to arouse the interest of the people in the Liberty Pole and what it stands for is in line with what we have been trying to do in AMERICAN AGRICULTURIST, in Freedom on the March and similar organizations to get people to attend and take part in their school meetings, their town meetings, and their local caucuses. It is plain that no Republic can be any better at its top than it is at its roots. Good government, like religion, begins at home.

## A PHILOSOPHY FOR THESE BAD TIMES

**M**ANY OF US remember vividly the heartaches, the sacrifices, the blood and the tears of two great wars, the wars that were to end all war and bring eternal peace on earth, goodwill to men. And now look at the world today! Knowing so well what war means, is it any wonder that many of our friends speak almost despairingly of the present situation?

But to each and everyone who feels that way, and to all of you, I give my own philosophy: I tell my friends that when we give up hope we are lost. The only thing we can do is to make sure that we live each day the very best we can, do the work assigned to us better than we ordinarily would, get what wholesome fun we can as we go along, keep the home atmosphere cheerful, make the best contribution we can to the life of our community, and, when we have firm convictions, express them to our representatives in the state capitals and to our congressmen and senators.

Having done all that, we can, as good citizens, stop worrying, leave the final responsibility to God, and let tomorrow take care of itself.

## THE FIGHT TO LOWER FARM PRICES

**A**BIG FIGHT looms in Washington of vital concern to farmers and to consumers. The President has asked Congress (1) to freeze parity levels for a full year at a time and (2) then freeze farm prices at what would be false parity prices.

As you know, parity is founded on the principle that farmers should receive for their products prices

in line with what they have to pay to produce those products. Most farm prices have not reached parity yet. Those that have are the food items that consumers demand the most. The President's move to freeze these prices without regard to farmers' costs would discourage production and at the same time encourage consumption, and would lead us straight into black markets.

In spite of the constant propaganda against the so-called high prices paid to farmers, the plain fact is that in actual purchasing power the American farmer's 1950 net income averaged only about two-thirds of his income for 1945, while his production expenses in 1950 were 60% of his gross income, as compared to 52% in 1945. These facts come from the good authority of Democrat Senator Allen J. Ellender, Chairman of the Senate Committee on Agriculture and Forestry.

An additional fact is that taxes paid by farmers have increased 71% in the last five years.

This farm price situation is just another example of the lack of ability and the complete confusion in Washington leadership. Here we have on one side the Department of Agriculture calling meetings and bringing pressure to bear on farmers to increase production; at the same time, other bureaucracies in the Administration are fighting to lower farm prices. And again, while more and more production is being asked, there is a shortage of wire and twine for baling purposes, and of steel for the manufacture of farm equipment.

As I see it, the only constructive approach to these problems is for farmers and their organizations to write their congressmen and senators frequently and emphatically. Members of Congress are our last hope, not only for farmers but for America. These members want to hear from you, and if you don't tell them what you think, how can you blame them if you get laws and regulations under which you cannot operate or live?

## THOSE PESKY CHUCKS

**M**Y FARM is alive with woodchucks again this year, and the chances are that yours is, too. Their numbers have increased by leaps and bounds all through the Northeast in recent years. They destroy valuable garden truck, tons of hay, and endanger and ruin farm machinery with their holes.

Some people have good luck with bombs, which can be purchased at farm supply stores, but they didn't work well with me. This week we are planning to take pieces of burlap or other cloth, soak them with gasoline, poke them far down in the holes, light them, and block the holes. Some say it works just as well if you don't set them afire. Dozens of letters report excellent results with this method. Try it and let me know what success you have, but be careful with fire and gasoline!

Other readers report success with "cyanogas" which you can buy at your farm supply dealer.

## LOOK RESPECTABLE

**I** WISH somebody would tell me why the appearance of otherwise good-looking farmsteads is ruined so many times by clutter. I think of it every time I ride through the farm country. Why not take a little time to clean up. Pick up the trash around the yard, and go into the summer with a place that you can be proud of?

## EASTMAN'S CHESTNUT

**I**T'S FUNNY to get in a car with a male driver and hear him make remarks about every woman driver he meets or passes. Although statistics show that women are just as good drivers as men, I wonder why it is that most men firmly believe that women are poor drivers?

Maybe you know the old story of the woman who stalled her car at a busy intersection. After a time the cop came up to her and said:

"What's the matter, lady? You've sat right there while the lights have turned from green to amber to red three times. Haven't we got any colors that please you?"

Liberty Pole Celebration, Ithaca, N. Y., April 19, 1951. Read the editorial on this page and help spread the idea across America.

# AA's Farmers' Dollar Guide

**A** NUMBER of indications point to a substantial reduction in U. S. 1951 food production. In March, milk production was 3 per cent below a year ago. Population has been increasing and the per capita daily production for the month was 2.04 pounds; last March, 2.13. It doesn't look like a big difference, but .09 pounds times 150 million people gives 13,500,000 lbs. less milk per day.

March Crop Report showed a drop of 173 million bushels in winter wheat prospects since December 1. Farmers have indicated intentions to plant 5 million fewer acres of corn than PMA suggested. Very little chance that corn crop will total the 3½ billion bushels needed to maintain livestock.

Fortunately the situation is at last being recognized. At the request of the National Council of Farmer Cooperatives, a National Committee on Farm Production Supplies has been set up, and one of the members is Truman Billings of Ithaca, N. Y. (It won't help to have consumers and Defense Officials urge lower prices to farmers—E.R.E.) The House of Representatives is forming a "watchdog committee" to pressure defense agencies to give needed materials to farmers. Jesse Tapp, vice president of the Bank of America and a former USDA official favorably known to farm leaders, has been named as special adviser to Eric Johnston on agricultural stabilization problems. Franz Stone of East Aurora, N. Y., has been named to head an Agricultural Machinery and Implements Division of the National Production Authority.

Here briefly are some of the reasons why production may be low:

**ACREAGE:** "Intentions to Plant Report" indicated a cultivated crop acreage 4½ million acres below last year and far below PMA "suggestions."

**WEATHER:** Season has been late and cold. Pastures in the Northeast are slow. Less than the usual plowing has been done. Few oats planted up to last week in April.

Better weather could repair all the damage, or continued poor weather could cut production seriously. With a number of good growing seasons behind us, there is some tendency to expect a below-average year.

**SUPPLIES:** Already shortages of some machinery parts are being reported. In 1950, 3.8 per cent of the steel production of the country went into farm equipment, a small percentage but an important one. In World War II, ineffective attempts to save a little of this small percentage seriously hampered farming. For example, a cut was made in steel used for bale ties, and for every 10 tons of steel saved, 25,000 tons of hay couldn't be baled.

**WORKERS:** There are 300,000 fewer farm operators and family workers on farms than a year ago. Strangely enough the reduction in number of hired workers has been smaller.

Congress is working on farm labor legislation. Differences in the bills being prepared in Senate and House on importing Mexican workers must be ironed out, and it will be plenty late when agreement is reached.

**REGULATIONS:** Paper work takes time that could be better used for food production. One example is forms, more and more of which doubtless will have to be filled out to get needed supplies. Another is social security tax which now applies to farm workers. A farmer must deduct from wages and file a return under certain conditions. (Get Form 941 from Collector of Internal Revenue where you pay income taxes.)

**FARM SCRAP:** Earl Merrill of Republic Steel Corporation, Cleveland, reminds us that scrap steel shortage is becoming national bottleneck in steel production. It is important to clean every discarded machine out of fence corners. Bring the matter up at Grange or other farm meetings so that your neighbors will know the situation and act on it.

**PATH TO ECONOMY:** The path to greater government economy is plain, but difficult to follow. Your representatives in Congress hold the purse strings.

If enough voters want economy, want it hard enough, and let their representatives know how they feel, it can be secured. It is up to you! — Hugh Cosline

## The Song of the Lazy Farmer

**A** LL winter long I sit around and plan on how I'll farm my ground; I study market prospects thru and draw up maps until I'm blue; I read whatever comes to hand about how we should treat our land; I list rotations I could use and finally figure which to choose. And then I order all my seed and get the plant food I will need; as soon as snow begins to wane, I make Mirandy start to train so she'll be hardened up and fit for work when time is ripe for it; and then, to be as safe's I can, I sign me up a hired man.

Comes spring, and it begins to rain, then all my efforts are in vain; for weeks the weather's soggy wet and it's not possible to get into the fields to do a thing until almost the end of spring. With ev'rything a month behind, it isn't long until I find that once again the weatherman has wrecked my carefully laid plan. So I get out my maps again and try to figure where and when and what I'll have Mirandy plant in place of all the things she can't; and with each day of rain I yelp because I know I'll have to help.

★ **Handles Anything**

★ ★ **Easy to Use**

★ ★ ★ **Lasts a Lifetime**

that's why a **NEW IDEA** is a good idea!

★ **You name it**—ear corn, shelled corn or small grain, hay in regular or round bales—the NEW IDEA No. 175 Elevator makes storing any crop a fast one-man operation. Big-capacity trough is 17½ inches wide. Closed return trough saves loose grain. Choice of lengths from 26 to over 50 feet. Comes with stationary hopper, or with tilting hopper and swivel grain spout.

★ ★ **Handy to use**—quickly and easily coupled to tractor, moved around and positioned. Simple to adjust for variable reach and proper balance. Safest winch used on any farm elevator. The NEW IDEA No. 175 operates through a wide variety of drives—from gas engine, electric motor or power take-off. Low tilting hopper is ideal for modern farm wagons. Extra trunk sections (8' and 10' lengths) readily added.

★ ★ ★ **Lifetime construction**—staunchly braced against bowing or bending with special suspension trussing—simplest, strongest bracing ever developed. No other elevator gives you this super-strength feature! Heavy galvanized steel sections, box-crimped for unusual rigidity. Lift cable of plow-steel wire is fibre cored—lasts a lifetime. Curved flights are 30% stronger, spaced 13" apart. Tough steel chain rides quietly on wear-protecting wood strips.

These features make the NEW IDEA No. 175 a history-making value—the workingest, wearingest farm elevator you've ever been offered! See it soon at your NEW IDEA dealer's.

HERE'S WHY YOU GET

# Greater windrow capacity

WITH THE

## NEW HOLLAND Forage Harvester!

Now—a great new forage pick-up for use on all models of the New Holland Forage Harvester!

• Here are good reasons for New Holland's high capacity. Look at the two pictures at the right, for instance. See how the revolutionary *floating upper apron* keeps constant control of hay. It's an exclusive New Holland feature!

New Holland's Harvester is engineered to handle up to 20 tons of grass silage, 20 tons of corn silage, or 6 tons of dry hay per hour. It's completely automatic—one man on a tractor does the whole job!

More New Holland features:

1. Four-knife balanced flywheel cuts down and in, for better cutting action.
2. A complete micrometer adjustment for clean cutting—knives easily removed for sharpening *without* readjustment.
3. Feeder action can be stopped, started or reversed *from the tractor seat*.

See your New Holland dealer today.

Here's the secret: As hay wad (big enough to clog many choppers) contacts front of upper apron, apron rises and allows passage—without slugging or choking.

As wad passes, front of apron drops back to normal for control of lighter windrows that follow. Rear of apron opens and wad passes easily into big 112 square inch opening. Crawler-type apron is synchronized with lower track to maintain constant feed control.

# KILLING WEEDS in Seeded Grains

By E. R. MARSHALL

**A**S SPRING arrives in the Northeast an amazing change takes place. Grain fields and pastures which have lain dormant through the winter turn green, and the whole countryside gives the impression of being covered with a luxuriant green carpet. Then shortly after spring has come and about the same time summer really begins, this carpet of green starts to change its color. Field after field begins to turn a brilliant yellow.

These fields are beyond a doubt beautiful, but this beauty is not welcomed by the farmer, for this change is a sign that the same old pest that northeastern farmers have lived with for years is back again. This, notorious pest is wild mustard. Many tons of fertilizer are thrown away each year just to feed this pest. Mustard robs the soil of water and nutrients. It also contaminates seed crops, and shades or competes with many crops.

2,4-D has done much to help control wild mustard and other weeds in grain. Its greatest shortcoming, however, has been that it could not be used on grains which were seeded to mixed legumes. In some cases where the weed problem was severe enough to ruin a legume seeding, 2,4-D was used as an emergency measure. In the few cases in which this was done there was usually some reduction, often severe, in the seeding. Because of this, 2,4-D has not been used extensively on weeds in grains which were seeded with legumes.

## MCP, A New Weed Killer

The lack of a good chemical for weed control in seeded grains has been a serious problem to farmers. Many thousands of acres of grain are used as a nurse crop for legume seedings in the Northeast. Often mustard and other weeds seriously reduce and contaminate the hay crop. Because of this, research workers have tested each new herbicide as it was developed in hopes that at least one would help with this problem. Their search was finally rewarded, and today we have a material designed especially for this job. This material is MCP.

MCP stands for 2-methyl, 4-chlorophenoxyacetic acid; also called Methoxone and Agroxone. Because extensive work has been done with this material in England and other countries in Europe it has often been called the "2,4-D of Europe." MCP is a very close relative of 2,4-D and has been found to give as good or better weed control in grain crops. At the same time, red clover, alsike and sweet clover all have been found to be less sensitive to MCP than to 2,4-D. Legumes seem to tolerate about twice as much MCP as 2,4-D, but since MCP is very similar to 2,4-D, the same precautions followed when using 2,4-D should be used when applying it.

Large scale tests conducted in New York State during 1950 showed that MCP gave better mustard and ragweed control than 2,4-D when both were used at the same concentration. As many, clover and alfalfa plants survived when MCP was used at twice the concentrations of 2,4-D as survived in the 2,4-D plots. Hay yields from these tests showed that alfalfa or clover harvested from the MCP plots out-yielded that from the 2,4-D plots and the untreated check plots. Similar results are reported from Wisconsin, Canada and Europe. These reports also show that MCP does less damage to oats than does 2,4-D. Reports from Wisconsin state that MCP gives better grass control than 2,4-D.

Minnesota research workers found MCP to be much better than 2,4-D for killing wild mustard growing in flax fields.

## When to Use It

MCP should be used only on seeded grain fields in which weeds are a severe problem. The fields should be treated when mustard is just coming into bloom and the grain is 8 to 10 inches high. Farmers now have a material which will remove weeds from seeded grains and which will result in little or no injury to the grain or the legume seeding.

Since MCP shows such low toxicity to legumes, it is now being tested on canning peas. Perhaps in MCP we may have a material which will effectively weed canning peas with little or no reduction in yield. The use of MCP on peas is still in the experimental stage and is not yet recommended for general use.

It is very important that MCP be applied at low gallonages, such as five to six gallons of spray per acre. Injury to the legumes is noticed when gallonages reach 10 gallons of spray per acre or above. The recommended rate of application is  $\frac{1}{4}$  pound of active MCP per acre in 5-6 gallons of water. The material now being sold contains 2 pounds of MCP per gallon so that one pint of this material should be used in 5-6 gallons of water per acre. The amine salt formulation now available is readily water soluble, and thus no trouble is encountered in concentrate spraying.

Supplies of MCP are liable to be short during 1951, but enough will be available to treat the more severely infested seeded grain fields. If you have a severe mustard or weed problem in seeded grains, obtain some MCP and profit by its use.

Certainly this is a major advance in the field of chemical weed control. It means that now farmers can watch that green carpet of grain remain green until the golden tinge of ripening begins to appear. The intermediate step of brilliant mustard yellow may soon be a thing of the past. MCP shows promise of being one of the most important chemical weed killers yet developed.

## TULLY FUTURE FARMER WINS ESSAY CONTEST

Robert McDonough, R.D. 1, Tully, N. Y., has been awarded first place in a nation-wide essay contest sponsored by the "American Farm Youth" magazine on the subject, "Why I Save for the Future." Choice of first prize rested between a fully equipped garden tractor, an arc welder, a jet water system or a milking machine.—H. B. Allen, Teacher of Agriculture, Tully, N. Y.

# The greatest labor-saver since the milking machine

**"Makes a Big Difference  
in the Way I Feel"**

—NELSON VARCOE,  
Honesdale, Pa.

Nelson Varcoe has a G.L.F. Stable Cleaner installed in his 28 cow dairy. He has no hired help. Mr. Varcoe says:

"I make milk with hay instead of grain and that makes a lot of manure. My 7 inch gutter is 16 inches wide, and it is heaped right up every morning. The G.L.F. Stable Cleaner takes it out in no time. The beauty of it is that when I get done I am not all tired out. I can go out in the afternoon now and cut logs instead of lying down to get rested. If I could have had my gutter cleaner 20 years ago I'd be milking twice as many cows today, because I would have had the strength and the time."

**F**EW dairies of any size still milk by hand. Before many years, cleaning the stable by hand will be just as rare. The machine age has at last caught up with the meanest job on the farm. You have only to see the G.L.F. Stable Cleaner in operation to know that here is a practical tool for taking the back-breaking work out of the daily barn cleaning chore.

For years farmers themselves have been experimenting with home-made cleaners. Time after time, as G.L.F. men visited farms and talked with farmers in meetings, the question would come up—"Why don't you tackle this one? Stable cleaning is the job we would really like to get rid of." More than three years ago G.L.F. did tackle it.

## Farmers Helped Design It

The first few tries didn't provide the answer, but they did convince the men working on it that they were on the right track. Finally, about two years ago, they produced a belt-type cleaner. Several were manufactured and placed on dairy farms. They were used day after day under actual working conditions. Week after week G.L.F. men visited each farm to see them in operation and talk with the farmer. It was clear that the belt principle was practical. All that remained was to get the "bugs" out of the cleaner, something that has to be done with every new machine. That development

stage has gone on for two years and now the G.L.F. Stable Cleaner is ready—proved in actual operation.

## Farm Tested Features

**Delivered assembled** and ready to use. The cows can stay right in the barn while it's installed!

**A flat belt** especially fabricated to resist acids and withstand abrasive wear is all there is in the gutter.

**The chute** outside the barn to convey the loaded belt to the spreader is made of highly rust-resistant, hard alloy steel which has twice the strength and six times the corrosion resistance of ordinary steel.

**The heavy duty motor** takes a heavy starting load with ease and is directly coupled to the speed reducer to provide full, positive power even when exposed to the weather.

**Two Models**—Model 500 (shown above) for installations where the spreader box is above the gutter level. This unit rolls easily on wheels to serve two or more gutters and can be moved out of the way when a clear barnyard is needed. Model 300 is for use where the spreader box is at or below the gutter level.

The G.L.F. Stable Cleaner will soon be available through your G.L.F. Service Agencies. Ask about it. Particularly if you're planning a new barn or changes in your present one, plan to include the G.L.F. Stable Cleaner as part of your basic equipment.

Cooperative G.L.F. Exchange, Inc., Ithaca, N.Y.

## STEEL THRESHERS

Have built into them the quality you want most—large capacity, smooth operation, and the utmost durability. Three generations of experience in thresher work stand behind these Frick machines. Two sizes, 22 by 36 and 28 by 47 inches. Welded steel frame, roller and ball bearings, spiral beater, gravity cleaner, self-feeder or hand feed. Unexcelled for wheat, oats, clover, lespedeza and seeds. Write for Catalog 76 giving full details.

See your Frick Dealer or visit a Frick Branch today! Frick Branches at Amsterdam and Canandaigua, N. Y., Easton, and Montoursville, Penna., among other principal cities.

Frick Company also builds Air Conditioning, Refrigeration, and Ice-making equipment.

## What Do YOU Think?

By JIM HALL

**R**ECENTLY I wrote to a bunch of men I've called on or corresponded with one way or another during the past couple of years, and asked them for their ideas on some of the advertising we carry in AMERICAN AGRICULTURIST. The response was just fine, but even better than that was the way many of them took the opportunity to say what they thought about dozens of different things of interest to Northeast farming. Men in the Northeast aren't just talking about new things. They are trying out new ideas every day and always looking for more ideas from their neighbors and from their farm paper, as shown in this note from Luther W. Jennejohn of Hilton, New York:

### Wants Practical Items

"We farm folks are faced with an acute labor shortage. We are told that equipment will be even shorter in the future. Our present administration does not seem concerned about food production. So we folks who still love the soil and till it must help ourselves. As a farm paper, could you give us more articles on practical labor saving, farm management, etc.?"

Of course the answer to that is yes! One of the first editorial policies of AMERICAN AGRICULTURIST is to get out and find money-making and money-saving ideas and then pass them along to all of our readers.

\* \* \*

That these new ideas are picked up by our readers is demonstrated in a letter from Lee Dygert of Fort Plain, New York. But in the same letter, Lee brings up the much-argued question of whether to buy started pullets or chicks. We'd like to hear what other poultrymen think about buying started pullets. Here is what Lee says:

"Along with our dairy we keep quite a few chickens. This year we are trying out two new methods. The first is the use of old litter. It is working out fine, and I believe our leghorns are doing better and living better than ever before.

"The other is the buying of started pullets instead of day-old chicks. It will make a lot less work for me, and I hope it will be a help in keeping layers on hand at all times. Our first batch of 300 was delivered yesterday. I was a little disappointed in the size of some, but when so many are started together one cannot expect quite as good growth as smaller flocks that get more attention."

\* \* \*

Our long-time promotion of better and better roughage, and of the need of growing more of our own grains for feed, has prompted many letters—especially about the fast growing practice of making grass silage. The following two especially interested me because the first deals with birdsfoot trefoil and the second provokes a lot of thought in just 22 words:

"I am always interested in the articles on grass silage and on pasture improvement. I started a field of birdsfoot trefoil after reading the articles about it in your paper. I have cut it one year and I am well pleased with the crop as hay."

—Ralph W. Davis, Madison, N. Y.

\* \* \*

"Feed is high, which is only natural with government supports for grains.

This puts us in a perilous position in the Northeast."—John C. Perry, White House Station, N. J.

\* \* \*

Well, it would put us in an even more perilous position if we had to depend absolutely on having all of our grain shipped in. As Editor Ed Eastman pointed out in a recent note on the Kernels, Screenings and Chaff page, hybrid seed corn and the mechanical corn picker give many of us a way of getting around that 30-odd dollars it costs for labor and transportation to get the grain from the Mid-west to the Northeast.

### Two Problems

Paul Fish of East Freetown, New York, says:

"I note some advice on letting calves suck for three days. My idea is not to let them suck at all, making it easier for them to learn to drink. Then the cow does not get attached to them and bawl for days later. Also, the calves are apt to get too much if they suck."

Others try different methods. Several men I know (the latest of these is Harry Trout of Detour, Maryland) keep a nurse cow to raise the young 'uns and swear it's the best system they ever hit on. AMERICAN AGRICULTURIST readers are always interested in notes about how best to raise calves. If you have any ideas on the subject, let's know what you think and we'll pass the information along to other dairymen.

The other problem—one that has always pestered dairymen—is summed up in this letter from Carlton L. Hazen of Wilson, New York:

"We are interested in calves and growing heifers, for we raise quite a few of them ourselves. Our bull and heifer calf ratio was very poor this last fall and winter, having had about 15 bull calves and six heifers. Would like to know how to get more heifers, if possible. Our luck in getting heifer calves has been very poor with both artificial breeding and natural service."

Now the scientists and most farmers tell us that they know of no way to influence the sex of calves. In my whole life I have met only one dairyman who thought he had the answer, and that was a Vermonter who swore he got mostly heifer calves because he always had his bull service many more cows than the average bull. If you have any ideas on how to influence the production of more heifer calves, let's have 'em!

**"BEST STUFF  
I EVER  
USED"**

## WEEDONE<sup>®</sup> BRUSH KILLER 32

**makes it easy  
for anyone to add  
more profitable acreage**

This more powerful, low-volatile butoxy ethanol ester of 2,4-D and 2,4,5-T kills only the plants sprayed. There is no vapor injury to nearby susceptible plants such as tomatoes, beans and cotton.

### Kills Over 100 Woody Plants

Brambles (blackberry, raspberry, etc.), choke cherry, poison ivy, poison oak, certain species of oaks and pines, wild rose, osage orange, willow, wild cherry, hickory, buckbrush, sagebrush, elderberry, coralberry, honeysuckle and many others, as well as thistles, knapweed and other perennial weeds.

### Get More From Your Acreage

Clear pastures of bramble and brush patches . . . more grass for your livestock.

Clear irrigation ditches of choking weeds.

Clear fence rows, bottom land and roadsides of brush that robs nearby crops of moisture and plant food, while giving shelter to harmful insects.

## "Takes" and "Mistakes"

(Continued from Page 4)

iety did not always result in annual bearing. Sometimes this variety skips a year in spite of anything that can be done. Romes are the toughest variety to thin that we have. Here the DN's at blossom time seem to do the best job. NAA is not so effective yet.

The tendency generally however is to use NAA after the critical blossom period is over and you can guess more accurately what you have. Preliminary one-year work on NAA on peaches by M. B. Hoffman of Cornell suggests good thinning of peaches one month after blossom when peach trees have more foliage.

In 1950 the most satisfactory results with NAA on peaches were obtained with 15 parts per million on Golden Jubilee, 20 parts per million on Raritan Rose, and 30 parts per million on Hale Haven. The results may vary from one year to another, depending on the weather. Concentrations stronger than 30 parts per million may defruit the peaches. If you want to play with some of these materials on thinning peaches, Professor Hoffman suggests a few trees until more details are worked out.

### Some Definite Suggestions

In the Proceedings of 1951 Meetings of the State Horticultural Society, just printed, Professor Hoffman offers the following suggestions for 1951 for apples:

"Heavy bloom is not anticipated for most varieties in 1951. Rhode Island Greening may be the exception. The size of this year's crop will depend a great deal on bloom weather and the kind of growing season that follows. In most seasons it pays to thin heavy set varieties like early McIntosh, Yellow Transparent, Duchess, Wealthy, Baldwin and Golden Delicious, even when they have a moderate bloom.

"If Greenings come through with a heavy bloom and we experience good pollination weather, some thinning of this variety may be in order, although it is tricky.

"The DN's are adapted to these heavy setting varieties during bloom or as soon as all the spur flowers open. With the exception of Baldwin and Wealthy, considerable thinning can be obtained with DN spray on the 2nd and 3rd day following bloom, or as petals fall. If you have hot weather in bloom time with heavy bee activity, these late sprays are not so effective. Wet weather in blossom time result in more foliage injury from this treatment and prevents proper timing.

"Severe dwarfing of the foliage of Duchess, Yellow Transparent, early McIntosh, Delicious and Winesap by NAA has been observed to interfere with proper sizing of the fruit and to prevent fruit bud formation, even though adequate thinning was accomplished, if the application is put on too soon (calyx time). Wealthy, Jonathan, Grimes, Baldwin, Golden Delicious appear to be less susceptible. Prolonged fog and rainy weather during calyx and early post-bloom may accentuate the dwarfing. For this reason the susceptible varieties should be sprayed not sooner than two weeks after bloom with NAA, even though the benefits from earlier thinning may be sacrificed. Later application does not result in enough thinning to pay."

I hope I have not discouraged you on thinning with this article. My main point is, be sure and get all the information you can from your county agent, from the Horticultural Society Proceedings for 1949, 1950 and 1951, and study them before you start to spray-thin fruit. By all means, start in this year because we do not want a whole lot of small apples again available for market.

# TEAMED-UP

for a  
stronger  
America!

Farmers and railroads are long-time "partners"—in one of the biggest and most vital jobs in America.

The farmer grows the food, the feed, and the fiber so basic to the strength of the nation. The railroads bring the farmer his supplies and equipment—and carry his products wherever they are needed.

*And these days, when national rearmament is everybody's biggest job, this "partnership" takes on even greater importance. For, as America's "muscles" get bigger, its appetite for almost everything increases enormously.*

American farmers are working to produce the crops that will be needed, come what may. And the American railroads are working with them and with all of industry to move the things the nation needs to keep it prosperous and to keep it strong.

ASSOCIATION OF  
AMERICAN  
RAILROADS  
WASHINGTON 6, D. C.

Listen to THE RAILROAD HOUR every Monday evening on NBC.

# Potato Growers

Start Right . . .

. . . Stay Right

## DITHANE CONTROLS BLIGHT all through the season

- From the time they begin to grow—until the vines are dead—potatoes demand effective disease control.
- DITHANE protects young plants—stimulates vigorous vine growth. Regular applications keep the crop healthy—help make it productive.
- A potent preventive fungicide, DITHANE is the one weapon that stops late blight in its tracks.
- The proof of the product is its performance. The record of DITHANE during five years' use on potatoes from Maine to California is your best assurance of the results you can expect if you will give DITHANE a fair chance.

## A FORUM FOR Backyard Gardeners

### Fun With A Hotbed

The following letter, dated April 11, interested me and I am passing it along:

"A couple of issues back you wrote about the value of a coldframe just outside the basement window, so it could be worked without leaving the basement. We've had one for several years.

"Last fall I made ours a little bigger and turned it into a hotbed. The foundation is one layer of cinder blocks laid without mortar and the holes filled with cinders for insulation. The blocks extend above ground level about half an inch, and the frame is set on top.

"The pit is the same depth as the foundation. In the bottom I put 1½ to 2 inches of cinders for drainage. An electric soil heating cable went on top of the cinders, then an inch of soil covered by a quarter inch mesh hardware cloth. That left about 4 inches for good garden soil. I set the thermostat for about 38° and left it there.

"Out of this little garden we had parsley and chives all winter, and we used lots of both. Some geranium cuttings put in pots sunk in the soil last fall are nice plants now. In one corner is a clump of mint. And we've been picking pansies from a couple of plants the last week or so. Now we're starting a few seeds for plants for our outdoor garden this spring.

"This small garden has given us more fun and more value than we anticipated. Now we wish we had a little greenhouse.—Irving B. Stafford.

\* \* \*

### Marking Garden Rows

To space seed rows in a small garden, just impale two corncobs on the teeth of a rake. Pulling the rake across the garden-plot results in evenly spaced seed rows, their separation of course being determined by the spacing of the cobs on the rake teeth.

If you want exact spacing of the rows, place one marker in the last row previously marked. —Miss Joan Hall, Hudson, N. Y.

\* \* \*

### A Clean Asparagus Bed

Here's an idea that will help to keep your home garden asparagus bed clean. I have tried it for two years and it works.

Following the usual cultivation early in the season, cultivate again over the entire bed right in the middle of the cutting season. You can avoid wasting the crop by cutting everything that is showing above the ground. Then a thorough cultivation will do no harm and in a few days another crop will appear. This procedure will prevent the weeds getting too much of a start, and after the cutting season is over the asparagus soon makes a growth that discourages weeds by shading them.

—H. L. C.

\* \* \*

### Temperature Determines Growth

The average temperature during the growing season determines to a large extent the number of days required to grow peas to maturity. For example, the records of the Geneva Experiment Station show that a late variety actually matured in fewer days this year than an early variety did last year. However, the heat, as measured in 'heat units', required for maturing a crop was about the same in both years. This fact has a practical application in that a close study of daily tempera-

tures during the growing season can give a fairly accurate prediction of the date when canning peas should be harvested.

\* \* \*

### What is the best single spray or dust for the vegetable garden?

Under various trade names, you can buy a dust containing a fixed copper compound and rotenone. The rotenone kills most insects and the copper handles many fungus diseases.

\* \* \*

### How late can we cut asparagus?

A new bed should not be cut the first year, and sparingly until about the fourth year. You can cut for about 6 to 8 weeks, but it's better to have a bed large enough so it will be unnecessary to cut it too late. A good growth during the summer insures a good crop next year.

\* \* \*

### What causes blue oval-shaped spots on my red raspberries?

The cause is "spur blight" caused by a fungus. The disease will be less troublesome if you will prune out the less vigorous canes to give the strong canes more light and air. Keep the rows narrow, not over a foot wide.

\* \* \*

### How can I stop damage to lima beans by the seed corn maggot?

One way is to delay planting. In central New York a good date is June 10. It would be earlier in New Jersey and Long Island. If you do get damage in the home garden, replant where the beans fail to come up, but leave those that develop normally.

## COUNTRY'S YOUNGEST BANDMASTER

A YOUNG Granger who has earned fame from coast to coast is 15-year-old Rolfe Reinhart of Roselle, New Jersey, the country's youngest bandmaster. Ralph received his Bandmaster rating while he was only 14 and has soloed with America's outstanding bands and performed on national radio and television shows.

Ralph plays both the cornet and trumpet, and started tooting at the age of 3½ years. He has flown over 6,500 miles to keep his concert engagements, and at the age of 12 played before an audience of 42,000 in Boston. Rolfe has held scholarships in four music schools, including Juilliard. In spite of his outstanding success as a cornetist and bandmaster, Rolfe wants to be a doctor, and hopes to be able to go to college and, later, to a medical school.

## Better Bromegrass Varieties

By BOB AMES

**B**ROMEGRASS is becoming more popular each year with New York State dairymen. Such popularity is well earned, says Prof. A. A. Johnson, Cornell's plant breeder, as it is an excellent hay and pasture grass. Bromegrass is a tall-growing, leafy perennial, semi-spreading type of grass. It is better than timothy for long term hay and pasture seedings with such perennial legumes as alfalfa, birdsfoot trefoil or ladino clover. Bromegrass is at its best on the fertile, well-drained soils; however, each year more farmers are getting good performance from bromegrass on soils only moderately well drained.

Cornell has for the past five years conducted more than 30 different tests on bromegrass varieties and mixtures. These tests have been located in various parts of the State. In these tests, the Lincoln variety of bromegrass has a consistently higher yield and general superiority to ordinary commercial bromegrass seed. Lincoln has produced

Lincoln, a new variety of brome grass, is very leafy and outyields common varieties.

about 10% more hay per acre, which means an extra two-tenths to three-tenths ton more feed at a very little added cost for seed. This is a good buy.

Another advantage is that Lincoln bromegrass will outyield ordinary commercial bromegrass. In other words, says Professor Johnson, money spent to increase soil fertility for the growing of a Lincoln bromegrass seeding mixture will return greater profit through higher yields than the same expenditure spent in growing commercial bromegrass mixtures.

Other bromegrass varieties that have equalled Lincoln in yield in the Cornell tests are Achenbach and Fischer. Seed of these and other superior varieties are, however, not so plentiful as Lincoln. Certified seed, if available, is recommended as the surest buy.

Lincoln bromegrass is highly recommended as a companion crop to Ranger alfalfa for stands to be left down 3 or more years. Dairymen planting Empire birdsfoot trefoil on soils of medium to fair drainage are urged to use Lincoln bromegrass in the mixture especially for pasture purposes.

Bromegrass is tricky to sow. Recommendations as to how and where to plant it can be obtained from AMERICAN AGRICULTURIST or your county agent.

# Refusal of Price Hearing Dooms Milkshed's Dairymen to \$1,600,000 Income Loss!

## Dairymen's League Plea for Continuance of April Class I-A Price Turned Down by Agriculture Department

A Dairymen's League petition, in concert with 55 other milk producer cooperatives, to continue the Class I-A price for the months of May and June at the April level of \$5.48 has been turned down by the U.S. Department of Agriculture. The petition cited declining milk production, the high price for beef in comparison with milk, the aggravated labor situation and rising costs as reasons for continuing the April price. It stated that these factors might endanger an adequate milk supply this fall.

Failure to continue the April price through May and June means a \$1,600,000 income loss to producers.

The Agriculture Department presented 10 determinations as reasons for not granting the hearing.

### Condensed for Brevity, Here are the Department's 10 Determinations

1. The volume of pool milk increased throughout 1949; was near record levels through August 1950.
2. Since August 1950, the volume of pool milk has declined, but still is high in relation to Class I sales, and to other recent years, excepting 1950.
3. For 6 months ending February 1951, the volume of milk utilized in Class I averaged lower than for any similar period since 1943, excepting the year 1950.
4. The percentage of pool milk in excess of Class I was higher in February 1951 than for any February since 1943, excepting February 1950.
5. The latest available data indicate no significant reduction in the number of milk cows in the New York milkshed.
6. The index of wholesale prices—a factor in the pricing formula—increased steadily during the last year; was 11.3% above the 1948 average in February 1951.
7. The effect of the wholesale price index on Class I-A has been partially offset through operation of the utilization adjustment factor, but the index of the Class I-A price for April stands at 103, and has averaged about 100 during the first 4 months of 1951.
8. The index of cost of production stood at 100 for the latest month available (February), thus is slightly below, but reasonably in line with the Class I-A price index.
9. Class I-A prices and uniform prices will average about 21% higher for the first half of 1951 than for the first half of 1950.
10. Past experience indicates the degree of seasonal variation, provided for in the Class I-A formula, is no greater than necessary to yield a seasonal range in the uniform price, thus to encourage a desirable seasonal pattern of production.

The Department's clinching argument was that "your proposal would reduce the seasonal variation in both the Class I-A and uniform prices."

## The LONG and SHORT of safe farm loans

More than a million farmers have found the answer to safe, low-cost farm financing in Cooperative Farm Credit loans.

**FOR LONG-TERM LOANS** — see your local National Farm Loan Association about a Federal Land Bank Mortgage. Repayment periods from 10 to 33 years, with low interest guaranteed for the life of the loan.

**FOR SHORT-TERM LOANS** — see your local Production Credit Association. Loans for operating expenses are available for periods up to 30 months and at low net cost.

If you qualify for a loan — long or short — you can count on the safest farm financing in the world.

## TOWN MEETING

(Continued from Page 1)

an agenda of business to be transacted.

At Town Meeting, election of the moderator (usually a respected citizen free of clique tieups and with a sufficient knowledge of simple parliamentary procedure) is first order of business, followed by the minutes of the previous meeting. Then the Town Officers' report comes up for acceptance. If it goes through without much debate, a calm Town Meeting is in prospect. It's the temper thermometer.

Either after Town Meeting, or between its halves, the School District meeting is held, the same crowd electing the same moderator and sweating out the same money problems.

Of course, towns have been changing and the meeting has lost some of the social importance it had in days before auto and radio. For the same "other interests" reason, there's less interest in holding office. Inability to get enough qualified officers means "letting George do it," and some towns load several jobs on one man—good neither for man nor town.

There's also the increasing complexity of modern life. In Vermont, Town Meeting self-rule is perhaps most genuine because the state is still fairly distant from big-city influences. But inflation and State Aid funds have made inevitable inroads. Formerly, a one-dollar bill was fingered carefully, everybody knew whence it came and went. Taxes were "worked out." "Our money" and "public money" weren't easily confused. Now, town books are harder for the treasurer to keep, harder for townsfolk to understand. Two years ago, Vermont was numbed by shortages breaking out like boils in one community after another. As a result, townsfolk acquired a healthy, renewed interest in town affairs.

Having local government directly in their own hands, they at least have nobody else to blame if they have bad officers or must beg the next town's fire department for protection.

\* \* \*

IN the foregoing article by William Gilman of Middletown Springs, he discusses town meetings in his own state of Vermont. Town meetings are common to all the New England states, but they are not all run the same. Some have the school meetings on different days and some call the list of things to be acted upon by the voters a Town or School Warrant, instead of a Warning.

But whatever the terms used or the procedure followed, town meetings represent down-to-earth government by the people. In New Hampshire, according to AMERICAN AGRICULTURIST reporter Charles Stratton (who himself is town clerk at Hollis), the Budget Committee holds a public meeting before the town meeting to give residents a chance to discuss the budget and make suggestions about it before it is put on the Town Warrant for the voters' decision on meeting day.

Charles says that except for the office of Selectman, there is seldom opposition to town officers, but any voter and legal resident may seek office by filing a request to have his name put on the official non-partisan ballot. The Selectmen, usually after conferences with citizens, prepare the items for the Town Warrant to be voted upon, but individual citizens can sign petitions and have additions made to the warrant. In his town this year, two such items were added by individuals to get the voters to decide whether or not the Town would have street lights installed on Flint's Pond Drive, and whether to keep the street lights on all the time at Silver Lake instead of only three months a year.

John E. Baker, town clerk at Hudson, N. H., says, "Nine hundred of 2,200 eligible voted in March and everybody had their say on what was or wasn't to be done. This year's important item

was the vote to purchase a gravel loader for use on town roads."

The townspeople at Amherst, N. H., take a very active interest in town affairs, according to Mrs. Catherine Kruger, clerk. She says, "Town meetings are not 'cut and dried'. Our town has a Ways and Means Committee made up of residents who investigate

Listen to David Lawrence on any NBC station on Sunday afternoon from 3:30 to 3:45 p.m., EST. This program by the well-known news analyst is sponsored by the American Dairy Association.

conditions in the community throughout the year and suggest what should be done about it so the voters themselves may decide at town meeting." She added, "If all the counties, states and countries in the world had town meetings like ours, there wouldn't be any wars."

Well, we don't know about the elimination of wars, but we do know that if the taxpayers themselves took more interest in what state and federal employees and legislators do with our money and our independence, we'd have a better chance of preserving our freedom.

In the town of Sandgate, Vermont, it was the voters who decided whether they'd pay \$83 towards the support of Public Health Nursing Service this year. We voters can't have such personal control over state and federal expenditures, but we can take a greater interest in choosing the men we want to make such decisions for us. It isn't enough just to vote. We must take an active personal part in local affairs and help choose the kind of men we want to run for all public offices. Then we must help them further by keeping them informed of what we think about pending legislation, about expenditures of our tax money, and about the numerous socialistic schemes to give us "security" while robbing us of our backbone.

—A.A.—

### FAIRS ARE COMING

Many of our readers make a sizable amount of pin money, have some fun, and gain some valuable information by exhibiting farm produce at County and State fairs. This is just a reminder that now is the time to lay plans for your crop and vegetable exhibits. Choose the right varieties to plant; pick a fertile spot to grow them, and resolve now to keep weeds, insects and diseases under control.

—A.A.—

### REPAIR PARTS

I have experienced several expensive delays because our local farm machinery agent failed to give dispatch to my order for repair parts. I resolved to have some system to overcome future delays. Here is the system, and I found it profitable on several occasions:

Prior to closing the deal for new farm machinery, I stipulated that a repair parts catalogue must be in my hands before I handed over the final payment. If more than one machine appeared in the catalogue, the one I purchased was to be plainly marked; also the date and year of purchase.

Why all this fuss? It is simply this: The manufacturers are continually making changes or improvements, thus you avoid mistakes, delays, and save valuable time in an emergency.

I purchased three second-hand wood letter-filing cabinets—one for letters, one for banking, such as cancelled checks, etc., and one for farm machinery catalogues and kindred subjects. I set aside a special place for all three cabinets and I try to avoid filing anything on top of them.—R. E. C., Endicott, N. Y.

## TEXAS RANCHER BEATS MASTITIS WITH PENSTIX®-SM

EULESS, TEXAS—Operating a 160-acre dairy farm and milking 35 Holsteins, Carl Horton has had plenty of experience with mastitis. Here's his story as he tells it himself.

"Some time ago I bought 42 cows to add to my herd. All but about a dozen had mastitis in a pretty bad way. It was so serious that I had to check the quarters of every cow carefully before milking each day.

"We started out by giving the infected cows PENSTIX-SM bougies—as many as four in the worst cases. This attack on the mastitis sure did wipe it out fast. We didn't have to ship a single cow out of the herd. I've been using PENSTIX-SM right along now... they're easy to use... easy to keep on hand.

"Occasionally we get wire cuts on teats... and I then insert WYETH Penicillin-streptomycin Ointment into the udder, also putting some on the outside to soften up the teats. The handy one-pinch tube is easy to use and it works wonders!"

CONSULT YOUR VETERINARIAN AS  
YOU WOULD YOUR PHYSICIAN

### WYETH'S PROVEN PRODUCTS FOR MASTITIS CONTROL

• PENSTIX penicillin bougies or PENSTIX-SM, penicillin-streptomycin bougies (the combined antibiotic treatment for more severe infections) are available at your drug, feed or Animal Health Products store.

• For cows with dry quarters, or with more deep seated infections, many dairymen prefer WYETH PENICILLIN OINTMENT or PENICILLIN-DIHYDROSTREPTOMYCIN OINTMENT, in handy easy-to-insert tubes. Write Wyeth for FREE mastitis booklet.

Wyeth  
Incorporated,  
Philadelphia 2, Pa.

## "ABSORBINE kept my horse at work"

says Martin Paul of Pewee Valley, Kentucky

• "I thought my horse would be laid up for a week with shoulder gall 'til I tried Absorbine. It helped give relief in a few hours. I'd recommend Absorbine to any farmer like myself."

Yes, there's nothing like Absorbine for

lameness due to shoulder gall, strains, puffs, bruises. Absorbine is not a "cure-all," but a time-proved help in relieving fresh bog spavin, windgall, collar gall, and congestive troubles.

A stand-by for over 50 years, it's used by many leading veterinarians. Will not blister or remove hair. Costs only \$2.50 for a long-lasting bottle at all druggists.

W. F. Young, Inc., Springfield, Mass.

## Letters to the Editor

### DON'T LIFT

I WAS interested in the item "Heavy Lifting" in the March 17 issue. Farmers have made progress in a lot of things but have fallen down on those lousy 100 lb. sacks of phosphate, cement and potatoes. Farmers, and others, don't have to wait to be 50. Ask any physician how many cases of rupture there are at 25.

Manufacturers of goods in 100 lb. sacks don't care if a man is ruptured. Some one will take his place, but the agonies, discouragements, actual failures in life, caused by rupture are terrific. I got the start of double rupture at 24 lifting sugar and barrels of crock butter (ye good old days) down from the tailboard of a wagon to the walk. I went into a New York City hospital with it. In my ward were 32 men, 19 of whom had hernia. It cost 8 weeks' pay, \$240 at that time; \$210 hospital and surgeon and a life of fear.

Farmers can halt it. It seems to me that farm organizations are strong enough to serve notice on distributors (give a year's notice) that after such a date they will not purchase a 100 lb. bag of anything, and you bet it will stop. A ruptured man is half dead—his freedom to work naturally is gone. Manufacturers of bags should like the idea it seems to me.—W. B. Lewis, Machias, New York.

—A.A.—

### NO ODOR?

I HAVE an idea this trick might be of help to others as I am of the opinion it was the key to my great problem of late.

The other evening a stray skunk unfortunately fell into our cellar while near an open window. We were not sure how to remove the guest without a little undesired trouble, so we tried putting bits of canned salmon left from supper on a long plank and letting the plank down through the window into the cellar. After leaving it there about one-half hour, we looked to find much of the salmon gone all the way up the plank and also the skunk. No trouble at all! —Mrs. Reginald Richardson, Spencer, Mass.

—A.A.—

### OLD STRAW STACK BOTTOMS

HERE is my way of putting old straw stack bottoms to use by planting potatoes in them. Where the straw is eight or nine inches thick, I simply raise the straw and plant the potatoes on top of the ground, and let the straw down again. The potatoes grow up through the straw, require no weeding, produce well even in the driest years, mature early, and are very good in flavor.

This method also works well with watermelons, squashes, pumpkins, etc.

—I. W. Dickerson

—A.A.—

### WANTS OLD BOOK

FOLLOWING is a verse of a poem published many years ago and set to music. My parents had a copy of the book and when I was about 10 years old I memorized the poem from hearing mother say it. If any reader of AMERICAN AGRICULTURIST knows where there is a copy of the book containing this poem I would like to buy, borrow or beg a copy so that I could see it again.

—George Proper, Summit, N. Y.

### MOTHER'S DYING LOVE

The cold wind swept the mountains high,  
And pathless was the dreary wild.  
Amid the cheerless hours of night  
A Mother wandered with her child.  
As through the drifting snow she pressed  
Her babe lay sleeping on her breast.

# Successful Crops DEPEND on WHAT'S IN THE SOIL...

## CHLORDANE

in the soil

EFFECTIVELY CONTROLS destructive  
soil insects... increases crop yield!

Throughout the New England States, in thousands of successful applications... chlordane has proven effective in controlling destructive soil insects that cause thousands of dollars in crop losses yearly. Proper application of chlordane as a fertilizer admixture, wettable powder, dry dust, or water emulsion sprayed on soil has often been the determining factor between success or failure of a crop... has resulted in greater crop yield too! The wide variety of destructive soil insects found in the New England States can be economically and effectively controlled with chlordane!

## HERE'S HOW...

Chlordane protects your crops from these destructive soil insects..

**WIREWORM**—Over two years of successful commercial use has again proven chlordane effective in controlling wireworms, with no reported off-flavor or odor detected in the harvested crops. In many cases, stimulated plant growth has been reported where chlordane is used as a soil insecticide.

**CABBAGE MAGGOT**—New developments in maggot control on cabbage and similar crops points to the use of chlordane dusts or sprays on the soil around newly set plants for effective control. Another method of application is by the use of chlordane fertilizer admixtures applied at transplant time.

**SEED CORN MAGGOT**—Seeds attacked by the seed-corn maggot usually fail to germinate. Tests have shown that effective control of the seed-corn maggot can be obtained by the application of chlordane formulations to either the soil or to the seeds themselves.

Chlordane also EFFECTIVELY CONTROLS these destructive soil insects... Japanese beetle larvae, onion maggot, white grub.

If the EFFECTIVE CONTROL of destructive soil insects is your problem... chlordane is your solution!

# Animal Agriculture— Answer to Surpluses

**I** HAVE just returned from the first conference of "The National Institute of Animal Agriculture." Held at Purdue University at Lafayette, Indiana, it was set up to perpetuate the ideas and plans of Ed Babcock as developed by him in talks and articles, many of which appeared over a period of years in AMERICAN AGRICULTURIST.

Without attempting to go into all details here are a few of the highlights:

1. The best way to handle so-called surpluses is to store food "on the hoof" or in refrigerators rather than to store grain in bins at taxpayers' expense. When properly handled, surpluses vanish; crops fed to animals "upgrade the diet." Fewer but better pounds of food result and consumers prefer meat, milk and eggs. Furthermore, Animal Agriculture furnishes a cushion against hunger. In an emergency, the animals, as well as the grain they eat can be consumed as human food.

2. The "Ever Normal Refrigerator," a phrase coined by Ed Babcock, is directly dependent on animal agriculture, which in turn, is one of the best known means of practical soil conservation. Animals and grass go together and grass prevents erosion, adds humus to the soil and helps increase fertility.

3. Animal Agriculture makes countless jobs. Meat, milk and other animal products must be produced, refrigerated, transported and sold. And all the equipment needed for these tasks must be manufactured. All this is in addition to the labor needed for growing and processing the crops to feed the animals.

4. Finally, a nation, a substantial part whose food is made up of animal products plus plenty of fresh fruit and vegetables is better nourished, and has more initiative and is more alert than a nation whose diet is principally cereals.

The Northeast was well represented at the Purdue meeting. Among those who attended from the New York State College of Agriculture were: Dean "Bill" Myers, Dr. Herrell DeGraff, recently appointed as the Babcock Memorial Professor of Nutrition at Cornell; L. A. Maynard, Dr. Norman Moore; and Professor J. H. Bruckner, head of the Poultry Department.

Others from the Northeast included Carl Bender and Firman Bear of Rutgers University; Karl Butler and John Babcock of Avco Manufacturing Company; Johnny Huttar, president of the Poultry and Egg National Board; Charles Dickinson of G.L.F., and H. L. Cosline of AMERICAN AGRICULTURIST. Representatives of industry were there in force in the person of such men as P. O. Wilson, National Livestock Producers Association; R. C. Newton, Swift & Company; Tom Girdler, Republic Steel, and many others.

## Swapping Ideas

Formal talks were kept at a minimum leaving plenty of opportunity for discussion from the floor. But brief though the talks were, they covered a wide range of subjects, starting with recent discoveries in animal feeding and continuing through the effect of animal agriculture on soil fertility, its importance to the national economy and finally its vital contribution to human nutrition.

There was much talk about setting up permanent headquarters for the organization with a small staff to publicize the advantages of animal agriculture, both to producers and consumers. It was not done, but another con-

## DR. DE GRAFF MADE BABCOCK MEMORIAL PROFESSOR

**A** MERICAN AGRICULTURIST congratulates Cornell University and Americans everywhere for appointing Dr. Herrell F. DeGraff as first Babcock Memorial Professor. This professorship was established in the School of Nutrition at Cornell and will be supported by a \$500,000 fund now being raised.

Ed Babcock first began talking about better eating years ago on his page, "Kernels, Screenings & Chaff" in AMERICAN AGRICULTURIST, pointing out that most of us were feeding our animals better than we were ourselves and our families. He emphasized the idea that a right diet is based on "animal agriculture"—plenty of meat, all kinds of dairy and poultry products, supplemented and varied with fruits and vegetables.

With tremendous energy, which was largely responsible for shortening his life, Ed spread the idea across America, and it is destined to live and grow and improve the finances of farmers and the health of everyone.

A Professor of Economics in the College of Agriculture since 1940, and sympathetic to Ed Babcock's ideas, Dr. DeGraff is both by training and experience in the fields of agriculture and food economics, and his understanding of the dependence of adequate nutrition upon food production and distribution, ideally fitted to help to make Ed Babcock's ideas live on.—E.R.E.

ference will be held next year and further action may come then. In the meantime the work will be carried on by all interested agencies, including not only the many segments of agriculture, but by packers, manufacturers of farm machinery and supplies, doctors, nutritionists and others all over the country.—H.L.C.

—A.A.—

## ATTENTION, GRANGERS!

**O** N October 25, 1950, occurred the death of Albert Goss, Master of the National Grange and one of the great leaders of our times. A man of high ability, one hundred per cent sincerity and honesty, Albert Goss was completely devoted to the interests of agriculture and to the America he loved so well.

It is highly fitting, therefore, that the Grange is asking every subordinate Grange to add at least ten new members before June 30, 1951, as a memorial to their great leader.

Personally, Mr. Goss would not want any testimonial to his own fine work, but I am sure that he would be very proud of every Grange that added materially to its membership, thereby keeping the fine work of this organization marching on. There is not much time left before June 30. If you have not already done so, why not organize a committee or, still better, make every member of your Grange an individual committee of one to bring in a new member.—E.R.E.

—A.A.—

Although hormone treatment can bring virgin heifers into milk, it is likely to destroy their breeding ability.

# PURINA CHECKERBOARD NEWS

FROM YOUR PURINA DEALER

DIRECTOR, RESEARCH DEPT.

We are now in full swing with our "every other month" hog farrowing plan. Of course, this is contrary to the ordinary spring and fall farrowing that we recommend, but by getting litters every 2 months we can do a lot better experimental job at the Farm.

\* \* \*

Incidentally, at our fur-bearing animal unit we've been doing work with chinchillas for several years. Did you know that a female chinchilla gives "birth" to "babies"? She usually has two litters a year, one or two babies per litter.

\* \* \*

We've had some very good chick starting results that I would like to tell you about. Last December we started 1,000 straight-run New Hamp chicks that we hatched at the Farm. One pen (200) of these chicks averaged 1.66 lbs. at 6 weeks and had a livability of 99.5 percent. Livability for the 1000 birds was 99 percent with an average weight of 1.58 lbs. at 6 weeks.

\* \* \*

Our work with turkey broilers is continuing. A group of 12 week old Bronze turkeys were New York dressed for grading recently. They showed very good fleshing and finishing. I'll have a full report on this later.

\* \* \*

It's a little late to report this, but you might be interested to know that sub-zero weather did not discourage folks from Missouri and Iowa who visited the Farm January 29.

58 visitors made a tour of the Farm while the thermometer dipped to 8 degrees below zero. That day the Farm kitchen served over 1200 cups of coffee.

\* \* \*

Join me in our next issue of Checkerboard News for more doings at the Farm. I hope to have an interesting story for you about an old car that just wouldn't give up.

## Middletown, N. Y., Producer Gets Top Price for Eggs

**I**F YOU'RE producing market eggs, why not plan to develop a market that will bring you top prices? That's what S. H. Willcox-Jones of Middletown, N. Y., has done. His program brings him about 10c a dozen extra for eggs and premiums up to \$1.00 for dressed fowl.

Willcox-Jones claims no copy-right on the program he follows. He does not claim perfection in a marketing scheme, but his program is working, and has been functioning smoothly for several years. He maintains a flock of approximately 2,000 White Leghorn layers. 750 are housed in individual cages, the others on the floor. He sells both to local markets and through high class retail stores on Park Avenue. With these two outlets he's never stuck with a surplus—if one place doesn't want them the other always does. Also he has

been careful to take care of his customers in seasons when the demand is greatest.

Here's how Willcox-Jones has built a stable business that nets him a good income throughout the year:

1. During the fall and winter months the residential markets in New York City want large eggs. He finds them willing to pay a good premium for big eggs that are of top quality. He caters to their wishes.

2. In the summertime when the New Yorkers are away on vacation, his local trade picks up. Then he retails to steady customers, although he continues sending some eggs to New York.

3. He culls constantly and culls closely. Loafers that are fat and plump are dressed out and sold on his egg route. It means extra income for him, and customers are anxious for the birds he brings them.

4. He packs his topnotch eggs in attractive Layena cartons. Small and odd shaped eggs, and those with poor shells are sorted out and sold through other channels.

5. Starts a new brood of chicks every 3 weeks. This keeps his equipment working, equalizes his labor, and gives him approximately the same number of eggs to sell each week.

For 7 consecutive years the Willcox-Jones birds have been strictly Purina fed. Speaking of his operations he says: "Success in my kind of operation depends upon the kind of layers that will stand up throughout the year without slumps in production. My Purina program has been helping them do the job, and that's why I stay with the program year after year. It takes careful brooding and careful handling and feeding to develop pullets that will be real money-makers later on."

Pullet growing houses are equipped with wire-floored sun porches. By starting 300 pullet chicks every 3 weeks he has big eggs the year round.

# PURINA CHECKBOARD NEWS

## "Sure, Heifers Can Be Good Milkers"

**Young dairymen cooperating with Elevator Co. kept records and have proof it pays to grow heifers right.**

Robert Hinsdale of Sand Creek, Michigan, is a young dairyman, just getting started. But Bob has learned one lesson many older men have never learned: "Well-grown heifers can freshen when 2 years old, then can produce from 8,000 to 12,000 lbs. of milk in their first lactation." Bob thumbed through his D.H.I.A. record book to prove his point. "Here's Tubby. She produced 8,305 lbs. of milk. Kassey produced 10,173 lbs., Cook 12,752 lbs., B. B. 8,872 lbs., Red Jr., 8,542 lbs., Leone 10,461 lbs., and Connie 12,132 lbs."

Early in 1947 Purina Salesman Harold W. Schneider started a new type of dairy-improvement plan. Basic factor in the plan was to carefully select a group of progressive young dairymen and to organize them into Dairy Clubs.

Club members were to agree to do the following things:

1. Weigh the milk morning and night twice a month and keep accurate records.
2. Keep receipts for all feed bought.
3. Keep sales slips for milk sold.
4. Put the herd on a phase of the Purina Program.

Bob Hinsdale is a member of one of these Dairy Clubs. A few poor-producing cows in his herd were quickly spotted and culled. Primary results however came from a better program of management and feeding of cows while dry, and through a program of properly growing heifers.

A healthy spirit of competition to see whose heifers would produce best in their first lactation has given ample proof that heifers can be good milkers. Records are taken to Dairy Club meetings and are discussed among the members. At a recent meeting, in addition to

the Hinsdale records, the following were discussed:

K. Hoisington of Fowlerville had 3 heifers that had completed their first lactation. Heifer No. 5 had produced 9,572 lbs. of milk, No. 12 had produced 9,727 lbs. and No. 15 had given 9,123 lbs.

Dick Platt of Tipton had 4 heifers giving 11,635 lbs., 11,672 lbs., 9,310 lbs. and 10,863 lbs.

C. Emmons of Sand Creek had 4 heifers. Daisy had produced 10,175 lbs., Burke 9,873 lbs., Ruby 8,884 lbs. and Bell 9,167 lbs.

Clarence Emerson of Sand Creek had records on 6 heifers. Susan had produced 9,018 lbs., Pumpkin 10,007 lbs., Lassie 9,794 lbs., Bonnie 11,889 lbs., and Pride 10,871 lbs.

Glen Hoisington of Fowlerville had 3 heifers. One gave 9,214 lbs. of milk with 350 lbs. of fat, another 13,593 lbs. of milk with 482.8 lbs. of fat, and the third 10,452 lbs. of milk carrying 339 lbs. of fat.

## BUILD UP DRY COWS...

by ALBERT LEONARD  
Manager, Purina Dairy Chows

Dry cows are the hardest working animals in your herd, yet often receive the least help. Many dairy failures result from lack of care and conditioning during this important period. Thousands of good dairymen point to the following benefits where cows are properly conditioned:

1. They always give more milk during the next lactation. Nature protects the developing calf of poorly fed cows by taking minerals and vital elements from the cow's body. Varying with the breed, this cuts her production from 1,000 to 2,000 lbs. of milk.
2. Cows in condition settle promptly. Profit is cut when cows must be re-bred.
3. Cows in condition have less trouble in calving.
4. Caked udders, acetoneemia and congestion are common problems when cows are not in good condition.
5. Cows kept in condition last longer. Most cows in the East go to the butcher before completing 4 lactations. Cows lasting through 7 lactations bring in 50% more profit each year over feed and replacement cost than those lasting only 4.

Your local Purina Feeding Advisor is trained to advise just how cows should be conditioned for freshening.

Three nice-sized toms out of the second batch weighed 24½, 26, and 27½ pounds at 25 weeks. These were not the biggest ones. Purina man Bernard Mangum, an experienced turkey man, helped the Hoods get started.

## Turkeys Add to Farm Profits

BROTHERS M. L. Hood and his son Fay have been turning to turkeys and beef cattle to build more profits for their 350-acre farm near Sharon, S.C.

Cotton used to be the mainstay. Now they have 125 acres of pasture and raise grain. A beef breeding herd and 2,000 head of turkeys make good use of these crops.

Your Checkerboard News editor visited them last fall. Naturally I asked how they liked their new livestock-turkey system.

"Much better than cotton," agree the brothers. "We make more money for our work. And we're building our land - not tearing it down. As we get our land into better production, we may even be able to go into hogs."

Turkeys as a sideline for general farming offer so many possibilities, we went over their operations carefully.

The Hood Brothers and son Fay have been in turkeys two years.

Last year they started two broods, with about 1,000 poults in each brood. This required the investment of a brooder house, with hovers, feeders, and waterers. It was the biggest investment, next to poults and feed.

Poults are moved right from brooder to range. Here the investment in equipment is fairly small. Temporary fences covering only a few acres are used. These are moved once a week in wet weather - once every other week when weather and range are good. Feeders, water troughs and pole roosts are the only other equipment.

"Last year we used a Purina feeding plan that took about ⅔ of our own grain and ⅓ boughten Purina Chows," they told me. "The turkeys made a nice profit over feed cost and paid us a lot more for our grain than we could get by selling it straight."

The Hoods had just marketed their first batch of 989 turkeys. Hens were sold at 23 weeks old,

weighing an average of 11.8 lbs. dressed, or about 13 lbs. live. Toms went at 25 weeks weighing 20 lbs. dressed, or about 23 lbs. live. These are very fine weights for turkeys at this age and are far better than the average for the country as a whole. They indicate an unusually low feed cost, because fast-growing birds always make better use of their feed.

Milo and oats are the grain crops used for turkeys. Hoods like milo because they can plant it late, after other work is over. They cultivate only twice. Turkeys like it as well as corn and do as well on it. Turkeys harvest part of the crop, and do a clean job.

## BOOST BROILER RAISING PROFITS

by HOLLIS H. BROWER  
Manager, Purina Broiler Chows

The first question usually asked after a brood of broilers is sold is: "How much did they bring?"

The price is naturally important, but as a producer the market is almost entirely beyond your control. It may strike you as strange, but there are four big factors over which you do have some control. We state them as questions. You need not answer us, but your results must be in line or competition will plow you under.

1. How many of the chicks started will reach market?
2. How big will these birds be on market day?
3. How many days will it take to get them ready for market?
4. What will be the cost of producing each pound of broiler meat?

Through using good chicks under good management some of your competitors are selling 95¢ of every 100 chicks started. If mortality of your chicks exceeds 5 per cent your profits suffer.

On market day the little ones as well as the big ones get weighed. Birds that grow fast and are uniform always bring more money.

Most of the feed older birds eat is burned up in supplying heat and energy. Each day saved in getting birds to a specific weight saves some on labor, but there is a big saving on feed.

About 60% of your cost is in feed. Growers following a good program are producing 3-pound-average birds in from 9 to 10 weeks and on less than 10 lbs. of Broiler Chow. By holding cost per pound low they are boosting their broiler-raising profits. They figure high production costs will cause competitors to run for cover, allowing market prices to maintain a level that will keep them in business.

## Big Pullets Pay You More!

When a pullet will lay is largely determined by breeding, and what you feed her can not advance this bred-in age.

Improper feeding, however, can certainly delay the date of the first egg and reduce the number of early eggs you get.

Pullets that are big and well-developed at the time of the first egg can mean extra earnings in these two ways:

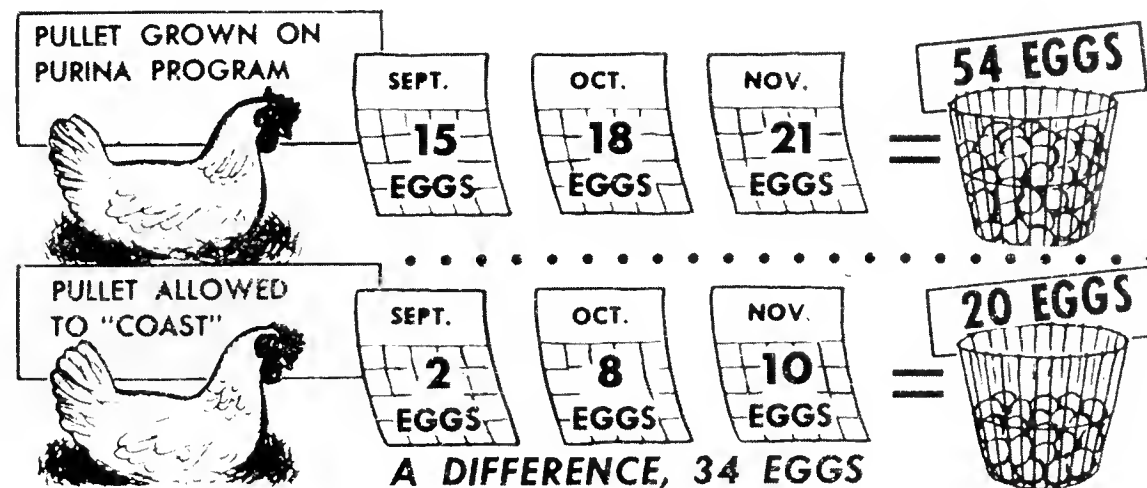

1. All the laying ration can be used to make eggs and to keep the pullet's body in condition. No feed is wasted in completing the pullet's growth after she starts laying.

2. Pullets that are fully developed at the time of the first egg

usually have a long and hardy laying life. This means more eggs over a long period of time.

Our research shows that the right combination of growth ingredients

helps you get big pullets. Formula 1028, Purina's right combination of Antibiotic, B<sub>12</sub> Supplement, and Growth Vitamins, has been added to 1951 Purina Growing Chows.

## HOME HANDIES

Pretty shelf edgings are easy to make. Just cut bright cloth into strips with pinking shears, tuck onto shelves.

Here's a Home Handy from Mrs. J. M. Roberts, Jackson, Miss. Make "slip covers" for your pot pads, so you can easily slip them off for washing. The covers dry much quicker than the whole pad.

# PURINA CHECKERBOARD NEWS

## Fly Trouble Costs Dairymen Plenty

USDA reports show that dairy animals bothered with flies may drop as much as 50% in milk production. This, coupled with a big body weight loss, amounts to a pile of money to dairymen.

Purina Research offers a fly repellent that kills insects and is recommended for use by dairies. Purina Dairy Spray effectively kills stable flies, horn flies, house flies and mosquitoes thus reducing irritation to dairy animals.

Purina Dairy Spray is made to be applied as often as necessary. Morning applications are preferable as cows are then protected and more comfortable during the day while grazing.

Four or five sprayings build up protection making fewer applications necessary.

Rid your cows of these wasteful pests. For low-cost, thorough fly control see your Purina Dealer for Purina Dairy Spray.

## SEE THE DIFFERENCE GOOD GROWTH MAKES AT YOUR PURINA DEALER'S PULLET DERBY

It's Derby time again! The Purina Pullet Derby is on in hundreds of stores with the Checkerboard Sign across the country.

The pullets have started their growing race right in the stores. Purina Dealers are presenting them as an educational feature for their communities. They want to show how big, well-developed pullets lay big eggs and more eggs in the fall when egg prices are highest.

There's no handicap in the race. All pullets are fed the same—on Purina Growena or Purina Growing Chow and grain. Drop in and see them soon. There's no obligation—nothing to buy. Every poultry raiser is cordially invited.

Mr. Green and some nice leaf lettuce that was ready for market early in March.

## Indoor Farming in Schenectady County, N.Y.

**A**ROUND 4 acres all under glass is a farm in itself. I saw such a "farm" a few weeks ago and was so intrigued that I am passing along some of the unusual features to you. I found it just outside of Schenectady, N. Y., on the road to Troy, and it goes under the name of "Brownsey and Marks." It is being managed by Mr. Green, one of the partners. It takes 9 men to do the work, and about 1,000 tons of coal to provide heat during the winter.

In early March when I called there, leaf lettuce and radishes were two of the important products being marketed. Twice a week a load goes to Menands market, and twice a week to the Schenectady market. A load is about 60 baskets of lettuce and 20 of radishes.

Tomato plants were now in bloom and tied up on strings. These tomatoes will go to market and bring a premium price before field grown tomatoes are ready. Cucumbers which have been started in baskets were being transplanted when I was there. They will be harvested from early April until about the 4th of July.

### Year Round Work

In addition to the greenhouse vegetables sold, there is also quite a business in growing plants. For example, Mr. Green told me they often sell 100,000 tomato plants a year and set out about 14,000 on their own farm. In addition to the greenhouses, they grow 75 acres of vegetables during the summer. As a result of this combination of greenhouse and field crops the labor force of 9 men can be kept busy the year round.

Naturally there is the problem of maintaining fertility in a greenhouse soil. It is no longer possible to buy horse manure, but they do buy about 30 loads of cow manure a year and pay \$8 for a load of 3 or 4 tons. They also use about 5 tons of commercial fertilizer each year in the greenhouses. In the houses where crops grow on the ground, as in the case of tomatoes, the ground is worked up with a rototiller after the harvest. Lettuce is grown on benches.

I was interested to find that greenhouses are not idle very long during the year. For example, the harvest of cucumbers will run up to the 4th of July, and then before the end of July

other crops are sown for harvest late in the fall after field crops are through.

The ground under the tomatoes was heavily mulched. As a result of my question, Mr. Green said that this keeps the ground from drying out and the dirt from spattering when the tomatoes are watered. The mulch is also used under cucumbers. By the time the crop is harvested, the mulch will be sufficiently decayed so it can be worked into the soil, thus adding to its humus supply.

Some of the greenhouses on this farm have been there for 50 years. As far back as 1912 there was less than one-half acre under glass, but the area was gradually expanded until it reached an area of about 4 acres around 1935.

Growing vegetables in greenhouses is farming all right, but it is a different kind of farming than most of us have been familiar with. Like every other type of farming, it has its peculiar problems with plenty of opportunity for using one's head.—H.L.C.

—A.A.—

### MEASURED LOGS INCREASE PROFITS

**W**OODLOT and timber land owners whose trees were damaged in last November's windstorm can receive more income from these logs if they are sold on a measured basis, rather than by lump sum sale.

The State College of Forestry at Syracuse offers a free illustrated booklet to help owners and dealers in measuring logs. The booklet contains simple instructions and several common log rule tables, including the Doyle rule, most popular in New York State. Other log rules tabulated are the Scribner, International, and Glens Falls (Dimicks) Standard.

"All a woodlot owner needs for measuring logs is an ordinary yard stick, and a notebook to tally the logs and their contents in board feet. Here's all that has to be done: measure the length and the diameter of the small end of the log; refer to the table in the booklet, which gives the number of board feet of lumber that may be sawed from that log; tally each log's board foot content in the notebook.

A copy of this free booklet, "Log Scaling," may be obtained by sending a post card request to the Department of Forest Extension, College of Forestry, Syracuse 10, New York.

## Prepare Now for a NON-STOP Harvest

### Start and Finish on Time With Your Own ALL-CROP Harvester

This year a non-stop harvest is doubly important. Every bushel of grain and seed is needed to bolster our national strength.

Fortunate is the farmer who has a home-owned ALL-CROP Harvester. Never again will he need to cut too green, or wait his turn with crops exposed to the weather. He can harvest at exactly the right time — when kernels are heaviest.

Wise is that same ALL-CROP owner who recognizes the value of his investment, inspects his ALL-CROP carefully now, and makes sure every part is at peak operating efficiency. Full-width rubber-faced cylinder bars and concaves, rubberized drapers, V-Belt drives, close-cutting sickle — all are key points in the ability of the ALL-CROP to harvest over 100 grains, beans, and soil-building seed crops.

Think ahead to harvest time. Are you ready? Your Allis-Chalmers dealer will gladly help you plan a non-stop harvest . . . if you consult him now.

ALL-CROP and ROTO-BALER  
are Allis-Chalmers Trade-marks.

**L** Reduce dockage by installing a ScourKleen attachment. It removes weed seed and polishes the grain as it is harvested — all done automatically.

**2** New auxiliary motor is interchangeable with four A-C machines: ALL-CROP Harvester, ROTO-BALER, Forage Harvester and Blower. An easy change-over for one man, with chain hoist. Enables smaller tractors to operate full-size harvesters.

## SAVE Labor — LOWER Your Up-Keep Costs with the

### LONG "50" Automatic Pick-Up HAY BALER

At last you can own an automatic pick-up hay baler with low upkeep costs. . . . A baler that makes square, compact, tightly tied bales, too! A special feature found only on the LONG "50"—the automatic bale tension bar—makes this possible. It's been tested and proven in the field, too!

See the LONG "50" before you buy. You will like its efficient and economical operation. For more detailed information on how the LONG "50" will save labor and lower your upkeep costs, WRITE TODAY.

## Can a 15-Cow Herd Afford D.H.I.A.?

By CLARENCE H. PARSONS  
Extension Dairyman,  
University of Massachusetts

**H**OW MANY times have I heard a dairyman with 12 to 15 cows say, "Yes, D.H.I.A. is a good thing for the fellow with a large herd. He can afford it. If I had more cows, I would be interested in joining." On the other hand, it may be that a herd owner with 20 to 30 cows has a large enough business so that he can afford to carry a "boarder" cow better than an owner of a small herd. If one has only 12 or 15 cows, it is most important that each one pay its way.

Recently a monthly D.H.I.A. report for the state of Iowa came across my desk. I was most interested to note that in a state with 1,895 herds on D.H.I.A. test, the average size of herd was only 19.1 cows. If the average is 19 cows, there certainly must be a very large number of herds of 15 cows or less that are on test in Iowa.

The average of all cows reported on D.H.I.A. in Massachusetts for 1949 was 9,000 pounds of milk and 360 pounds of fat with a test of 4%. The comparable average for Iowa was 8,666 pounds milk, 344 pounds fat with a test of 4%. It would appear that the average production per cow is slightly higher in Massachusetts than in Iowa. Furthermore, the price received per hundred weight of milk in the Northeast is much higher than in the Midwest. If with lower average production per cow and a lower price for milk, Iowa dairymen with small herds find D.H.I.A. profitable, it would seem that Northeast dairymen with small herds could certainly afford to test.

The question arose, "Do we have many small herds on D.H.I.A. test in the Northeast?" As a partial answer to this question, the herds in Massachusetts have been tabulated as follows:

### D.H.I.A. Herds—Massachusetts

Size of Herd	No. of Herds	% of Total
Less than 15	90	16%
15 to 19	87	16%
20 to 24	93	17%
25 to 29	72	13%
30 to 39	87	16%
40 to 49	54	10%
50 to 74	50	9%
75 to 99	16	3%
100 and over	11	2%

Massachusetts has a comparatively large number of big herds enrolled in D.H.I.A. test. In this state, 26 of the herds on this form of testing have 75 or more cows. The average for all herds is 31.6 cows—this is 12 cows per herd more than the Iowa average. It will be noted that one-sixth of all the herds on D.H.I.A. in Massachusetts have less than 15 cows; another one-sixth have

between 15 and 20 cows; and half of all the herds testing have less than 25 cows. It is obvious, therefore, that a substantial number of dairymen with small herds are finding it worth while to test.

In Massachusetts, the monthly cost of testing for a herd of less than twenty cows is approximately \$8.00. This is just under \$100.00 per year. The tester has to locate only one boarder cow to pay the entire testing cost for one year.

But is there much chance of finding a boarder cow in a herd of 12 or 15 cows? An interesting study was made recently of eight Holstein herds that had a yearly average per cow of 7,775 pounds of milk and 287 pounds of fat. These herds comprised a total of 86 cows or only 11 cows per herd. An analysis of the level of production of these cows was revealing.

Average Production Per Cow	No. of Cows	% of Total
over 11,000 lbs.	6	7
10,000 — 11,000	10	12
9,000 — 10,000	5	6
8,000 — 9,000	18	21
7,000 — 8,000	14	16
6,000 — 7,000	14	16
5,000 — 6,000	9	10
under 5,000 lbs.	10	12

It will be noted that one out of 10 cows in these herds averaged less than 5,000 pounds of milk and one out of every 5 cows averaged less than 6,000 pounds of milk. Who would challenge the statement that a Holstein cow that makes less than 5,000 pounds of milk a year is losing money for its owner? In fact, how many dairymen can break even on cows that produce less than 6,000 pounds of milk?

The average production of all cows in Massachusetts in 1950 was approximately 6,500 pounds of milk and 250 pounds of fat. If one of every five cows produced less than 6,000 pounds per year in the herds that averaged 7,775 pounds of milk, the chances are that at least one out of every five cows in the average herd produces less than 6,000 pounds. And remember, a tester has to find only one boarder cow a year to pay for his cost.

Almost any dairyman with 15 cows will find that D.H.I.A. will more than pay just to determine which cows are profitable and which are not. In addition, the production records are a most important guide in determining what heifer calves to raise. Perhaps the most important value of all is the increased interests that a herd owner takes in his cows when he knows what they are producing.

### SCHOLARSHIP WINNER

Richard M. Thomson, 17, of Star Route, Delmar, N. Y. demonstrates his own science project, "Design of a Stellar Photometer and Other Optical Instruments" at the science exposition staged by the 40 finalists in the 10th nation-wide Science Talent Search. Richard and 39 other high school seniors, who were chosen in stiff nation-wide competition, attended the five-day Science Talent Institute here and competed for \$11,000 in Westinghouse Science Scholarships. Richard was one of eight finalists awarded a \$400 Westinghouse scholarship. At school, he plays in the orchestra, is president of the National Honor Society and is a member of the Student Council. Richard plans to attend Cornell. His father, Dr. William M. Thomson, is head of the N. Y. State's Bang's Disease Control Laboratory at Albany.

# Retired, But Still Active

By L. E. WEAVER

It has been a long time since I have told in this column about my poultry plans. There has not been much to tell, because I have had no chickens. My poultry house has been rented for the past three years; likewise the barn. It was once a dairy barn but has been filled of late with laying hens, both basement and barn floor. The crop land has been rented to another neighbor.

But everything has changed this spring. One renter is moving to a place of his own, the other has reduced the scale of his operations. Faced with this situation it seemed that the logical next move for me was to retire from my work in the poultry department at Cornell and see how far a college professor can actually get when he attempts to practice what he has been preaching.

For years I confidently expected to retire the minute I reached the required age. Then when I got there two years ago, I found it so hard to make the plunge that I didn't do it. But since the first of April I have been on retirement, free and unhampered. I can go and come as I please, and say what I please—within certain limits.

The editors have asked me to continue to write this column and I expect that you who read it may get many chances to smile at some of my dreamy-eyed notions. Probably you can say of the mistakes, "I thought it would turn out that way." I hope some of you will send warnings when you

see me heading into a costly blunder.

So far since my retirement, these have been my accomplishments:

1. Persuaded one of my Inlet Valley neighbors, "Boots" Poelvoorde, whom you have read about in the "Kernels, Screenings & Chaff" page, to fit the back two fields of the farm and sow the 26 acres to oats.

2. With the assistance of Dr. F. B. Wright of Cornell's Agricultural Engineering Department, a 20-foot litter carrier or conveyor has been designed and built. With it I am hoping to clean out the unbelievably large supply of dry built-up litter that I didn't want piled out in the weather. Now it will go on the 24 acres at the front of the farm which Boots will eventually put into field corn for me.

3. I've been to a doctor, had a check-up and have his report that physically there is no reason why I shouldn't be as active as I wish, so long as I am reasonable about it.

4. I have spent a lot of time thinking and reading and asking questions about the broiler business and White Plymouth Rocks. Sometimes I will go into the reasons for my long-time interest in that variety. I would like to accept the breeding challenge that it presents, but I don't want to run myself into red ink to do it.

Just now the broiler-feed ratio is not very favorable and the earliest I can get the strain I want is the last week in May. Hot weather slows down the rate of growth of chicks and therefore runs up the cost of growing them. In spite of those unfavorable angles I will probably not be able to resist the urge to get the brooding plant cleaned up, tuned up, and put into operation.

— A.A. —

## APPLES FOR HENS

I was rather interested in a recent article on feeding apples to dairy cows. I wondered why no one mentions apples as a feed for hens. I have fed a bushel of apples to a thousand hens per day for several winters and I believe that a limited quantity acts as a tonic and conditioner while adding a green feed to the diet. I scatter a few apples in the mash feeders at noon. The hens pick the apples and eat quite a bit of extra mash at the same time.—H. L. Stahlman, Valatie, N. Y.

— A.A. —

## HIGH PRODUCTION PAYS

Regardless of the breed of poultry, high rates of production are important in determining profits. With heavy breeds each increase in production of a dozen eggs per hen reduces the average cost about 2.4 cents per dozen; with light breeds the decreased cost amounts to 2.2 cents for each dozen increase in production. Without high production all other desirable practices will not bring forth low costs or good returns.

— A.A. —

## DRESSING DUCKS

Here is a suggestion for dressing ducks. Put one of the detergents such as Dreft, Cheer or Tide in the scalding water. It seems to cut the oil in the feathers and allows the water to penetrate through them.

We are amateurs at picking ducks but my husband killed and picked three ducks in twenty minutes with a little help from me on finishing.—Mrs. C. H. Pratt, Westport, N. Y.

— A.A. —

## STIRRING LITTER

To keep the litter in your brooder house or laying pen in good condition, try using your "garden cultivator" to stir it. You'll find it much easier and quicker than using a fork or rake.

—Andrew J. Smith, Groton, Vt.

## The Question Box

**Are tractor tires loaded with water more efficient than wheel weights?**

Early experimental work has indicated that tires loaded with water with an air cushion in the tire is the most efficient arrangement. However, there has been experimental work done recently by the U. S. Rubber Company and the U. S. Department of Agriculture co-operatively which indicates that wheel weights are a little more efficient than having the tires filled 79% with water.

According to these tests made on loam, the maximum drawbar pull for the air filled tires with wheel weights was 1133 lbs.: for tires filled 79% water and with air cushion was 1085 lbs.: with tires 100% filled with water was 1050 lbs. With the air filled tires, wheel weights were added to put the same weight on each wheel as the weight of water with the tire filled 100%.

If you wish to do so, you can get a copy of the report of this work by writing to I. F. Reed, Senior Agricultural Engineer, Division of Farm Machinery, U. S. Department of Agriculture, Tillage Machinery Laboratory, Auburn, Alabama.—Paul Hoff.

**Is there any solution to the problem of mowing ladino clover early in the season?**

A number of farmers have found that the best way to handle ladino is to pasture it early and then to let it grow for hay or grass silage. Some farmers have told us that ladino which is pastured early, and therefore mowed somewhat later, gives much less trouble than when it is allowed to grow without pasturing.

**I would like to know why my wisteria vines fail to flower.**

There may be several reasons involved. The first is that flower buds are subjected frequently to late spring frosts which injure and kill them before flowering takes place. Another possibility, and a very likely one, is that the plants were grown from seed, and many seedling forms of wisteria do not flower freely, particularly as young plants. Often the flowers, when they do bloom, are small and disappointing in terms of horticultural varieties illustrated in the trade magazines and frequently seen in other gardens.

A third possibility is that the soil is too rich or that too much of a nitrogenous type of fertilizer has been used so that the plants are forced into excessive vegetative growth. Pruning back the ends of the shoots so as to leave a stub 5 to 6 inches long with two or three groups of leaves often induces flowering. Another way is to take a short piece of wire up to a foot in length that is relatively pliable and to wind this around the stem near the

ground in the same fashion that the red stripes appear in a barber pole. Such spiral girdling often interrupts the flow of the food from the top of the plant to the roots and encourages enough carbohydrates to remain in the top of the plant to stimulate flowering.

My suggestion would be that you try this last suggestion and, if this does not bring about flowering in the next year or two, you might then purchase some grafted plants and try them out in your location, particularly if your neighbors have wisteria that flowers freely year after year.—A. M. S. Pridham, College of Agriculture.

**Should raspberries be cultivated and, if so, how long? Is manure or commercial fertilizer best for berries?**

You should continue to work the berries between the rows, otherwise the suckers will spread between the rows and you will soon have an unmanageable thicket of canes. The berries should be worked from as soon as the soil is suitable in the spring until about the end of July, after which the weeds should be allowed to grow or a cover crop should be sown. If you work the berries in late summer and fall it will stimulate late growth and the canes may winter-kill much worse than if you discontinue cultivation at that time.

Cow manure is an excellent fertilizer for raspberries and may be used at the rate of around 10 tons to the acre. If you are getting pretty good cane growth, you may not need this fertilizer every year. If you do not have manure available, ammonium nitrate at the rate of about 150-200 pounds to the acre should be satisfactory, or nitrate of soda at half that rate.

When you work the berries you should cultivate as shallow as possible to prevent injury to the roots of the raspberry plants. — George L. Slate, Geneva Experiment Station.

**Do extra teats on a heifer do any harm? How can they be removed?**

Ordinarily they are not harmful, but they are unsightly and occasionally such an extra teat will actually produce some milk which, of course, is a nuisance.

These extra teats can be removed between the ages of one month and a year. Just disinfect the area around the teat with iodine before and after the operation and remove it close to the udder with a clean, sharp pair of scissors.

**What is the best way to remove wax from a floor before painting it?**

Wash it thoroughly with gasoline or turpentine.

### ALFALFA FOR CHICKENS

Chickens eat alfalfa leaves as this bale is unrolled. Leftover stems build up floor litter.

To feed rolled bale alfalfa, just push a sharpened one-foot length of broom handle into the center of each end of the bale. A long metal bolt will do as well as a broom handle. Suspend the bale from the rafters or other convenient support. Two pieces of bale wire will hold the bale.

Unroll the top layer of alfalfa to the floor, and watch the chickens dig for protein-rich leaves.

Can Give You a  
**75% Saving**  
on Fuel Costs

$\frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$   
THE FUEL THE PRICE THE COST

**Plus AN 8 SPEED TRANSMISSION**

that provides a wider range of gears to insure maximum speed for each type of work. The Sheppard transmission provides complete flexibility of power. It has 2 speeds slower than most other tractors. These slower ground speeds prevent clogging and choking of combine or harvester in heavy crops. A wider range of 4 plowing speeds allows an accurate choice of gears to fit varying soil conditions. 2 road speeds, 1 for fast hauling from the field, 1 for pulling up heavy grades without dropping back into a field gear, saves time on all farm transportation.

CARL SCHLENKER  
Texas, says,

"The Sheppard Tractor is to me everything that I have been looking for in a tractor since I have been farming."

If you are looking for something extra in a tractor, you can't beat this combination: A Sheppard Diesel's 75% fuel cost saving; an 8 speed transmission; and independent power take-off. A Sheppard Diesel . . . and only a Sheppard Diesel . . . gives you all 3 in a single tractor. Send for literature that describes many more unusual Sheppard Diesel features.

Mail Coupon Today

**Plus AN INDEPENDENT POWER TAKE-OFF**

The Sheppard transmission and an independent power take-off is an unbeatable combination for combining or harvesting heavy crops. Constant, full power on the take-off at ALL ground speeds practically eliminates choking and clogging of combine or harvester. On the rare occasions when it is necessary to stop the tractor to clear combine or harvester, full throttle power continues on the take-off without interruption.

**Plus BIG, DISK BRAKES**

for greater safety when handling heavy equipment on grades or slopes. Self-energizing, they provide positive control for quick stops . . . short turns . . . with less braking effort. Fully enclosed, easily adjusted.

**SINOX PE** CONTROLS WEEDS  
IN BEAN FIELDS  
by PRE-EMERGENCE  
CHEMICAL SPRAYING

SINOX PE, a water soluble dinitro spray material, gives the best obtainable residual weed control in snap, kidney and lima beans. Excellent results have been obtained in Delaware, New Jersey, Long Island, Michigan and New York with SINOX PE in soils ranging from light sandy to heavy loam types.

One gallon of SINOX PE per acre gives good residual weed control for at least four weeks and usually eliminates two cultivations. Weeds controlled by SINOX PE are: Mustard, Lamb's Quarter, Ragweed, Pigweed (red root), Purslane, Wild Radish, Chickweed, Smartweed, Wild Lettuce, Shepherd's Purse and Wild Buckwheat.

See your dealer or write today for SINOX PE Spray Bulletin.

## ADDITIONAL ADS

(Continued on Opposite Page)

By J. F. "Doc" ROBERTS

THERE is still hope that our whole livestock industry will not be ruined by government politicians the way they ruined our sheep, lamb and wool industry.

On June 30 these politicians will lose their authority, and unless Congress votes it back to them we can again build an industry of greater production to meet a greater demand—perhaps an emergency demand—without fear of unfair, foolish restrictions. Worst of all is the fear that a few politicians may do to all of us in the livestock industry what they have already done to others and are talking about doing to us.

At the annual meeting of the Producers Livestock Commission Company of Buffalo, men from other states brought out that from 25 to 30 of the largest livestock groups in the country are working together to show Congress that it is impossible to control livestock and meat prices. This is because there were so many angles entering into livestock production, so many grades, transportation, processes and distribution necessities in handling meats.

Here are some of these angles and necessities: Livestock production regu-

lates the price of grain; it has a tremendous influence on land values, and therefore on taxes; it goes into steel production for fences and machines; it is the greatest contributor to our railroads; it carries on into our clothing, shoes, medicines, oils. All this and much more.

Meat grades and distribution are even more complicated. The average pound of meat eaten anywhere in this country travels over 1,000 miles and must be distributed evenly everywhere in the country. There are over 2,000 different cuts, grades and processes of the different meats. Health regulations are severe and must not be lost sight of, nor should the medicines which are more and more an important by-product of our animals.

This gives you just a bare outline of why it is impossible to freeze, price-control, ration, or regulate our livestock and meat industry through politicians. It also shows why even just "talk" of such things is so harmful.

The general farmer, the livestock farmer, the dairy farmer, the transportation people, the processor and distributor, every food retailer, and every consumer—all have a powerful reason right now to join together and see that Congress does *not* place this power to ruin the industry back into the hands of a few politicians after June 30 of this year.

\* \* \*

Our pastures are made for this spring; over-made if you have had all the rain that we have had! I would rather see it now than later when it could produce a sloppy, wet grass—not good for man or beast.

With the tremendous demand for meat continuing, with prices higher,

and with the shorter spring season coming up, there is every reason to get every pound of gain possible on your livestock before marketing. Anything you plan to market soon, keep in the barn or barn lot on dry feed. Livestock will shrink in weight the first few days or even weeks after it is turned on grass, then it will dry out and become used to green, lush feed, and gain faster than in any period of its growth. Our May and June pastures are a thing we can all be proud of.

— A. A. —

## SULFUR DIOXIDE FOR GRASS SILAGE

THE preservation of high protein grass as silage is a much greater problem than the preservation of corn. If all the rules are followed, it often comes out good without any preservative, but all too often it comes out with an odor objectionable to the farmer and also to his wife. In spite of the odor, the stock will usually eat it but occasionally they will not.

Much research is being devoted to the preservation of grass. The ideal that everyone is striving for is a product, dry or wet, that contains all of the nutritive values in fresh green grass. This is the target, but we will never make a perfect bull's eye.

Everyone knows that a highly desirable ensilage can be made from grass with the use of molasses, corn and cob meal, beet pulp, citrus pulp, ground wheat, etc. The use of these this year will involve heavy cash out-of-pocket cost at a time of the year when the dairyman is short of ready cash. Since the actual loss in feeding value is very small, the actual charge for preservation is low in spite of the high out-of-pocket cost.

This year a new preservative for grass silage—sulfur dioxide—is making its bow. It is highly recommended by Dr. C. B. Knott of the Dept. of Dairy Husbandry at Pennsylvania State College. Sulfur Dioxide has no food value in itself, but there is a possibility that it may reduce the losses that ordinarily take place in the silo. The recommended rate is five pounds per ton of silage. The cost of this amount will be about one dollar.

Sulfur dioxide is a gas at ordinary temperature when not under pressure. It can, though, be compressed to a liquid. It will be delivered to farmers as a liquid in steel cylinders, the pressure it exerts within the cylinder being sufficient to force it into the silage.

Whether or not we have in sulfur dioxide a better preservative than those now being used remains to be seen. A goodly number of large scale farm trials in addition to further research is needed this year. The grass silage that the writer has seen that was made with it has been excellent. It has also been fed liberally to cows at Pennsylvania State College without any ill effects to their health or any indication that it might lack palatability. Those wishing more information on it should write to Dr. C. B. Knott, Department of Dairy Husbandry, Pennsylvania State College, for a copy of the mimeographed bulletin "Sulfur Dioxide Preservative of Grass Silage."

## HEIFER ADDS \$400 TO BABCOCK MEMORIAL FUND

At the recent Brown Swiss Sale at the N. Y. State College of Agriculture a heifer owned by Mr. and Mrs. Jack Conner of Ithaca sold for \$400. The heifer was donated to the sale with the stipulation that the proceeds be turned over to the H. E. Babcock Memorial Fund. The calf was purchased by Harris Wilcox of Rochester.

The H. E. Babcock Memorial Fund is being raised to endow a professorship in food economics in the School of Nutrition.

HIGHEST CASH PAID for old, broken jewelry, gold teeth, watches, silverware, diamonds, spectacles. Free information. Satisfaction guaranteed. Government Licensed. Rose Smelting Company 29-AA East Madison, Chicago.

# WEDDING *in the Family*

By  
**LUCILLE SEGUIN**

In the excitement of opening so many gifts, it would have been impossible to keep track of who sent them if they had not been immediately numbered and listed in a book.

LONG distance telephone call followed by a lengthy letter was my initiation into the fraternity of mothers-of-brides-to-be.

As our daughter Ann was teaching in a New Jersey school and the wedding would take place in Canandaigua, an upstate New York town, naturally most of the work fell on my shoulders. After Ann and Ed's engagement was announced, advice began pouring in from all sides, and also tales of woe from other mothers who had "been through" the experience. But I had five months in which to accomplish all that had to be done, and that gave me a comfortable feeling—for a while.

My first thought was to have the invitations printed, but I realized this could not be done until my husband and I had decided where we would hold the wedding reception. Ann

was to have a church wedding, and we finally decided to have the reception at the Granger Homestead, a beautiful, historic old house which is available in our town for large parties. We knew that our own home, though adequate for our big family of two girls and three boys, would never accommodate the number of friends and relatives we planned to invite (it is surprising how large the list gets to be, once you start making it).

With this decision made, I was able to order the invitations. I had thought we would have to get engraved ones, but I found that there is a new kind called "process printed" which gives the same effect and cuts the cost by at least \$27.00. Our local stationery store had samples of all kinds of invitations, so it was easy to decide on style, wording, etc. We ordered 200, and they arrived in ten days.

## The Hardest Task

The addressing of all those invitations was the most trying thing I had to do. It involved endless searching through telephone directories, writing to relatives for addresses of friends and more relatives — always adding names, and finally ordering 50 more invitations. Fortunately, I had begun early enough so that there was time to get them printed and addressed, and to mail all of them at the customary time—three weeks before the wedding.

One thing I overlooked in ordering the invitations was to have "R.S.V.P." put on them, but fortunately people replied anyway, so we knew approximately how many to expect at the wedding reception.

My next big problem was what Ann's attendants would wear. She had decided to have three bridesmaids and a maid of honor, her sister Jean. Four times at an early morning hour I boarded a bus for a nearby city and spent the whole day buying, exchanging, seeking advice from bridal bureaus in stores (these were very helpful), looking through pattern books, etc. I finally decided the dresses would be white organdy over pastel shades of taffeta—pink, blue, yellow, and orchid.

As I was well acquainted with all the girls, I ordered patterns and bought all the material without taking measurements—30 yards of white organdy, and

3 yards of taffeta for each slip. Six weeks later, my friend and neighbor Grace, who made all the bridesmaids' dresses (as well as my dress for the wedding), found that she would need one more yard of the orchid taffeta. My heart sank, but luck was with me and I was able to find it.

## Hats, Mitts and Flowers

I also found just what I wanted in hats for the bridesmaids—small, white, close-fitting ones, so pretty with the new short hair and priced at only \$1.95 each. Then I bought white mitts at \$1.65 a pair. Each girl's outfit, when completed, cost her just \$26.60. I did not have to struggle with the problem of clothes for the bride, as Ann bought her wedding gown and veil, going-away suit, hat, shoes, and accessories before coming home for the wedding.

The clothes for the men in the bridal party proved no problem. It was decided they would wear white linen coats and dark trousers, and those who didn't own them were able to rent them for the occasion from a local clothing store for \$6.00.

Six weeks before the wedding I gave samples of taffeta to a florist and told him I wanted colonial bouquets for the bridesmaids. The flowers which the groom pays for—corsages for the two mothers, and a carnation for each of the men in the bridal party — were ordered at the same time. I didn't order a bouquet for the bride, as Ann was to carry her prayer book, covered with white satin, but the florist reminded me that she would have to have a bouquet to throw to her bridesmaids, so that was added to the list, too.

## Opening the Gifts

Ten days before the wedding, Ann arrived. Gifts had been pouring in for the past week, and her excitement and pleasure in opening the packages knew no bounds. But she was careful to number each one immediately and make a record of it in her "bride's book," which had been given to me for her by the department store where I bought the bridesmaids' outfits. Many department stores provide these books free, and also the numbered stickers for labeling gifts.

Then came the last hectic week. It was a mixture of shower parties, an unending stream of gifts arriving; the checking of acceptances and regrets for the reception; hurried meals, and with all this the constant fear that

A cup of coffee for the bride and groom is poured by one of the many friends who helped to serve the wedding reception refreshments.

The last picture taken by the photographer was this one of the bride and groom smiling a happy goodbye as they drove away to start their new life together.

—Photos by James Parks

some important detail would be forgotten.

On the day before the wedding, the big job of decorating the church, our home, and the Granger Homestead was taken over by my friend Ruth, and I feel I can never repay her for what she did for me, not only in the saving of expense, but in releasing me from a great deal of responsibility. Early that morning she and I drove to the country to buy flowers, and we returned at noon with the car full of them. They cost just \$8.00, and we had more than enough. To keep them fresh, we set them in tubs of water on the back porch, and even filled the bathtub (making it necessary for anyone who wanted to take a bath that day to go across the street to a friend's home!). Ruth worked all the rest of the day until midnight, making flower arrangements that were lovely beyond words. Other friends came that night to help her.

The wedding rehearsal was set for seven o'clock that evening, and was followed by a wonderful supper given by our friends Mary and Earl, and Betty and Cy, who live across the street from us. Good friends are always a

help, but never more than when there's a wedding in the family! Looking back, I can see that it would have been easier for our hosts if we had planned to have the supper before the rehearsal, as we were late in getting back. One of the ushers from out of town was delayed in arriving, and that held us up. I'm told this often happens.

The wedding day dawned—a beautiful July day—and everything went like clockwork. When the wedding ceremony was over, Ann and her husband, Ed, held a gay, impromptu reception on the steps of the church, and then followed the reception at the Granger Homestead. I had planned the refreshments for it a long time in advance and

(Continued on Opposite Page)

# Wedding in the Family

(Continued from Opposite Page)

engaged someone to prepare them — dainty sandwiches (turkey and ham), relishes, wedding cake, coffee, and a delicious frothy, pale green punch called "June Ice." It was a mixture of ginger ale, lime ice, and lemon juice, mixed just 15 to 20 minutes before serving, in these proportions:

## JUNE ICE

1 quart ginger ale  
1 quart lime ice  
1/3 cup lemon juice

Ann's friends helped to serve the 165 guests. The lime punch was served during the first part of the reception while we were receiving guests, and then later everyone found their way to the dining room where the bride's cake was cut and the other refreshments served.

One person who was constantly with us that day was the photographer, for Ann, like many other girls, wanted to have a "picture story" of her wedding. He made no charge except for the pictures which he sold later to those who wanted them. For these, he charged \$2 apiece for the ones bought by the bride and groom, and \$1 each for ad-

ditional ones sold. Ann and her husband have theirs in book form, and have only to turn the pages to bring back lovely memories. Everything is there from Ann's arrival at the church for the wedding ceremony to the moment when she and Ed waved a happy goodbye and drove away to commence their new life together.

When the big day was over, my husband and I had one more hard job—the packing of the gifts for shipment to Ann's new home. It was no small task, but we eventually finished it and our home once more resumed its normal appearance.

I would now feel that the biggest job of my life was behind me it it weren't that our second daughter, Jean, has just announced her engagement! Her wedding date has been set for two months from now. As she is teaching in a distant city, and won't be home until two weeks before her wedding, I shall again have to make all the arrangements—but it won't be so difficult this time. I feel like an old hand at it now, and the reward is that we will have two more sons.

## Cool, Crisp Cottons

No. 2358. A dress created solely to flatter and fit the half-size figure! Clever bodice tucks, gentle seven-gore skirt. Easy to make. Sizes 14½, 16½, 18½, 22½, 24½. Size 18½, 3¾ yds. 35-in.

No. 2363. The heart-shaped bodice of this pert pinafore is topped by gathered straps . . . just enough to shadow the shoulders! Sizes 12-20, 36-44. Size 18, 4½ yds. 35-in.

No. 2401. A simple puffed-sleeve frock enlivened by the addition of a festive ruffle outlining the neck and edging the skirt. Sizes 2-8. Size 4, 2½ yds. 35-in.; pantie (included), ¾ yd. 35-in. fabric.

No. 2437. A scalloped scoop—thanks

to the neckline which buttons atop the shoulders, the shaped belt and pretty bolero. Sizes 10-20. Size 16 dress, 3¾ yds. 35-in.; bolero, 1½ yds. 35-in.

No. 2334. One of the best of all budget-savers is the double duty idea. Here it is in a back interest sundress and covering bolero that looks good in many fabrics. Sizes 9-17. Size 13, 5¼ yds. 35-in. fabric.

TO ORDER: Write name, address, pattern size and number clearly. Enclose 25 cents for each pattern wanted. Add 25 cents for our new Spring-Summer Fashion Book which has stunning pattern designs for all ages, sizes, and occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

## "The Face Is Familiar..."

Producers of fresh fruits and vegetables, like the producers of practically everything else, are being called on for increased supplies.

This same thing happened during the last war, and growers and distributors delivered the goods. As a result, the produce industry earned and has held a position of greater importance in the national food picture.

So two long-range objectives—financial soundness for the industry and improved service to consumers—were furthered.

It looks like the same thing is beginning to happen all over again.

Once again the produce industry is faced with the responsibility of improving its performance.

Once again the produce industry is offered the opportunity of improving its position.

This situation calls for practical application of the very same principles progressive groups have been emphasizing for years. These fundamental principles are not revolutionary, or even new. But they are essential to the successful completion of the job at hand:

1. The production of varieties most useful in meeting the nation's food needs.
2. Increased efficiency in every phase of production, grading and packing.
3. Constant efforts by growers and distributors to eliminate damage, waste and spoilage.
4. Constant efforts by growers and distributors to get produce to the consumer at the peak of its quality and freshness.
5. Constant efforts to improve the distribution process by shortening the route, reducing handling and speeding movement.
6. More effective advertising and promotion of produce to create more uses and greater demand.

In other words, the situation calls for constant, cooperative efforts involving every segment of the industry, and covering every step from the beginning of production to the consumer's market basket.

The "face" of this program is certainly familiar. But we of the Atlantic Commission Company sincerely believe such a program will best enable the produce industry to meet its new responsibilities and promote its future well-being.

# How to Paint a Chair

By DOROTHY WELTY THOMAS

**I**F YOU ARE itching to paint the porch furniture or the kitchen chairs, the first thing to do is to provide yourself with a *good* brush. A small varnish brush of a quality that will not shed its hairs while you are painting is best. It should be about an inch and a half wide. Of course a little brush for rungs and a larger brush for back and seat of a large lawn chair are better.

If the brush is old and stiff with dried paint, you may clean it by boiling it in vinegar or applying one of several commercial paint removers. If it is not too bad, rub lard into it, let it stand over night, and wash in turpentine or kerosene.

Outdoor furniture requires outside paint. Indoor chairs may be painted with enamel or inside flat wall paint, or almost any kind you want to use. Enamel washes best. New paint should be well stirred and, if properly mixed, usually is the right consistency as it is taken from the can. Old left-overs will need to have the "skin" removed, be strained through a wire strainer, and thinned with turpentine.

The consistency of the paint should permit easy spreading with the brush, and should not be thin enough to run and drip off the sides of a surface. It should also cover as well as possible. Turpentine evaporates quickly on a warm, dry day and paint will need to be rethinned after a few hours.

Spread a drop cloth or papers under your chair, and sand its surface with

No. 1 or No. 2 sandpaper. Rough places should be dressed down, and a glossy surface roughened so that the paint will cling to it.

Turn the chair upside down and paint the inside and under surfaces first. This enables you to reach the remote spots without getting more paint on yourself than on the chair! You do not need to paint the bottom of the seat.

Two coats of outside paint on outdoor furniture are usually necessary, and make sure that the first coat is really dry before applying the second. Enamel needs to be preceded by flat white or undercoater; the latter gives greater coverage. A very fine job requires several thin coats, sanding with very fine sandpaper between each coat. The undercoat should be built up until the surface is of even color, and the enamel applied last. Brush the paint first this way and that, until the brush strokes are no longer noticeable. You will appreciate a fine brush when doing rungs.

Let the job dry where there is no chance of dust or leaves falling on it. Decalcomanias may be applied after the last coat is finished. Striping, to be well done, requires a special striping brush with extra long, limber hairs and is difficult for a beginner.

Black paint or very dark colors should be preceded with flat color of the same. Light colors can be underpainted with tints rather than the exact shade of the finishing coat.

## A Luscious Lemon Pie

By ANNA R. WILLMAN

"A THING of beauty is a joy forever," says the poet, and to my mind nothing is more beautiful or tempting than a delectable lemon pie, its flaky crust and lemon-colored filling topped with a snowy meringue. Here is my favorite recipe for the filling and meringue. Use your own pie-crust recipe:

### LEMON PIE

1½ cups sugar  
¼ cup cornstarch  
¼ teaspoon salt  
1½ cups boiling water  
1 tablespoon grated lemon rind  
2 egg yolks, slightly beaten  
¼ cup lemon juice  
1 tablespoon butter

Blend together the sugar, cornstarch and salt. Add the water gradually, stirring until well combined. Add the lemon rind. Cook over direct heat until the mixture thickens, stirring constantly. Place over water in a double boiler and cook for 15 minutes, stirring occasionally. Pour slowly over the egg yolks, stirring until well combined; return to double boiler and cook for 2 minutes. Remove from heat and add the lemon juice and butter. Cool. Pour into a baked pie shell; cover with meringue, and bake in a hot oven, 425° F., for 4 minutes.

### MERINGUE

3 egg whites  
¼ teaspoon salt  
6 tablespoons sugar

Beat the egg whites and salt until frothy. Gradually beat in the sugar, sprinkling a little at a time over the surface of the egg whites. Continue beating until the mixture will stand in peaks and is very smooth and glossy.

—A.A.—

## PRIZES FOR ONE-ACT PLAYS

**I**F YOU can write a good one-act play (or a longer one), you still have time to enter a contest which is offering a first prize of \$100 and two honorary mentions of \$25.00 each. The contest ends this month—May 31—and the plays will be judged during the sum-

mer. Manuscripts should be sent to Professor A. M. Drummond, Goldwin Smith Hall 127, Cornell University, Ithaca, N. Y.

Both serious and comic plays are eligible, particularly plays with a country life flavor, such as the AMERICAN AGRICULTURIST one-act plays and the New York State Plays Project plays. A list of these plays, with a brief description of them, may be obtained by writing to Play Department, AMERICAN AGRICULTURIST, Box 367, Ithaca, N. Y., and enclosing a 3c stamp. You will surely want this list if you are interested in putting on a play in your community. All plays on our list are 35c a copy, easy to produce, and royalty free to amateur groups.

—A.A.—

## BOTTLES MAKE NICE CONTAINERS

Save all the small bottles that come your way. They make excellent containers for the sewing basket. The small, round bottles are the best, but of course others may be used. They are just the thing to keep those hooks and eyes, snaps, needles, pins, buttons and other small sewing aids. Kept in bottles this way, you can see at a glance what you have and won't have to rifle through the sewing basket every time you want anything. This helps to keep your sewing basket always tidy.—B. C.

## SEA CHANGE

By Mildred Goff

The ocean is demure and innocent today,  
A Quaker maiden dressed in pewter gray.

She is not always thus; for she may choose  
To wear bright emerald greens or muted blues,

Or misty lavenders. And I have seen  
Her walk in moonlight, jeweled like a queen.

And once I saw her, shrieking with despair,  
In purple rags, with seaweed in her hair.

## Franklin, N. Y., Has Oldest Reading Circle

**M**ANY things have changed in this busy modern world, but not our Washington Reading Circle of Franklin, N. Y., a typical rural town located in the foothills of the Catskills. It's the oldest reading club in the United States, having grown out of a Washington's Birthday get-together of five Franklin ladies back in 1887. The dues are still 50 cents a year; the present-day club members still meet every Monday night to be read aloud to (half hour of non-fiction, a half hour's discussion of current events, and a half hour of fiction); we still have an an-

nual Washington's Birthday party, to which our husbands are invited.

Besides keeping up on new books and current events while we lean back comfortably and knit or sew, we find it restful to belong to at least one organization which has no cause to support or dinner to put on. We can enjoy each other's company without feeling that by the next meeting some definite goal must be achieved.

In the above picture are 23 of our 30 members. First row (seated on floor), left to right: Mrs. Robert Bartlett, Mrs. Paul Maurer, Mrs. Sinclair

Ward, Mrs. Donald Law, Mrs. Douglas Matteson. Second row: Mrs. Ruth Slawson, president (seated on arm of day-enport); Mrs. Duane Wheat, Mrs. Charles Berray, Mrs. John Fagan, Mrs. Stacey Belden, Mrs. George Martin, Mrs. Howard D. White. Last row, standing: Mrs. Paul Whigham, Miss Leora Lucas, Mrs. William Ward, Mrs. Kenneth Simmons, Miss Edith Miller, Mrs. Charles Stinard, Mrs. George Rich, Mrs. Walter Stilson, Mrs. Lawrence Bennett, Mrs. Eva Boggs (sec.-treas.), Mrs. Kenneth Bennett (1st vice-pres.).

—Agnes A. Ward

## Today in Aunt Janet's Garden

### Know Your Seeds

**O**LD hands at growing flowers from seeds know that it saves trouble if those of similar germinating periods are planted in the same boxes, pots or flats. I learned that fact the hard way — that fast-growing kinds overshadow the slower ones and that hurried transplanting of the former disturbs the tiny rootlets of the latter, with benefit to neither! Sometimes instructions on the packet are quite clear as to how long it takes to sprout, but it helps in planning if you know this before ordering.

Here is a list of the commoner flowers, with germination periods; it is a list not easy to find and therefore one to keep for ready reference:

### 5-Day Group

In the 5-day germination group are ageratum, amaranthus (a colorful foliage plant), anthemis (yellow marguerite), candy tuft, cardinal climber, centaurea (bachelor's button), clarkia, calliopsis, cosmos, annual forget-me-not, dahlia, annual pink, strawflower, marigold, mignonette, four-o'clock, and zinnia.

If the quick-germinator happens to have large seeds and colorful flowers, its popularity is much greater than the slow-germinator with small seeds. Marigolds and zinnias are the best examples of this group. Besides starting easily in flats they also lend themselves readily to growing in rows in the vege-

table garden, to be transplanted wherever desired or just thinned and left in rows for cutting. Incidentally, careful spacing of seeds at planting time makes the thinning job easier. With the great variety of height and color available in these two flowers, practically every purpose of garden and house decoration could be served.

### 10-Day Group

But summer without the petunia would lose much of its glory, it seems to me. Yet the petunia belongs in the group having very tiny seeds which take from 10 to 20 days to sprout. It really should be started in a flat, to prevent losing the seed in the garden, from washing up or from just losing track of them. If for any reason they can't be started in flats, they will grow in the garden but bloom later. And please get rid of seedlings from last year's petunias; I was weak-kneed enough to leave some in my border because the originals had been good hybrids, but I must say that their children did them no credit!

Other seeds requiring 10 days to sprout are acroclium (everlasting), pimpernell, anchusa, snapdragon, aster, balsam, calendula, carnation, cerastium (snow-in-summer), cleome (spider-plant), California poppy, baby's-breath, lobelia, lupin, nigella (love-in-a-mist), pansy, poppy, portulaca, scabiosa, tithonia.

### 15-20 Days

Those taking 15 to 20 days to show growth are begonia, datura (angel's trumpet), annual larkspur, godetia, impatiens. (balsam), kochia (standing cypress), primula, salvia, salpiglossis and sweet peas. Poppies, portulaca, larkspur and salpiglossis do not like being transplanted; hence are better if sown where they are to remain.

One of the chief difficulties in growing these slow sprouters in the garden is the crusting over of the soil. A good way to provide the porous soil needed for easy sprouting is to mix the fine crumbly soil from the compost pile or pit with sand, half and half, and cover the seed with this mixture. The seed should have an easy time breaking through if you make a shallow trench with the end of the hoe handle (as I do), space the seed in the trench, then fill the trench with the porous mixture and pat it down with the back of the hoe. This soil mixture because of the humus content helps to hold moisture right where it will be needed.

If you do not have a compost pile or pit already started, I hope you will start it this season, with lawn clippings, vegetable refuse and similar material that will break down readily. It is a wonderful help when it comes to planting seeds, top-dressing borders, or potting house plants.

## Please Tell Me...

By Kathleen Berresford, Nutritionist

**Why do government charts recommend that everyone eat a yellow or green vegetable every day?**

Yellow and green vegetables are high in vitamin A. We need this vitamin to keep our skin and hair in good condition, to keep up the body's resistance to disease, and to prevent "night blindness." Such vegetables are carrots, rutabaga, sweet potato, winter squash, green leafy vegetables, and broccoli; also, tomatoes, even though they are neither yellow nor green! The green leafy vegetables are good sources of minerals as well as of vitamin A.

## KIDNEYS MUST REMOVE EXCESS WASTE

When kidney function slows down, many folks complain of nagging backache, loss of pep and energy, headaches and dizziness. Don't suffer longer with these discomforts if reduced kidney function is getting you down—due to such common causes as stress and strain, over-exertion or exposure to cold. Minor bladder irritations due to cold or wrong diet may cause getting up nights or frequent passages.

Don't neglect your kidneys if these conditions bother you. Try Doan's Pills—a mild diuretic. Used successfully by millions for over 50 years. While often otherwise caused, it's amazing how many times Doan's give happy relief from these discomforts—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

## WHAT'S GONE BEFORE

Immediately after his marriage to Ann Clinton, Mark Wilson leaves to join Lincoln's volunteers. His brother Charlie and his father, George Wilson, following him into the Army; also, Ann's father, Fred Clinton. When Mark becomes involved with the entry into the Union lines of a Southern spy, his mother and Ann journey to Washington to see President Lincoln. They obtain a pardon, and have a glad reunion there with their men. Because the Army bands of which the Wilsons are members are being disbanded, the boys announce they will soon be discharged, but that they plan to re-enlist. On Nancy's and Ann's return home, Ann finds her Mother in a bitter mood, apparently resenting what she calls Mark's "disgrace."

## CHAPTER XVIII

NEXT morning when Ann saw Enoch come up the road and stop off at the barn to do the chores, she went down to assure him that she could manage the chores now and to thank him for what he had done while she was gone. She resolved to ask him about what her mother had said, but it wasn't necessary. Grinning a little after greeting her, he said:

"Who d'you suppose did the chores one night?"

"I know," Ann answered, unsmilingly. "Mother told me that Henry Bain did them."

Still grinning, Enoch asked:

"Did she also tell you why I didn't get back to do 'em?"

That question was embarrassing. After all, she loved Enoch and didn't want to hurt his feelings, so her answer was vague:

"W-well—she was just repeating gossip, I expect."

"You needn't be afraid to talk, Ann. I know what Bain's tellin' around—and I know why."

"Do you want to tell me about it, Enoch?"

"Of course, I'll tell you. I have a brother over to Ithaey and I heard he was sick. So I fixed things up here an' went over to the Wilson place so's there wouldn't be any heavy chores, just a little feedin' to do for the stock night an' mornin' an' a couple of eows to milk, an' arranged for young Tom to do the chores. Then I got up early in the mornin', fore daylight, hired a good road horse over to the liv'ry stable, an' drove to Ithaey. I put up my horse in one of the liv'ry stables there. Glad to say I found my brother gettin' along all right. He'd been pretty sick but was most well again. Had a grand visit with him an' Lena, his wife, an' stayed all night."

"By the way, this'll interest you, Ann. While we were visitin', my brother said that there had been a well-dressed feller from these parts shootin' off his mouth a lot against Lincoln an' the war, an' tellin' some of the young fellers left around there that they should organize. He couldn't remember the feller's name at first, but after scratchin' his head for a while he got out that the name was Bain an' that we'd better keep him home for he was a Copperhead an' a trouble-maker."

"Then my brother got to frettin' 'bout the war, 'specially 'bout the Copperheads. Said all the good young fellers had gone, leavin' a lot of trash behind, who did nothin' but loaf an' com-

plain 'bout Abe Lincoln an' the war. Those who did work were busy with schemes to get rich at the expense of their neighbors an' their country."

"I told him to never mind, the war would be over after a while an' then we'd take care of the Copperheads."

"Yes, yes," said Ann, impatiently. "But what happened to keep you from getting back?"

Like the Wilson boys, Ann sometimes got a little annoyed at Enoch's garrulousness and his habit of stringing out a story before he got to the point.

"Just hold your horses, Ann, an' I'll tell you. Bright an' early the next mornin' I went over to the liv'ry stable to get my horse. Ever been in one of them big liv'ry stables, Ann?"

Ann admitted that she had never seen any bigger than the one in Owego.

"Well, this 'un had a little room up front where I went to settle for keepin' the horse. Even that early in the mornin' there was a gang of loafers in there. The room was hot an' filled with tobacco smoke so thick you could cut it, an' it stunk to high heaven of blankets an' harness an' horses. The gang was playin' poker. They were all young fellows, just war age. I still had in mind what my brother had been sayin' about Copperheads, an' when I heard those fellows say somethin' about 'that dirty old backwoodsman, Abe Lincoln, ruinin' the country', I lost my head an' called 'em danged Copperheads an' waded into 'em. There's no question but my brother's right, Ann. The soldiers an' the Union have got enemies back of them as well as in front of them!"

"But what about the fight?" asked

Ann, eagerly. "Did you win? Tell me the rest of it."

"Isn't much more to tell," said Enoch, caressing a large black and blue spot that still adorned his forehead. "As I said, we got into a fight. Four to one makes the odds just a leetle too much. I got licked, good and proper—and that's why I wasn't in shape to do the chores that night, Henry Bain's lies to the contrary."

Enoch paused, and then added with a sly chuckle:

"Yep, I got a liekin'—but them fellers knew they'd been in a fight, too!"

The three Wilson boys, with the help of Enoch Payne, were husking corn in a field on the Clinton farm, a day or two after the boys got home. It was a late October day, and the bright sun was warm and relaxing as they sat on piles of husked stalks. They were quietly intent on their task, and all that was heard for a long time was the rattle of the dry corn as they tipped over a standing shoe, husked the bright Indian corn ears, and threw them into nearby crates.

Mark had been unusually quiet that morning, and after a time he got up to stretch his legs, cramped from his position, and stood looking at the sheoks of corn standing in orderly rows like the tents of a well-organized military camp. Suddenly he turned around to Enoch and said:

"Enoch, tell me, what are the neighbors around here saying about the trouble I had in the army?"

Taken unawares, Enoch hesitated and looked embarrassed.

"Shucks! Nothin' much. Nothin' that's important."

"Tell me the truth," Mark persisted. "I want to know."

The cornstalks fell from Enoch's lap as he also stood up, a little helpless and at a loss for words.

"That's nothin' to worry about, Mark," he said, finally. "You grew up in this neighborhood and your friends know everything is all right." Then, honestly, he added:

"Course everybody has enemies, particularly in times like these, and everybody is terribly worried about the war. There's them, too, that would like to get people off from their own necks by drawing attention to somebody else."

"I know who you mean," said Mark, bitterly. "It's Henry Bain that's doing most of the talking, isn't it?"

Enoch answered that question only indirectly:

"Hank himself is taking a lot of criticism. He's stayin' home an' gettin' rich on war prices, an' on the troubles of his neighbors. I think he's stirring up the Copperheads, too. There's them as says he ought to be tarred and feathered an' rid out of town on a rail."

Tom jumped to his feet.

"Well, then, by gosh, let's do it," he cried.

The tension was broken as everybody laughed, and one by one they resumed the job of husking. But Mark still had the subject on his mind and after a while he said:

"Enoch, you know that Charlie and I are going back, and that ought to be the answer to any of my friends about my real feeling about this war."

"Of course it is," agreed Enoch. "When are you plannin' to leave?"

"Pretty soon. With good weather we ought to get this corn husking job done and the corn in the crib and the stalks in the barn in a day or two. Then we'll be moving on."

Again Enoch looked embarrassed.

"Well, Mark, don't want to worry you, but there is one thing some of us are thinkin' about, and that's about this Clinton farm. We know that Bain has the mortgage an' that you and Ann and her mother can do nothin' now about meetin' the payments—and Bain's a skunk."

"I know how it is, Enoch, but there's nothing I can do about it," said Mark. "Farm or no farm, I have felt from the beginning that my first job is the war. Also, the land on this farm is poor, the buildings need repair, and I think when I get back I'd rather start anew on a better place than have anything to do with Bain."

"The more I think of it," he mused, "the more I think it would be a good idea to let Bain take the farm. It isn't much good, anyway; isn't worth much more than the mortgage. It would be just as easy to start over again."

That night at the Clinton supper table Mark at last brought up the subject of his return to the Army.

"Now that the fall work is done, Ann, and you and my mother won't have to work so hard, Charlie and I think we ought to leave soon. Charlie's going into the cavalry, and I'm going back to the regiment I enlisted with before."

Both Ann and her mother stopped eating, and Mrs. Clinton exclaimed:

"There's no need of your going now. There won't be any fighting until spring. No need of your going anyway that I can see. You might give some consideration to Ann and me. If anyone must go traipsing off, let the unmarried fellows go."

Mark caught a pleading look from Ann and choked back his rising anger.

"We all have our own ideas of duty," he answered. "I know it's hard on you folks to stay here alone; it's hard on me to be away from you, too. But you both know how I feel. As much as I love Ann, and as hard as it is to be separated, I never would be happy staying here while so many others who have just as much to lose are down there fighting."

But that didn't satisfy Mrs. Clinton: "I should certainly think," she said, disagreeably, "that after the mess you got in, you'd have your fill of it."

Mark jumped up from the table, pushing his chair back so violently that it fell over, and went out to the barn without even stopping to put on his cap. There Ann found him a few minutes later, sitting on a potato crate, his head in his hands. She stood close to him, looking down at the dejected figure, her hand on his shoulder.

"I'm sorry, Mark. Mother shouldn't have said what she did. But she's so

## NO DRUMS

(Continued from Opposite Page)

worried about losing this farm."

"Well, I had a plan about the farm that I wanted to talk over with you and your mother, but I never even got a chance."

"No," she answered, gently, "but you can tell me." Pulling up another crate she sat down beside him.

"The farm's not much good, Ann, you know that. I've been thinking we'd be better off to rent a different place until we could save enough money maybe to buy it. What do you say we let Bain take this farm?"

Ann didn't answer for a moment, but finally said, gently:

"That would be all right so far as we are concerned, but what about Mother and Father?"

"What do you mean?"

"Well, Pa went to war, and your father writes that he's doing well—you know what I mean, not drinking. Don't you think he wants something to come back to, if he comes back?"

"Yes, you're right," Mark agreed.

"But it wouldn't take much to be just as good as this farm."

"You forget something, dear. Maybe the farm isn't much good, but to father, and especially to mother, it's home. Everything about it means something to them: that big lilac bush on the side of the front porch that Mother planted with her own hands; the old orchard with its blossoms in the springtime and its fruit in the fall; even the path that winds its crooked way from the house to the barn that we've all trod so many dozens of times a day. My dear, you know that's why so many farmers stay on these poor farms. There are some values not measured in dollars. Ever since I can remember, we've all sat on that front porch in spring, summer and fall and looked down beyond the cow lane that leads between the two stony meadows to the pasture on the other side of the brook. At the top of the pasture we can see, just as you can from your home, the woods—blossoming out in a million shades of green in the spring, turning so many brilliant colors in the fall. Mother and Father are getting old; no other place would seem like home to them now. It would break Mother's heart to have to leave it. I'm sure that's why she's so nervous and upset and says things she doesn't mean."

But Mark was not to be diverted from his own idea.

"I like all of those things about the place just as well as you and your folks do. You know that. But you know that you and I have to make a living. We can't eat fine views and beautiful woods. We've got to be practical."

"And while we're talking, Ann, there's something else that bothers me. Two or three times lately your Mother has said something about Henry Bain, what a kind, fine man he is, and so forth. Well, he isn't. He's a rascal, and some of the things he is saying around the neighborhood are almost treasonable. Moreover, he's the one that has had the most to say about the trouble I had in the Army. I can't think how your mother can be talking about him so much unless she sees him often. And that means that he must be coming to the house when I'm not here."

"He is," admitted Ann. "But I don't like it and I've told Mother so. She's nice to him for the very reason I just told you, that she can't bear to think of losing this farm, and she thinks that if she's kind to Henry and treats him well, he won't foreclose the mortgage."

Mary stood up.

"Stuff and nonsense!" he exclaimed. "Bain's got just two ideas in life: one is to make money—and it doesn't matter how he does it—and the other's you. That's why he never misses an opportunity to lie about me. That's why he comes here when I'm gone."

## ALONG THE OLD CANAL

By Inez George Gridley

Down the old towpath trail to yesterday  
Cattails and purple loosestrife are content  
To root where restless water tugged and  
swelled;

And here and there a sturdy tree has lent  
Some credence to the slow receding years.  
Boat men are gone. The slow old times  
are dead.

The children playing on the crumbling  
locks

Look up at progress winging overhead.

Ann stood up to face him.

"Well," she cried, "all that you say about Henry Bain may be true, but what can I do? I don't like his coming here, and I certainly have given him no encouragement. I've tried to get Mother to discourage him, but I'm caught, Mark, I'm caught. Mother's right. If we make Henry Bain mad, we'll lose our home. Maybe you and I could make out better somewhere else, as you say, but you wouldn't want to have father and mother live with us, and what would they do?"

Mark stood looking at his wife. All of the months of loneliness since he had gone to war, the worry and despair over his trouble with the military authorities, the gossip and criticism of some of his neighbors were foremost in his mind as he answered her question.

"Do?" he cried. "I'm beginning to wonder how much you care for me. You know I would always do everything I could to take care of your father and mother, but did you ever stop to think that they've had their chance to live, and we haven't? I'm telling you plainly, it doesn't set well with me for you to stand there and practically tell me that Henry Bain, my bitter enemy, and our country's enemy, can come here when I am absent, when you and I know, and the whole neighborhood knows, that he is scheming all of the time, hoping against hope that something will happen to me so that he can get you."

Ann looked up at him with stricken eyes, her face white as a sheet.

"You forget something, Mark. It's you that I love."

Then she turned and left the barn. For a long time Mark sat on the potato crate, his head in his hands, his mind a chaos of conflicting and bitter thoughts. Then, forgetting the chores, he got up slowly like an old man and went down the road to his old home without a backward glance. The next morning the stage coach carried him to Owego on his way back to the Army.

(To be continued)

**INDIVIDUAL, competitive enterprise is the key to all other freedoms. Our freedom of economic opportunity is as basic as our freedom of the press and our freedom of worship in accordance with our beliefs. We founded this country on the philosophy of very little power at the top. We sought instead to encourage individual men, each to build for himself and so create wealth.**

"The economics of individuals is not something that can ever be blueprinted from the top. Such a philosophy is a reactionary doctrine; an evil unchristian philosophy, denying the individual his basic human dignities. The problem of meeting this destructive philosophy is a moral problem and an economic problem in one."

—PAUL GARRETT, Vice-President  
General Motors Corporation

Timberib dairy barn, 40'x120', on the farm of Alex Naegli, Vancouver, Washington. Capacity 40 cows, 240 tons baled hay.

## Low Cost, Durable . . . with Open Floor and Storage Space

You get more barn and a better barn for your money with the Timberib. Here are some of the reasons why—

4 times as strong as nailed rafters.

Erected faster, because rafters are in one continuous piece, ready to use without cutting, fitting, waste.

Unobstructed mow space, with no inside posts, braces or supports of any kind.

Timberib barns are made in widths from 12' to 75', in any desired length. Also available for making long lasting, low cost sheds, poultry houses, granaries, and utility buildings. Fill in and mail the coupon now, and without obligation we will send you descriptive literature and full information.

## AT HAYFIELDS

By TOM MILLIMAN

### GRASS SILAGE — FIFTEENTH YEAR.

**A**T THIS WRITING, April 17, 1951, plowing has been done at Hayfields, and it rained again last night. But in every year there is a seed time and a harvest. We merely get off to a later than usual start. Luck, at least a little of it, must walk with us in late April and throughout May if we are to get all the spring work done and grass silage started in early June. Without an early June start at this farm, 15 miles southwest of downtown Rochester, with an elevation of 600 ft. above sea level, we shall not be able to finish our three silos before June 20. The third silo is yet to be erected, although all of the parts for it have been delivered. One of the extra spring jobs for the farm crew is to dig the trench for the silo foundation.

Why be in such a rush to put up grass silage before the regular hay season starts, when, by waiting, the spring work could be done more leisurely and the fields of mixed hay and alfalfa harvested as dry hay? We have plenty of mow space for all the hay the cattle need. Why grass silage? It is a fair question. Our own 14-year experience and much observation throughout the Northeast and mid-West lead us to these conclusions:

**1.** Spring work—that is, fencing, seeding with oats, planting corn, other planting, renovating of patches or islands of roughland pasture, and first cultivation of corn, should all be completed before June 8, at the latest, if good results are to follow. There is a time for everything, and spring itself is the best time for spring work, regardless of anything to come later. The sun waits for no man.

**2.** Taking a field of mixed hay or legumes in the early bloom grass stage and putting it in the silo is an act which captures the crop at its point of highest protein, greatest total feeding value, and best palatability. There is much more nutriment to be had from mixed hay taken early as grass silage than is available in the same field cut later and harvested for hay without rain. With rain, which can be expected to overtake at least half of the first cutting of hay, the difference in favor of grass silage is enormous.

**3.** With a field chopper, especially one such as ours without a mowing attachment, the job of harvesting as grass silage is faster, less laborious, and cheaper than to harvest the same field as hay later.

**4.** A silo will hold many more tons of grass than of corn silage. If the grass is made up of a goodly percentage of legumes, the protein content of the silage will be almost double that of corn silage. In turn, this favorable condition permits greater use of the low protein home-grown grains such as ear corn, oats and wheat, and consequently creates a reduction in the requirement of purchased feed. Real money is thereby saved. Good grass silage is high in protein, even in the early cut grasses as distinguished from the legumes.

**5.** Clearing a hayfield of its first crop by mid-June or even June 20th provides earlier, more, and better aftermath grazing or second cutting. For

this reason the practice of ensiling grass in many cases does away with the need for Sudan grass pasture.

**6.** Increased total productivity of the farm may be expected to follow the practice of ensiling grass. It comes through longer life of legumes which are not choked out by tall grasses remaining too late in the season, and comes also by the tendency to rotate more frequently by plowing up the hayfields before the legumes completely fade.

### Preservatives?

In 1937, we started with liquid phosphoric acid and continued with it until the supply was shut off by World War II. It was a success. Then for one year we were able to get molasses. After that, for a period of at least five years, we put up grass silage without any preservative at all. It was successful.

Later in the post-war period, molasses was used as it became available and moderate in price. In 1950, it was really cheap and we bought it most liberally. Now in April, 1951, we find that molasses is about three times the price we paid in June, 1950. For that reason and because of our successful five-year experience without preservatives, we shall not buy molasses for grass silage this season.

Heretofore, for grass silage we have used molasses for its feeding value and because it was a good bargain as a feed. We did not buy it because we thought we had to have it as a preservative. It was a supplement and a good one, to be combined with high protein grasses and legumes in the silo. In case molasses doesn't continue to increase in price between now and June, those farmers who are reluctant to put up grass silage without it, can still use it at a price which figures about the same as cornmeal in feeding value per dollar spent. Therefore a farmer wouldn't be paying anything for molasses as a preservative over and above its value in terms of corn.

### Wilting

We follow the wilting method and much prefer it over the system of having a machine which mows, chops, and blows into the truck all at the same time. In the latter case, harvesting is slower and there is always too much excess juice which has to be eliminated from the silo somehow, generally by leaking out through every joint and cranny into which moisture under pressure can penetrate and escape.

On the other hand, long experience has taught us to avoid over-wilting, particularly after the 15th of June. Wilt more in early June, and then gradually less. As the season advances, the days get warmer, plants decrease in moisture as maturity approaches, and the sun, the greatest evaporator, gets hotter.

Before the end of silo filling, the field chopper at Hayfields is running almost immediately behind the mower. The moisture content should of course be 65% to 70% in the chopped material. We use no moisture-determining instruments and need none. Except for straight legumes or mixtures very heavy in legumes, the old "ball-in-hand" method is a good one. It will be

recalled that the late H. E. Babcock, founder of this page and its writer for 18 years, several times suggested that a handful of grass silage be grasped and squeezed, then the fingers relaxed. If the resulting ball stays solid, the silage is too wet. But if the ball slowly expands after pressure is released, the moisture content is about right. Mr. Babcock was about right, too, when he recommended this method.

### Harvesting

Last year the field chopper picked up the green grass directly from the swath without the use of either windrower or rake. We happened to have had two exceptionally heavy yielding fields, 18 acres of which filled two silos of 14x40 and 12x40. Because the herbage clung together, the field chopper had no difficulty in completely cleaning the swath. This year on two of our fields, we are not going to be so fortunate, and will probably use the side delivery rake on one and the windrower on the other.

After long consideration, we avoided the construction or purchase of apron-type unloaders to be fixed in truck body or trailer. Instead we purchased for \$475 an installation which turns an ordinary farm truck into a hydraulic dumper. The expenditure was made not only for filling silo with grass or corn, but because the dumping feature has a dozen other uses on the farm. We even use the hydraulic lift to elevate the front end of the truck floor to encourage a balky cow or bull to step from

age is backed up to the blower and the tail gate released, by the use of the power lift and the raking action of a potato hook in the hands of one man, the five tons or more of green grass disappear into the silo in 8 to 10 minutes.

In the fall when corn is used for refilling silos, the unloading is even faster by about two minutes a load. It seems silly to use a blower smaller than the capacity of the tractor to run it and thus permit a machine costing \$300 to \$400 to cause idleness of several men and \$7,000 worth of equipment.

*Observation leads to the conclusion that undersize blowers are the chief bottleneck to modern silo filling. Moreover, the use of blowers is the most wasteful and costly means of elevating silage because a windstream is employed, in which only 3% or 4% of the power used is effective.*

*We should on fair-sized farms have an elevator suitable for baled hay, ear corn, loose grain, and for elevating grass or corn silage to the top of the silo by the use of an electric motor of not to exceed 3½ horsepower. Such an arrangement would release a tractor and save real money all around.*

### Dry Hay

Again referring to Mr. H. E. Babcock, it was only about three years ago when he asked this question of a number of farming friends, "Why hay?" None of us thought Mr. Babcock was completely against hay. The question was his method of pointing up grass silage and de-emphasizing dry hay. Mr.

Snapshot of a grass silage "burner" as she appeared on April 1, 1951, two hours before dropping her 9th calf. Although the name Isolde, 142, is assigned to her, the title "Forage Conversion Machine" would be less high-hat and more accurate. Her distinguishing feature is great appetite for pasture, grass silage, corn silage, dry hay, and even straw bedding. On February 22 last, she taped 1422 lbs. Her 8 lactations, 2X, 305, M.E., average 12,315 lbs. milk, 4.33%, 533 lbs. fat. This forage eater is now 10 years, 8 months of age, and doesn't seem to mind being a 3-breed cow.

the truck to the road bank at same level.

In installing the hydraulic lift we followed the example of good neighbors Frank and Joc Haddleton, each of whom has similar equipment. When silo filling time comes, whether for grass in June or refilling with corn in the fall, we use two trucks, our own and one of the Haddleton's. Later on we pay back by picking Haddleton corn with our mechanical picker, the only one in the neighborhood, and by earlier "changing works" of one kind or another.

### Avoid Little Blowers

In modern silo filling, with distressing frequency, the operation is hampered and delayed because the blower at the foot of the silo is too small. While making our share of other mistakes, when it came to buying a blower we picked out the biggest one we could find. It is handled easily by a three-plow tractor. Once a load of grass sil-

Babcock's "Sunnygables" was a pioneer in grass silage, starting one year ahead of Hayfields. The question is logical. One of our friends, J. Mark Robinson, of Tunkhannock, Pa., operates a large and high-producing dairy herd without any hay whatever. The sole source of winter roughage is grass silage. His cows and heifers look good and certainly do well.

*The way it looks from here is that grass silage is the No. 1 winter roughage for dairy cattle in the Northeast. The value of corn for grain in much of the Northeast is now so great and its production so successful that grass silage in releasing land for that purpose is a blessing. To fill up the space made available by the settling or feeding out of grass silage during the summer, we have only to cut, earlier, some corn which, if left, would become grain. It seems sound to believe that both dry hay and corn silage should assume places below grass silage in the roughage program. That leaves grass silage second only to good pasture in value and importance on the livestock farm.*

## Service Bureau

By H. L. COSLINE

### MINORS OWNING CARS MUST CARRY INSURANCE

Because of a steady increase in accidents involving youthful drivers, a new law goes into effect in New York State on July 1. All car owners who are under 21 years of age must carry liability insurance on their cars. This is the first compulsory automobile insurance law adopted in New York.

The new law does not prevent a minor from getting a driver's license or from driving a motor vehicle owned by someone else. However, he must carry liability insurance on his own car.

This insurance must be at least \$5,000 for injuries to one person and at least \$10,000 to cover injuries to more than one person. Property damage liability is not required under this law.

Also, there is a new law restricting the issuance of regular operators' licenses to those 17-year-olds who have completed high school or junior high driving-training courses approved by the State Education Department and the Commissioner of Motor Vehicles. Previously such licenses could be issued to 17-year-olds who had graduated from any driver-training course approved by the State Education Department.

There is no change in regulations governing junior operators' licenses to 16- and 17-year-olds.

— A. A. —

### "SO-RITE"

In the March 3 issue, we ran an item about So-Rite Fashions, 385 Gerard Ave., New York 51, N. Y. This outfit refused to accept mail from us and did not fill orders properly. We are now told that in the future complaints against them should be sent to the Chief Post Office Inspector, Post Office Department, New York City, rather than to the Federal Trade Commission as previously instructed.

— A. A. —

### "FULLER FASHIONS"

The Service Bureau has been working for some time on a complaint against Fuller Fashions of Haverhill, Mass. We are now advised that this company has been liquidated. Mr. Jack Gilbert, c/o Gilbert Shoe, Haverhill, Mass., has expressed his intention of eventually adjusting all complaints sent him. It may take some time to make final adjustments in all cases, but anyone who has a claim against Fuller Fashions should contact Mr. Gilbert.

— A. A. —

### TERMITES?

I paid \$275 to a company to treat my home for termites. The contract stated that they were to inspect the property twice annually for five years and make any further treatment necessary. The job was guaranteed for five years. After the first treatment, I have not seen or heard anything from this outfit, although it has been nearly two years!

Throughout the years, we have come across a number of cases where subscribers have been frightened into signing such contracts on being told that their houses were infested with termites. It later developed that the pests were not termites at all but powder-post beetles. Usually these outfits don't show up again after the first treatment.

If there is a suspicion of termites, it is wise to get an accurate diagnosis of the trouble from someone who knows about such things before paying money to anyone to exterminate the pests.

A miser grows rich by seeming poor; an extravagant man grows poor by seeming rich.— *William Shakespeare.*

### VERMONT MAN KILLED AT R. R. CROSSING

Unaware of the approaching south bound freight Ralph Skinner was almost across the tracks near Orleans, Vermont when the speeding train plowed into his car.

For 75 feet the train angrily shoved Skinner and his car down the tracks until it finally screamed to a halt. Skinner's twisted, disfigured body lay limp amid the wreckage.

[ Ralph Skinner's wife received over \$2000.00 from the North American Accident Insurance Co. as benefits from her husband's two low cost accident policies. ]

Mrs. Skinner wrote us a kind letter of thanks in which she said, "I am glad I kept mine and Mr. Skinner's insurance paid."

## How We Buy a GUERNSEY BULL

By  
Douglas R. Stanton

**P**RIOR to 1949, the actual procedure for selecting bulls for our artificial breeding program was as vague to me as to many of the other 30,000 dairy-men-members throughout New York State and Western Vermont. With my election to chairmanship of the Guernsey Sire Committee of the New York Artificial Breeders' Cooperative, Inc., came a realization of the amount of responsibility attached to the job.

Any one of the bulls I was to help select might ultimately sire thousands of offspring. A desirable transmitting sire was in a position to do untold good by increasing production, improving the dairy type of offspring, and producing longer-lived animals. On the other hand, an unwise selection might do the opposite.

I soon learned that certain standards, practices, and safeguards already established not only tended to prevent poor selections, but limited the use of young analyzed sires until their transmitting ability under artificial breeding conditions was thoroughly established. I also learned that plenty of help and guidance was available to every sire selection committee chairman, not only from his fellow members, but from the Animal Husbandry Extension Department at Cornell, as well. A practical background of dairy knowledge so essentially necessary to this job was provided by my experience as a 4-H dairy member, and as a dairyman with my own producing herd of Guernseys on Old Homestead Farm at Greenville, New York.

First of all, I found that sires selected for use in the NYABC Stud at Ithaca fall into one of three groups. Serving as the foundation upon which our cooperative breeding program is based are the "great herd-improving sires" which have favorable dam-daughter comparisons.

What we call "bulls-in-waiting" make up the second group. These bulls are purchased from owners who are ready to sell before proofs are

completed, and only when the committee thinks after checking the daughters' type and early production records and the pedigree of the bull itself, that the bull will turn out to be a herd-improver. NYABC "bulls-in-waiting" are used lightly until they become favorably proven, then are put into full, extensive service.

Young analyzed sires—sons of desirably proven sires from thoroughly studied cow families—form our last and smallest group. Selected because of our obligation to the dairy world to contribute to the limited supply of desirably proven dairy sires, these young fellows serve just enough animals so a proof will later become available. They then join the "bulls-in-waiting" until a proof is available on them.

Now the Animal Husbandry Extension De-

EDITOR'S NOTE— On this page Mr. Stanton, who lives at Greenville, N. Y., and is chairman of the NYABC Guernsey Sire Selection Committee, tells through personal experience what goes into the choosing of a Guernsey sire for the Artificial Breeders' Cooperative. The procedure, of course, is typical of all such Co-ops.

While the New York Artificial Breeders' Cooperative is one of the largest in the country, there are many similar cooperatives all through the Northeast. We understand that New Jersey was the first and Maine the fourth State to start such a cooperative, and that Pennsylvania has an outstanding association. Today, dairymen anywhere in the Northeast can have cattle artificially bred.

Tarbell Farms Peerless Valor 287967 is a Guernsey sire purchased by NYABC on the basis of the qualifications outlined in the accompanying story. When Valor was purchased in 1945, he had 4 daughters producing in the Thomas Munro herd at Camillus, N. Y. These animals average 7,969 pounds of milk, 5.2% test, and 414 pounds of fat, showing a good increase in production over their dams.

Valor has now been proved through artificial breeding with daughters in several different herds—the most reliable test a herd sire can be subjected to. The 34 AB daughters average 8,292 pounds of milk, 4.9% test and 416 pounds of fat. The 27 daughter-dam comparisons show a good increase in production for the daughters above their dams.

partment at Cornell plays its important part in good sire selection. When a dairyman offers a bull for sale, a member of the staff gathers all the facts he can about the animal, converts all records to a standard two-time-a-day, 305 day, mature equivalent basis, and makes at least three studies.

First, he compares all daughters and all of their dams using all of the records. Then he compares the two-year-old records of the daughters with the two-year-old records of the dams. Finally, he studies concurrent records of the daughters and dams. These last two help to detect early or late maturity, and help bring out differences in environment and management from year to year. Facts for these studies are gathered right at the farm and, while at the farm, he is constantly on the alert for information which will make our knowledge of the animal complete. Herd health and management practices, for example, are investigated as thoroughly as possible.

With these studies in hand, NYABC Manager Maurice W. Johnson and the chairman of the breed committee concerned make a personal inspection of the bull and his daughters before a decision is made about the purchase. Here are some of the points that we consider before making this decision. . .

New York State dairymen who use the NYABC service depend on their milk checks for their living. Therefore, our first consideration is the level of milk

(Continued on Page 6)

*All Set...*

# Let's Grow!

**8**—WEEK old pullets are sort of half-way between—no longer babies, but quite a way to go before the first egg. Up to now every ounce of feed has been mighty important in getting the pullet started right and keeping her healthy. Because she was such a small eater the feed had to be concentrated so that she would get all the nutrients needed for quick growth. From now on she'll eat a lot more, but her growth is slower so she doesn't need all the extras in the highly concentrated feed.

### *Everything They Need*

G.L.F. Growing Mash is made for feeding pullets after they reach eight weeks and right on through to the first egg. The vitamins, minerals and proteins so necessary for good growth and development are present in quantities that a pullet can use, and a little more for safety measure. G.L.F. Growing Mash or Growing Mash Pellets, fed with full size scratch grains furnish all the nutrients growing pullets will need.

### *Savings That Count*

Changing to G.L.F. Growing Mash will make great savings in the feed bill of pullets from eight weeks to egg laying. At present prices the saving is about \$6 on every hundred pullets. Cooperative G.L.F. Exchange, Inc., Ithaca, N. Y.

*At 8 Weeks Change to*

# G.L.F. Growing Mash

## UNICO PREMIUM TRUCK TIRES

—built especially for the kind of work a farm truck is called on to do. Wider, flatter tread means casier going over rough meadows, corn lots and dirt roads—no skidding, less jolting bumps. Shoulders reinforced for added protection against blowouts. And don't forget a Unico tube with each new tire.

## G.L.F. FLY SPRAY

G.L.F. Residual Barn Spray for the dairy contains 20% Lindane which was used so successfully last year. It is economical for barn use since one quart makes 25 gallons of spray—enough for the average barn. One quart and one pint sizes.

## G.L.F. WEED KILLERS

Chemical weed control is no longer a gamble—it is a sound and growing practice. G.L.F. Weed Killer "66" is recommended for controlling many of the weeds and grasses present in corn and grain. Check with your G.L.F. Service Agency on your particular weed problem.

## Six-Legged SABOTEURS

THE tremendous damage done by the insects illustrated on this page (and others like them) is seen more often than the insects themselves. In addition to crop failures and unmarketable crops, there is the cost of spray materials, equipment, and time required to keep them in check.

All true insects have six legs and many of them have four stages of growth—the adult, egg, larva, and pupa. Sometimes the adult does the damage, but in many cases the growing larva or worm is the villain as in the case of the Colorado potato beetle. Other insects have three growth stages—the adult, egg, and nymph as in the case of plant lice, where the nymphs do most of the damage.

Insects feed in two ways. One large group has biting mouth parts, actually eats leaves or other parts of the crop, and can be controlled by poisoning. Other insects, such as plant lice, suck juices from the plant. They cannot be poisoned but must be hit by a spray which kills when it comes in contact with them. In some cases a spray can be used which kills the eggs before they hatch.

Oh, the world's a curious compound,  
With its honey and its gall,  
With its cares and bitter crosses,  
But a good world after all.  
An' a good God must have made it  
Leastways, that is what I say  
When a hand is on my shoulder  
In a friendly sort o' way.

—James Whitcomb Riley

## TELL THIS TO YOUR CONSUMER FRIENDS

IF YOU happen to be a village or city resident who thinks farmers are getting rich, or a consumer who believes the propaganda that the farmer is to blame for high prices of food, take a look at these figures:

Charles F. Brannan, U. S. Secretary of Agriculture, says that during the first four months of 1951 the farmer averaged 69¢ an hour for his work, and 5% on the heavy investment he is now obliged to carry in his business. The average hourly wage of factory workers during the same period was \$1.56. The average hourly wage of farmers has dropped steadily since 1947, while others have risen.

James W. Dayton, Extension Service Director for the University of Massachusetts, put it in one sentence when he said:

"Rather than being overpaid, farmers are earning less for their labor, less for investment, and less for management ability than any other group."

## EAT A GOOD BREAKFAST

DO YOU often get a sort of all-gone feeling about the middle of the morning and find it difficult to finish the rest of the forenoon? If you do, maybe it is because you don't eat enough or the right kind of a breakfast.

There are thousands of people, non-farmers, who roll out of bed just in time to get to their jobs and eat little or nothing for breakfast. Health authorities are agreed that this is dangerous. They say that breakfast, following the long night fast, is the most important meal of the day; that it can vary as regards age and occupation, but in general should consist of fruit, milk, eggs and bacon, toast or rolls, with cereal and coffee if desired. The old-timers, who got into the fields sometimes at sunrise, used to have a good idea of eating a mid-morning snack.

In England, as you know, a terrible epidemic of flu has been raging, with millions sick and thousands dying every month. It is the most disastrous influenza epidemic since 1919, and would have been worse but for penicillin and the sulfa drugs. It is said that the chief reason for this widespread epidemic is the low resistance of the people, due to poor food and unbalanced meals. One report states:

"Due chiefly to socialistic schemes there has resulted 10 years of pinched eating which has so whittled away natural resistance to disease that people who would normally have lived are now dying."

We can thank God and our farmers that food is still plentiful here.

## PORTRAIT OF A FARM BOY

THE picture of the late H. E. Babcock on this page is a copy of an original painting recently dedicated and mounted in the Board of Trustees Room at Cornell University. It was painted by country artist Bob Childress, who was commissioned by Cornell Trustee Victor Emanuel to do it.

"Country boy goes to city and makes good" is an old story. H. E. Babcock never went to the city, yet his contributions to agriculture and to mankind were so great that the distinguished men who make

By E. R. Eastman

up the Cornell Board of Trustees honored Ed by making him Chairman of their Board and by this portrait.

I am proud to print this picture of Ed on this page, for, as you know, he was the founder of the page "Kernels, Screenings & Chaff." He was your friend and mine, and for a quarter of a century worked for the best interests of the readers of AMERICAN AGRICULTURIST. If you too would like to honor his memory, make a contribution—large or small according to what you can afford—to the Babcock Memorial Fund, Cornell University, Ithaca, New York. The memorial is in the form of an endowed professorship to carry on the whole broad program of better human nutrition which Ed started and promoted so well.

## MODERN EQUIPMENT DOES IT

IN THE days when all plowing was done by horses, a farmer who didn't get much of his plowing done in the fall was out of luck, and certainly would have been worried by a late spring like this one. Modern power equipment has changed this whole picture. On an automobile trip recently I really was concerned at the lack of plowing done; a little over a week later I was amazed to see how rapidly farmers had caught up.

## IT CAN HAPPEN HERE

Dr. Edward A. Rumely is executive secretary of the Committee for Constitutional Government, an organization which has worked for years to arouse the American people to the sad fact that they are rapidly losing their liberties. The Committee for Constitutional Government is supported by prominent people throughout America.

Among its activities the Committee published a book by John T. Flynn called "The Road Ahead" and distributed 750,000 full copies of the book and half a million copies of a condensation. The *Reader's Digest* also published a condensation of "The Road Ahead" and distributed more thousands of copies. For this and other similar activities, all right and legitimate, Dr. Rumely was called before a Congressional Committee investigating lobbying activities and headed by Representative Frank Buchanan.

I read the report of the investigation and the

testimony. Under Buchanan's questioning Dr. Rumely was not permitted to explain the full situation, and the whole investigation was completely unfair and un-American. Dr. Rumely gave practically all of the information asked for except that he refused to disclose the names of the bulk purchasers of Flynn's book, "The Road Ahead," and some other similar books. For this, on Buchanan's insistence, the Committee reported him for contempt of Congress, and the Congressional vote against Rumely a little later was carried by only two or three votes.

Dr. Rumely protested to the Buchanan Committee that the effort to force him to give the names of the buyers of "The Road Ahead" or of any other book was a violation of the freedom of the press as set forth in the Bill of Rights.

This case is mentioned here for two reasons: First, if a publisher can be forced by a Congressional Committee or a bureaucrat to give the names of the buyers of its books, then it is only one more easy step from there to similar charges and persecutions against magazines and newspapers. Second, Dr. Rumely was persecuted because "The Road Ahead" is hated by violent New and Fair Dealers, by other socialists and by Communists, because it shows better than any other book I have read the rapid downward drift toward socialism, communism, statism and bureaucracy in this country.

All of you have read about the case of Robert Vogeler, a young American business man who, without cause, was thrown into solitary confinement in a Communist jail in Hungary and held there for 17 months. After tremendous efforts on the part of his friends, he was released and has just returned to America. I saw and heard him on television. Although weak, emaciated, nervous and ill, and against doctor's orders, he insisted on speaking to the American people to impress on them the terrible things that are going on behind the iron curtain. Vogeler concluded his stammering, nervous talk by saying, "What happened to me can happen to you!"

Vogeler didn't mean that we are likely to undergo exactly the same experience here in America. What he did mean, and what I believe, is that unless some way, somehow we can find ways and means, and soon, to resist and stop the growing, tremendous power of bureaucrats, of little men in big places, the time is coming when the individual here will have no more rights and liberties than do the millions in Europe and Asia today.

## EASTMAN'S CHESTNUT

IN that most excellent little publication, the Ithaca Rotary Club News, the chairman of the Rotary Sick Committee yells about what a tough job he has.

First he is supposed to know who is under the weather. Then he must be very careful and find out if the member wants his ailment to be kept quiet, or if he wants the world to know that he has Galloping Dandruff. Next, should he have a few flowers, or would a card suffice, or does he want visitors? There is also another new problem which has become a habit; many fellows leave town now for an oil change, and the sick committee doesn't know if he is on vacation, or is just mad at the local doctors.

It all goes back to the two Irishmen who met on the street shortly after Pat had his operation, but nobody knew about it. So Mike said to Pat:

"Ye don't look good, Pat."

And Pat said:

"Didn't ye know I lost my appendix?"

"Well," said Mike, "it serves ye right. I told ye two years ago to put everything in your wife's name."

H. E. BABCOCK

See editorial, "Portrait of a Farm Boy."

## AA's Farmers' Dollar Guide

In the months ahead the saving of time will be more important to farmers than saving cash costs, especially those cash costs that will result in more farm production for each hour worked.

**SAVING FEED:** One way to save feed is to cut the amount given to each animal. Better ways are:

1. Cull low-producing hens and cows.
2. Improve pastures so cows and growing pullets will need less grain. (Too often, it is said, many poultrymen do an excellent job of raising chicks but neglect the growing pullets.)
3. Grow more grain where conditions are favorable.

**SAVING FERTILIZER:** Less fertilizer can be used per acre, thus cutting costs. Better ways of saving fertilizer costs are:

1. Sow top-quality seeds so fertilizer will be used efficiently.
2. Prepare the ground thoroughly.
3. Control weeds when they are young, as otherwise they will use both moisture and plant food.

**SAVING SPRAY MATERIALS:** Rather than to cut needed applications or use less than the amount needed to cover the trees, you can save by watching spray service advice. This will enable you to avoid unnecessary applications, as well as to apply those that are needed at the most effective time.

**SAVING TIME:** One of the best ways of saving time is to do jobs on time. The first step is to limit plans for production to the number of acres and animals your labor force can handle.

By keeping a watchful eye on crops and livestock you can know when a job should be done and avoid the experience of seeing that a job could have been done day before yesterday had you only seen the need at that time.

Plan each day's work. In this way you will be able to keep men and machines productively busy at reasonable speeds. This will apply equally well to your own time spent, but if there is a choice, the time you spend planning is likely to be more productive than the time you spend working.

Spend money to save time. Rearrange buildings or procedures to save steps.

Let animals harvest their own feed as much as possible. Good pastures are more economical than cutting and hauling feed to the barn.

**IRRIGATION:** Watering crops artificially often saves time already spent by insuring a crop rather than a failure.

If you already have some areas irrigated, be sure that water is applied early enough to be fully effective. If you do not have irrigation but are considering it, take time to get all the facts. Be sure you have an adequate supply of water available and study past weather records to see that crop increases are likely to be sufficient to pay for the investment.

**PACKAGES:** It looks as though packages of all sorts will be short. Don't let rats ruin burlap bags. Return them to the mill promptly. Study your probable needs for vegetables and fruit packages and get the needed supply on the farm as soon as you can. Used containers will become more important.

**MILK:** Figures supplied monthly by L. C. Cunningham of Cornell show the index of dairy costs as follows when the average of 1910-14 is 100: March this year, 322; April, 326; March last year, 293; April, 294. All dairymen know costs are going up, but this gives an accurate measure. The New Jersey Department of Agriculture shows monthly help with board and room as \$114 for April; last year, \$99; per hour, 91 cents; last year, 79 cents.

Carlton Pickett of the Massachusetts Farm Bureau Federation says the government civilian payroll increased by 2,200 persons a day for February (33,600 for the month); U. S. farm workers in February were 400,000 fewer than a year ago. —Hugh Cosline

## The Song of the Lazy Farmer

I DON'T think there's any way you could improve the month of May, at least as far as I'm concerned, each year I'm glad when it's returned. The pleasant smell of new-worked soil, the sight of folks at honest toil, the green across the country-side, the late spring sun upon my hide, the early flow'rs all blooming bright (and no mosquitoes yet in sight), the shouts of happiness and joy with which each little girl and boy greets ending of a long school year—these things all mean that summer's near.

But best of all, May means we've got a first crop from the garden plot; for me there's no red-letter day quite like the one when I can say, "Mirandy, these spring onions are the best you've ever grown by far." At gardening my wife's a whiz, I'll bet that she's the best there is; she's got the greenest thumbs around, and when she drops seed in the ground it grows so fast you have to git out of the way or you'll be hit. But

while I gobble up the stuff she grows and never get enough, I'm always puzzled by one thing, and that's how she finds time in spring to do the field work I should do and get her garden chores done too.

## Best Oil Buy For Heavy Farm Work... GULFLUBE

A Premium Quality Oil at Regular Price...

Handy 5-gallon can at no extra cost

### YOU'LL GET MAXIMUM VALUE FROM TOUGH GULFLUBE...

1. **High Stability.** Gulflube has the proper additives to provide high oxidation stability.
2. **Exacting Standards.** Gulflube is an exclusive Gulf product made to exacting high standards from paraffin base Mid-continent crude oils.
3. **Multi-Sol purified.** Gulf's Multi-Sol process purifies and stabilizes the oil.

**Tough Gulflube is your best oil buy** for heavy farm work—rugged and economical. It provides an extra margin of safety for use in internal combustion engines under your kind of operating conditions. Use Tough Gulflube to protect your farm engines, make them last longer and give better performance.

**You just can't have too many utility cans** around the farm. Buy Gulflube in the convenient 5-gallon size, and the handy 5-gallon utility can is yours at no extra cost. Can has tilted spout for easy pouring, screw caps, and wooden handle. Keep several on hand. You'll use them to carry extra gas or oil for truck or tractor, for kerosene, and literally dozens of other uses.

**Ask your Gulf man for Gulflube in the 5-gallon can** Also available in 55-gallon drums, which are an even more economical buy.

For sound farm economy, remember to ask for these GULF PRODUCTS, too...

# THE FARM BUILDING BUY OF THE YEAR!

STRAN-STEEL

## QUONSET 24 SPECIAL

This great farm building can work for you in many ways. Use it as a loafing barn for cattle—for storage of all sorts—to protect valuable trucks or farm implements. It's a real production tool.

The Quonset 24 Special is available in any length you need, in sections of 12'. Its minimum size is big enough to shelter a truck, tractor, small combine, cultivator plow and disc harrow—all at one time. No interior pillars or posts to interfere. It can be erected on raised foundations to accommodate extra-tall machinery.

For an all-round utility building that gives you year-round service, plan on adding a Quonset 24 Special to your farm this year. Get the facts from your nearby Quonset dealer right away.

### QUONSETS GIVE YOU EXTRA ADVANTAGES

Quonsets are made of N-A-X HIGH TENSILE steel, patented and produced by Great Lakes Steel Corporation. The use of this stronger, tougher steel permits simplified construction that saves you money, yet provides a structure of tremendous strength and durability. Quonsets are wind-resistant, non-combustible, rot-proof . . . completely permanent.

### QUONSET 24 SPECIAL

- Perfect Shelter for Equipment or Livestock
- Easy to Buy, Erect and Maintain

### GREAT LAKES STEEL CORPORATION

Stran-Steel Division • Ecorse, Detroit 29, Michigan

### NATIONAL STEEL CORPORATION

Use this coupon for information about Quonsets in use in *your* kind of farming. (We will include the name of your nearest Quonset dealer, from whom you can get the detailed costs.)

## "It's Handy"

### SAVING FENCE INSULATORS

Here is how I nail electric fence insulators without breaking them. Take old tractor inner tubes or rubber or leather belting and cut it up into pieces about one inch square and drive a nail through each piece. This makes a soft

taping your fishing license inside your tackle box, for patching screens or mosquito nettings, and for taping names on toothbrushes and combs to avoid mix-ups. Remember, "when you go on a trip, put a roll in your grip."  
—Joan Hall, Hudson, N. Y.

### PASTING WALLPAPER

As we do our own wall papering in our home I have found a little tool that is very handy. This is a discarded shaving brush. I use it for pasting small pieces such as the border and other narrow strips on which the large paste brush is unhandy to use. It saves time and makes a much neater job.  
—Gordon Smith, R. D. 1, Fort Plain, New York.

### EASILY CONSTRUCTED LIGHTWEIGHT ROW MARKER

One Rockingham County, New Hampshire, farmer made a simple lightweight row marker to be used for both small and big gardens by attaching a bicycle wheel to two old cultivator handles with a bolt. A couple short boards and 2x2 crosspieces completed this handy gadget.

### WELDING HINT

I am glad you found the information regarding the use of a worn clutch plate as a drain, useful. This prompts me to let you know that we have found ordinary baling wire a very good substitute for 1/16 or 1/8 rod when welding mild steel. Because welding rod is getting short I thought some farmers might be able to use this information. It works very well with a No. 5 Oxy-Acetylene tip. —Norman H. Foote.

### FOR MENDING

What's the handiest thing to take on a trip? I'd vote for scotch tape. Loose watch crystals, torn road maps, lost shoelace tips, torn beach umbrellas, or broken sun glasses won't spoil your fun if you have this handy roll of tape with you. It's ideal too for

### HAMMER HANDLES

Before putting a new handle in a hammer or an axe, coat that portion of the wood which is to be driven into the head with weatherstrip cement. It will prevent the handle from loosening even when subjected to extreme moisture changes. —Edward Monroe, Schuyler Lake, N. Y.

## How We Buy a Guernsey Bull

(Continued from Page 1)

production of the daughters of the sire. We like to get sires whose daughters average over 400 pounds of fat under normal farm conditions.

The type classification programs of the dairy breed associations have definitely shown that good dairy type is closely correlated with high production. Therefore, we visit the farm to look at the type of the daughters with emphasis on good conformation, size and scale, dairy character, and well-attached, evenly-quartered udders. We also like to look over the heifers and calves sired by the bull to get an idea as to how the progeny look at different ages.

Only by this visit to the farm can we find out what the herd management and feeding practices are, so we can estimate what effect they have had on records. Also, during our farm visit, we get an idea of what the bull's rate of conception is in natural service. And one final point—we want to see what the bull himself looks like. Thousands of people visit the NYABC headquarters on the Judd Falls Road in Ithaca every year, and we feel that bulls of good type are a good advertisement for our breeding program.

Finally, a thorough check is made to

be absolutely sure that the bull is in the best of health and free from the contagious diseases found in cattle.

All of these—research, studies and farm visits provide the background for a decision. Then comes the greatest problem of all—the weighing of the various factors—production of the daughters, conditions under which the daughters of a bull were fed and managed, pedigree, health, and individuality of the bull. These must be carefully considered before a decision is made. And, believe me, the bulls which you see at the Co-op are only the choice few of the great number considered each year by the NYABC sire committees!

It is encouraging to know that our members are breeding more and more cows every year to NYABC sires. This fiscal year, we'll top the 200,000 mark in the number of first services—a far cry from the approximately 3,000 bred in 1940. While we're looking constantly for better ways to select sires, we'll rest our case on the members' acceptance, and the average increase in production levels of herds using NYABC service. Personally, I know that the job of sire selection has been a great experience.

**THIS NEW ATLANTIC FLEET  
IS BRINGING YOU  
BETTER FARM SERVICE**

"And these shelves," I said, "hold more than you'll ever need. Let me set some out for you. See? Whatever you want--however much you want, I've got it for you."

"But what's all this stuff back here?" Al asked me. "That gadget," I said, "prints right on paper for your permanent records exactly how much gasoline, tractor fuel or fuel oils I've put in your tanks. So you can be away when I deliver and still know exactly what you got."

My truck is just one of the new Atlantic fleet. So get the best farm service you've ever had! Call us up at any of the telephone numbers at the right, above. Call right now! We'd like to have you for a customer and we'll take care of you right with the finest products you can buy--Atlantic products. Just give us a try.

**That's my new truck** behind Al Dalrymple and me and it's a dilly! When I drove up Al says to me, "Clair, you're getting kind of fancy, aren't you?"

"Not for a minute," I said, "this truck is a worker...there're two complete systems--one set of tanks, a meter and a hose for gasoline and tractor fuels and one for kerosene and fuel oils. There's no chance for any mixture."

## GRASS SILAGE A REVIEW

Prepared by Stanley P. Stabler

Extension Agronomist, University of Maryland

**G**RASS silage is a broad term that is used to designate all silage crops except corn and sorghum. It includes such crops as alfalfa, clovers, soybeans, orchard grass, timothy, bromegrass, and combinations of these crops. These crops differ from corn and sorghum in that special precautions must be taken ensiling them to get best preservation.

Important reasons for using grass silage:

1. Grass silage offers a method of preserving high quality forage during periods of poor haying weather.

2. The use of grass silage permits the farmer to keep a higher proportion of his land in grasses and legumes. This makes for greater soil conservation.

3. The use of grass silage provides a greater supply of home-grown proteins and reduces cash outlay for supplements.

4. Grass silage reduces the fire hazard.

5. It permits full utilization of surplus forage crops at any season at which they are available. The farmer who provides for an abundance of pasture in mid-summer is almost sure to have excess pasture during lush periods. Grass silage is a very efficient way to utilize this surplus feed and to have it available to feed back later in the summer when pastures may be short. The silo may then be refilled with corn for winter feeding. If pasture conditions are good and summer feeding of silage is not necessary, the grass silage will be equally good for winter feeding; and the corn may be harvested for grain.

The crops which are used to make grass silage are much lower in carbohydrates and sugars and much higher in protein than corn and sorghum. Due to this and particularly when the moisture content is very high, ensiling legumes is apt to result in putrefaction instead of fermentation and produce foul-smelling silage. If preservatives in the form of acids, or materials which are high in carbohydrates and sugars are added to grass silage or if the moisture is reduced to just the right amount, good silage results.

### Preservation

**Molasses:** One of the materials most used for preservation of grass silage is molasses. This material is high in sugar and makes conditions very favorable for proper fermentation. The use of forty to sixty pounds of molasses per ton of silage, when the price is low, is good insurance and economical. But it's now scarce and high priced.

**Ground Grains:** Ground grain such as corn, oats, and barley aid in proper fermentation. They also may have some effect as a drying agent, which tends to make conditions for fermentation a little more desirable and simulate some of the results obtained by wilting.

When grain prices are comparatively low, this is an economical means of preservation, and grain is much easier to apply than molasses. Many farmers who use this method have ground grain placed near the blower, and dump the required amount on the silage as it is being unloaded. The use of from 100 to 250 pounds per ton of silage gives good results. This material also adds

to the feeding value of the silage as only 15 to 20 percent of the nutrients of the grain are used in the process of fermentation; the other 80 to 85 percent remaining available as feed for the animal.

**Wilting:** Good grass silage can be made by properly wilting the crop before it is put in the silo. This method has several advantages over adding preservatives: (1) It is economical. (2) It reduces the weight of the material handled. (3) Wilting will reduce the amount of seepage.

A disadvantage of the wilting method is that it is often difficult to obtain the proper degree of wilting. Good grass silage can generally be made without a preservative if the moisture content of the silage is between sixty and sixty-eight percent. It is difficult to determine when silage has reached this moisture content. If the silage becomes too dry, it is apt to mold; if it is too wet, putrefaction may occur and unpalatable, smelly silage result.

The farmer inexperienced in making grass silage is apt to have considerable trouble the first time. Commercial apparatus for making moisture determinations is available but impractical for most farmers to own. There are a few simple farm tests which may be used: If when a small bunch of the unchopped hay is twisted tight juice is squeezed from it, the silage is probably still too wet. If twisting produces no dampening on the stems, it is probably too dry. The proper stage is when the twisted stems become moist but no juice is squeezed out of them.

Another simple test is to take a handful of the chopped material, pack it into a tight, round ball in the hand, then open the hand, leaving the ball of material on the palm. If the ball stays packed tightly together, it is too wet. If it tends to spring apart and fall to pieces, it is too dry; however, if it tends to spring apart slightly but not fall to pieces, it is about right.

Many farmers use a combination of the different methods of putting up forage in their farm operations. When the crop they wish to harvest is ready, they start mowing. They start filling silo at the same time, using a preservative with the green material. If weather conditions are favorable and sufficient drying occurs, they will omit the preservative and continue to make silage by the wilting method. If drying conditions are particularly favorable, they will allow some to dry enough to be put up as hay. If conditions are unfavorable and the material remains wet, the harvesting may be continued and a preservative used. By this combination of methods, it is generally possible to maintain full-day operations regardless of weather and at the same time to have good quality forage in the form of both hay and silage.

It is easier to make good corn silage than good grass silage, and it is probably that corn will always fill an important place as a silage crop due to its high yielding ability. On the other

hand, the many advantages of grass silage offers indicates that more of it will be used in coming years.

World and labor conditions make modern equipment for putting up grass silage more important than ever. One man with a tractor, field chopper and trailer wagon can make short work of a field of grass.

# "I spend only— 23 cents to haul 3200 lbs. 10 miles!"

—says ALEX FORSHAGE, Jr., of San Marcos, Texas

He drove a 1950 Ford F-5 Stake equipped with Power Pilot in Ford's nationwide Economy Run. He says, "My Power Pilot equipped truck gives top performance with real economy —and this combination is unusual."

**Stockman Forshage** works his truck six to eight hours a day, on all kinds of roads. He says, "Ford's Economy Run opened my eyes to how little it costs to run a Ford Truck. For example: In six months I traveled 5778 miles with an average load of 3200 lbs., made 1444 stops. My hauling cost of gas, oil and maintenance with nothing spent for repairs came to \$135.68 and that's only 2.34 cents per mile!"

Like others who rely on Ford for greater savings—you'll like the low-cost truck service at Ford Dealers' everywhere. And, for more facts on the trucks that last longer *and* save you money every mile—mail the coupon at lower right today.

**Smart Farm Operator** Forshage frequently turns off Texas roads . . . drives truck cross country. He says, "Even off the road, my Ford F-5 Truck steers and handles easily!"

This new Ford F-5 Stake for '51, like Forshage's truck, is the biggest seller in the heavy duty class. It offers new 5-STAR and 5-STAR EXTRA Cabs with 50%

wider rear window and other features for more efficient driving. With a choice of over 180 models, there's an economical Ford Truck to fit *your* job, V-8 or Six.

## FORD TRUCKING COSTS LESS

because FORD TRUCKS LAST LONGER

Using latest registration data on 7,318,000 trucks, life insurance experts prove Ford Trucks last longer!

## New York City Plans for a "Dairy Council"

**A** DAIRY COUNCIL in the New York Metropolitan area now seems almost certain. On May 1, representatives of a number of dealers in New York City met at the Hotel New Yorker. The meeting was arranged by a committee which included: Irving Wisch, president of Milk Processors and Handlers; F. J. Lapeire, president of Milk Dealers of Metropolitan New York; Dan Lieberman, president of Independent Milk Marketers; Ted Greenway of Dairymen's League; E. H. Miller of Sheffield Farms; Frohman Holland of Holland Farms; E. O. Mather of Dellwood Dairy; Al Sperber, secretary of Milk Processors and Handlers; Ed Vial, secretary of Milk Dealers of Metropolitan New York, and F. P. Willits of the Borden Company.

At the meeting, the Dairy Council contract was signed by Irving Wisch of Hegeman Farms as president of Milk Handlers and Processors, Dan Lieberman of Maplewood Farms as president of Independent Milk Marketers, and Frank Lapeire of Waddington Dairy as president of Milk Dealers of Metropolitan New York.

In the case of some dealers, the signature of someone not attending the meeting was required, and in the case of the Dairymen's League, Sheffield Farms and Borden's it was necessary that the matter be acted upon by the Board of Directors before a definite commitment could be made.

### Dealers Match Funds

Dealers who sign this Dairy Council contract agree, collectively, to turn over to the Dairy Council a sum equal to that turned over by dairymen shipping milk to the market. That is the way a Dairy Council works wherever it is set up in a specific market.

Back of the action by dealers on May 1, there is much history. It started with the formation of "Milk for Health," an organization of milk producers designed to secure dairymen's consent to a deduction of 1 cent a cwt. on their milk, the money to be used for milk promotion and milk advertising campaigns. An agreement was reached that seven-twelfths of the amount thus pledged would go to the National Dairy Council

and five-twelfths to the American Dairy Association.

For a time the response of dairymen was slow, but it has been "snowballing" in recent months. At least 90 per cent of the producers contacted have agreed to support the plan.

### Councils Organized

Already 7 upstate Dairy Councils have been started. These are located at Elmira, Binghamton, Poughkeepsie-Newburgh, the Capitol District, Utica-Rome, Syracuse, and Plattsburg. Typical of annual meetings of these upstate Councils was the one recently held at Binghamton. Fred Lawrence, a milk producer in Broome County, was elected president. Other members are Floyd Gardner, Binghamton, treasurer, and Mr. B. Greene of Binghamton. Dealer members are Albert Cornell of Endicott, vice president; Leo Boland, Binghamton, secretary, and Ray Short of Binghamton.

The report of Ruth McClung, director of the Council unit, was very encouraging. Schools, medical associations, dental associations and consumer groups have accepted the milk promotion program with enthusiasm. More than 28,000 pieces of "milk promotion" material have been distributed in places where they will be effective. The cooperation of many health groups means that the effectiveness of the Dairy Council dollar is multiplied many fold.

For months the American Dairy Association (ADA) has been advertising milk and its products on bill boards, express agency trucks, and in magazines. Here too, there is frequently a tie between a dairy product and some other product, such as a breakfast food, which increases the effectiveness of the dollars dairymen contribute.

Many statements have been made by leading authorities showing the tremendous financial returns to dairymen of increased consumption, particularly of fluid milk. Every additional glass of milk which is consumed makes one less glass to be figured into some surplus class at a lower price. "Milk for Health" is doing a job that needs to be done.

The Allegany Co., N. Y. Farm Bureau Dairy Committee continues to promote the leading industry of the county. At a recent meeting of the dairy commodity committee and restaurant and diner proprietors, a milk promotional program was planned which is hoped to increase the sales of the most refreshing drink—Milk.

More than 100 posters, of the type shown above, were handed out to restaurant proprietors and milk retailers. This sign was designed and sponsored by the Dairy Herd Improvement Association supervisors of Allegany County. Here, Robert Stowell of Belmont, center, chairman of the Allegany County Farm Bureau Dairy Committee, hands Forrest Clark, proprietor of the American Restaurant at Belmont, the first poster. Karl Vessler, right, a member of the Dairy Committee, is looking on.

## Long Hours Help To Offset Slow Season

By L. B. SKEFFINGTON

**S**PRING continues backward and hesitant upstate, with much farm work one to three weeks behind normal. Only trifling acreage of oats and peas was planted until the first week in May. By way of contrast, two years ago many of these same farmers had finished similar plantings before the end of April. This year the soil has been too wet for plowing. Frequent rains and absence of drying weather through April was the rule.

Delay in getting land plowed and oats in will undoubtedly delay much corn planting. Peas have been going in rapidly. On many farms, plows and planters have been operating until dark, and in a few places practically around the clock.

Due to ground being cold and soggy so long, pastures have been slow to start. Much wheat has a yellowish color. Where wheat was top-dressed in March with nitrate frequently, much better color and growth are noted.

Apple growers have had a particularly difficult time because it has been "scab weather" and soggy orchards in many cases have made it difficult to get around with spray rigs. This year quite a number of "speed sprayer" adaptations for conventional sprayers are seen in the orchards.

### Growers 'Stand Pat'

The State Tomato Committee of the Canning Crops Growers Cooperative reports substantial acreage under "approved" contracts with processors. Harold Shepard of Elba, committee chairman, says the main thing now is for growers to "stand pat" on the terms they agreed upon.

Prices offered by most processors are said to be in line with the co-op's request, in line with the "legal minimum" of \$32.70 per ton as computed by the USDA. John Martin of Brockport, co-op president, says differences with processors center mostly around recognition of the cooperative as the sole bargaining agency of the growers and deductions for dues.

During the past winter the cooperative voted its bargaining rule in effect when membership acreage passed more than two-thirds of the state's estimated

tomato acreage. Members who sign an unapproved contract with a processor make themselves liable for \$75 per acre penalty.

\* \* \*

### Boys Worth Watching

I wonder how many farmers seeking ideas on how to do things the handy way ever check on what is being done in high school vocational agriculture classes? The other day I stopped in at Livonia. Eugene Huff, the teacher, showed me a silage cart and an implement carrier which boys had just completed. Both of these pieces offered advantages over conventional methods.

\* \* \*

### Goose Market Booms

A new and strong demand has been building up for geese in Western New York. They are wanted by strawberry growers to keep their fields weeded. I

have heard of growers paying as much as \$5 a bird.

In recent years the problem of keeping beds weeded has become serious because of scarcity and cost of labor. Then someone recalled the old story that geese would do the job without injury to the berry plants. Several growers, including Leslie Stutzman of Greece and Donald Shoemaker of Webster, gave it a trial last year and unqualifiedly indorse the geese.

The plots must be fenced, and water and a small amount of feed provided. Where a row of water buckets is placed through the field, the geese spread out their operations accordingly.

\* \* \*

### Camps Being Readied

All over the state where large amounts of harvest labor are needed, camps are being made ready. In the

Elba area, Henry Mosbaugher, president of the labor cooperative, says \$25,000 subscribed by growers is being used to enlarge and spruce up the camp property.

\* \* \*

### Spray Kills Cattle

George C. Moore, district soil conservationist, has lost 10 purebred Angus cattle in an unusual mishap. At his farm on Preemption Road, Geneva, he had some sulphur spray material which had hardened in the bags. It was run through a hammermill to break it up. Some time later some feed for the cattle was ground in the mill. Next day, after feeding, the cattle began to die.

Poisoning was apparent, but how? That was the mystery as more animals dropped off. Post mortems traced the poison apparently to synthetic substances included in the spray material.

## A familiar voice steps into your home

It's that of neighbor or friend — so real, so much like her, she seems there beside you.

Telephone voices sound close and clear because telephone service is good. It's swift and sure and the person at the other end of the line is right at hand.

In the rural areas of the Bell System we keep improving service while building lines and adding telephones. Today, more than nine out

of ten families have lift-the-receiver telephones. Over nine out of ten also have improved ringing, which means they hear fewer rings of other parties on the line. And we're steadily reducing the number of parties on each line.

The best rural telephone service in the world is right here in America. That's especially important in these days of increased production and national defense.

**BELL TELEPHONE SYSTEM**

**HER CHOCOLATE CAKE WAS BEST:** Miss Greta Austin, of West Exeter, N. Y., baked the cake that took first prize in the Otsego County Chocolate Cake Contest, in which 23 of Otsego's 27 Subordinate Granges took part. Miss Austin will compete with winners from other counties at the finals at State Grange next October, when cash and merchandise prizes will be awarded to state winners. This is the 16th annual baking contest to be sponsored jointly by American Agriculturist and the New York State Grange.

# Identical Twin Heifers used in Amazing Feed Test\* at DAWNWOOD FARMS

**CANDY on Milk**  
gained 103 lbs. in 3 months...  
COST **\$57<sup>33</sup>**

**SANDY on CAF-STAR**  
gained 112 lbs. in 3 months...  
COST **\$14<sup>95</sup>**

\*Test conducted under normal dairy farm conditions. Weights taken monthly by E. Van Steenburgh, D.H.I.A. supervisor.

We take pride in the calves we raise on our farms. That's why we created CAF-STAR. When the identical twin heifers, Candy and Sandy, were born, we made the famous feed test which *proved* that CAF-STAR helps develop bigger animals with better bone growth—and at a big saving. We feel that all dairymen should know about CAF-STAR.

Cordially,

*Dawnwood Farms*

Just mix CAF-STAR with water and feed quart for quart instead of milk. The 25-lb. package feeds a calf for one month at a cost of 16 cents per day.

Buy at your feed dealers in 25-lb. bags or 100-lb. (economy) bags. (Metal pails sometimes available.)

DAWNWOOD FARMS, AA-3, Amenia, N. Y.

## A Memorial Day Visit With The Editor

By E. R. EASTMAN

SOME YEARS ago, on a soft spring day in the month of May, my son George and I left Washington to visit some of the Virginia Civil War battlefields, where my father spent four tempestuous years. My Dad has been gone these thirty years, but not in life was he ever closer to me than he was as I walked with George, who very much resembles him, through these Virginia woods, and thought of him on those other May days when these same woods were murky with the smoke of battle.

On the Rappahannock River there is a steep mound or hill overlooking the town of Fredericksburg, which was the scene of some of the hottest fighting. After the war, the United States took over this hill as part of a national park, and took 15,000 Union dead from the nearby battlefields—Fredericksburg, Chancellorsville, and the Wilderness—and interred them in a national cemetery on this hill. The guard told us that over 12,000 out of the 15,000 Union boys could not be identified by name; so they sleep there in Dixie in unknown graves.

As we walked with reverent step down the greensward of this hilly place, I thought of the fathers and mothers of these boys, and the thousands of other parents of both North and South whose boys went away to Civil War, never to return. Never have I been in a place that represented more concentrated woe or sorrow. At this Memorial Day let us think of the 12,000 mothers of those sons in unknown graves who waited for years after the war, eating their hearts out with hope, forever listening for the returning footsteps of lost sons! The only word many of those mothers ever received was a report from the War Department that the son was "missing" after the battle. Let us think also of all those other sons who have given their lives since the Civil War that this Republic and what it stands for may endure.

NO one can stand in one of these great cemeteries of war dead without thinking: "Why, oh why, all this sacrifice?" But there is an answer. Our fathers believed they had found something in this American democracy that was infinitely precious, far beyond the value of life itself, and they fought for it. What is this thing we call liberty? What is it our fathers thought they had? Is it just a meaningless high-sounding word? To answer it, take a look at the Old World before the landing of the Pilgrims. Slavery was world-wide, women in most countries were not much better than slaves, the home as we know it today did not exist, education was confined to monasteries and to a few in the upper classes, freedom of worship did not exist, those who tried to worship according to their conscience were persecuted, there was little or no political freedom, government was based on "the divine right of kings", which meant that the individual existed solely for the state, not the state for the individual. Might always made right, oppression and taxation stalked the land, privation and suffering were the common lot. Make no mistake, either, many of the same conditions still exist in the Old World today. Even England is fast being ruined by socialism.

Those were the conditions that the

Pilgrims, the Puritans and the other New World emigrants left behind them. Do you wonder that they gloried in their new-found freedom, in the opportunity in the new air of a new world for the individual soul to flower? These first American settlers knew from actual bitter experience what they had escaped from in the Old World. They never forgot it, nor permitted their children to forget the blessings of liberty. Their bitter experience and the glory of new-found freedom were common talk in every American household for generations, even down to the Civil War. To our fathers, democracy was a synonym for true religion founded on the fatherhood of God and the brotherhood of man. It was a synonym for political freedom, the right to appoint or elect their own leaders and put them out when they failed. To them, democracy meant that the individual and not the state is paramount. To them, democracy meant not the divine right of kings or dictators but instead the divine right of the individual and the human soul.

BUT today we have been so long used to the blessings of liberty that we take them for granted, count them for little, and are ready to trade them for a mess of pottage. We seem to forget that nothing that we can ever receive can repay us for the loss of liberty as we have known it here on this soil for more than ten generations. We seem to forget the price our fathers paid for our privilege of living in a democracy. Tennyson once said that we are

"Heirs of all the ages  
Standing in the files of time."

How true that is of the splendid heritage that our forefathers have given to us Americans!

The question now is, what are we going to do with that heritage? We must do something if democracy is to endure. For now the world is faced with two opposing schools of thought. One school is a strong-arm school, whose chief proponents are the dictators, who believe that democracy has failed, who would put the state first, who would restrict initiative, individualism and personal responsibility, who believe that might makes right. Even in America we see the creeping in of this idea through the iron hand of central government and the false promises of socialism. Let those have their way who believe that government can do everything and is all-powerful, and we will go straight back to conditions in the Old World which forced the early colonists to come to America.

Thank God most Americans still believe in the slower but sure processes of democracy worked out through education and cooperation, with emphasis upon the innate value of the human soul, upon personal, religious and political liberty!

But do we hold these beliefs strongly enough to be willing like our fathers to fight for them? Are we willing, like our fathers, to depend more on ourselves and less upon government? Are we willing to tell government instead of having government tell us? In short, how much do you care?

That's something to think about at this Memorial Day time in this year of our Lord nineteen hundred and fifty-one.

# Slick as a Whistle

**1.** THE RUBBER BELT of the G.L.F. Stable Cleaner moves steadily out, taking the manure and bedding right to the spreader. There's nothing in the gutter but the belt.

**2.** TWO MINUTES LATER the belt is returned, clean. The gutter cleaning job is done—no wheelbarrow, no shovel, no work. Another two or three minutes clean the other gutter.

## How the G.L.F. Stable Cleaner is Working Out On the Arling Kiefer Farm

**ARLING KIEFER, Jr. and Sr.**, operate a father-son partnership at Bangor, Pa. They have a G.L.F. Stable Cleaner installed in two gutters behind 34 Holsteins. Arling Jr. reports on their experience with this farm tested dairy implement:

**Simple to Install.** "At our place it took four hours to extend the gutter through the end of the barn, three days for the concrete to set and four hours to install the cleaner. Actually the cleaner was brought to our farm at noon and at 4:30 that same afternoon we used it to clean out the gutters."

**Labor Saving.** "It's the best thing ever made to cut out heavy work in a dairy barn. I wish that all our cows were in the two rows so that we wouldn't have to use the old wheelbarrow and ramp method for the other cows."

**Cuts Chore Time.** "We used to take three-quarters of an hour in the morning and a long half-hour at night to clean out the barn. Now we just pull a switch and the barn is clean in six minutes without any labor."

**Saves on Help.** "I had the flu for nearly a week and our man took care of the 45 milk cows and the 45 head of dry stock and heifers in two barns all by himself without having to hire any extra help. If we hadn't had the automatic cleaner for 34 of our cows this certainly would not have been possible."

\* \* \*

The G.L.F. Stable Cleaner is the simple, practical answer to the meanest job on the farm. Tested and perfected in actual farm use, it will soon be available at all G.L.F. Service Agencies. Ask about it. Cooperative G.L.F. Exchange, Inc., Ithaca, N. Y.

## Camp Miniwanca Scholarship

**A** **AMERICAN AGRICULTURIST** is once more offering a scholarship with all expenses paid for a two weeks' leadership training course at Camp Miniwanca, Shelby, Michigan. The scholarship will be awarded to some young man in the Northeast between the ages of 17 and 21. It might be you. The winner will be chosen primarily on the basis of leadership experience in organizations to which he belongs.

Miniwanca means "many waters," and is so named because it is located on three extensive waterfronts—Lake Michigan, Stony Creek, and Stony Lake. This 300-acre camping paradise is located in the heart of the famed fruit belt and wooded sand dune country of western Michigan.

Camp Miniwanca is owned and operated by the American Youth Foundation—a non-denominational Christian organization dedicated to the purpose of assisting young people in youth-training and development. There is plenty of action at "Miniwanca" and high adventure is in store for those whose privilege it is to attend.

### How to Enter

Send your application to **AMERICAN AGRICULTURIST**, Dept. M, Box 367, Ithaca, N. Y., and give the following information:

1. Your age.
2. The youth organizations to which you belong, the honors you have won as a member of these organizations, and the leadership contributions you have made to them or to your local community.
3. Include the names and addresses of 3 adults other than your parents as references.

If you older readers know of some young man who might be interested in the scholarship and who would profit by it, we would appreciate it if you would call this opportunity to his attention. Please act promptly as the deadline for accepting applications is June 15.

Last year's scholarship was won by Joseph Mitchell of Hockessin, Delaware. —A.A.—

## Growers Give Hints on Raising Potatoes

**A** **T** **THE** recent potato show at Wellsville, a joint convention of growers from Alleghany County, New York, and Potter County, Pa., a number of growers told some interesting personal experiences.

One grower used a small crew and spread his harvest operations over 7 weeks instead of the usual 3. He reported that he saved money because he was able to keep the pickers busy. He was in contact with the men at all times, they always had crates, and, interestingly enough, the workers liked the program.

Another experience reported was hauling potatoes to storage in an old school bus from which the top had been removed. It was possible to load the potatoes without having a man on the rig. This saved labor, and the fact that the bus was well equipped with springs cut down on bruising.

Here's a comment about marketing: one grower continues to market potatoes till late May or early June. Furthermore, he keeps in close touch with his customers and sells direct to many consumers.

A good wrinkle in disease and insect control is the planting of 6 rows, leaving 2 rows blank and then planting 6 more. This leaves an area where sprayers can travel without damaging vines and also provides an area for moving irrigation pipe. The number of rows

Stanley Ellsworth, Orono, Maine, winner of a Ralston Purina Fellowship who will do graduate research in dairy and nutrition at Michigan State College. Stanley is a native of Farmington, Maine, and will get a B.S. degree in Dairy Husbandry in June.

planted before each skip can be varied to suit your equipment.

One grower uses a trailer to haul potatoes in bulk from the field. The wheels of this trailer straddle 2 rows, and potatoes from 4 rows are picked from each side and 2 from the rear. Potatoes are picked directly into the trailer. Six or 7 pickers work in a group. One man dumps the potatoes into the trailer which holds 90 bushels. There is a hole in the bottom of the trailer which is covered with a plywood section which can be removed allowing the potatoes to drop a few inches to an elevator which takes them to the bin. The pickers are paid as a group.

It is amazing how many ways there are to do the same jobs and how many hints can be picked up from a forum in which growers participate. Observation indicates that potato growers enjoy a forum of this sort as much as any type of program. The big handicap in running such a program seems to be the difficulty in getting growers to talk about their own operations.—H.L.C.

—A.A.—

## ANGUS SALE AVERAGES \$677

**FIFTY** head of cattle sold for an average of \$677 at the 15th annual Northeastern Aberdeen-Angus Breeders Sale on April 28 in the Cornell Livestock Judging Pavilion.

This was the highest average in the history of the sale, according to Prof. J. I. Miller of the Department of Animal Husbandry, secretary of the association. Last year's average was \$502. The total received this year was \$33,870. About 400 persons attended.

Firland Farm of Sand Lake, N. Y., paid the top price of the sale, \$2,200 for a bull. Top bred heifer brought \$1,250 from Stillwater Farm, Salisbury, Conn. The highest priced open heifer sold for \$1,025. —A.A.—

## WHAT IS "GOOD"?

Perhaps you remember the story about the man who wanted to sell a cow. The buyer asked about her production, and the seller replied that she was a good cow and certainly would give him all the milk she could. The story is retold here to illustrate the fact that the term "good" applied to any cow is far from definite.

To the minds of most dairymen, a good cow is one of the best he has in his whole herd. If the owner's aim is to get a herd in which all of them are as good as his best cow, this is a very desirable goal.

Certainly setting some kind of a goal adds greatly to the interest of keeping a dairy, and the man who increases his goal as his average production nears it will surely be numbered among the prosperous dairymen in his area.

# TWO HEADS

## Are Better Than One

By  
HUGH L. COSLINE

THERE'S no question but that the amount of capital required before a young man can start farming adds up to a staggering amount. Some doleful souls conclude "it can't be done" but a more logical answer is that in some way "it must be done." The problem is how.

One answer, and the best one for some families, is a partnership between father and son or even between a successful farmer and a young and ambitious hired man. One of the many examples in the Northeast is the father and son agreement between Milton Scutt and his son Bob near Friendship, Allegany Co., N. Y., which has been in operation for the past two years at "Utopia Homestead."

While the exact details may vary, a successful partnership measures up.

1. The business should be big enough to support two families.

Utopia Homestead didn't meet this requirement so an additional 240 acres have been rented. A 22 x 36 hen house has been built, the dairy increased from 21 to 26 cows with more due to freshen this year, and the maple sugar business has been enlarged.

2. The deal must be fair to both.

Mr. Scutt left his dairy on the farm and when any of the original animals are sold the money is his. However all animals raised on the farm since the partnership started are jointly owned. After expenses are paid, net profits are divided equally.

Bob is interested in owning the farm someday although he is not ready to buy now. They have discussed this and made some arrangements. If the farm is ever sold, Bob has the first option to buy it.

3. There must be mutual confidence.

Both Bob and his Dad seem satisfied. All major management problems are discussed. Sometimes they differ on points but they talk things over and come to a mutual agreement. Sometimes one gives in and sometimes the other. The combination of experience and the enthusiasm of youth make a wonderful team.

4. The families must live apart.

It is poor business for two families to try to live together. No kitchen is big enough for two cooks. The Scutts met this situation by dividing their house into two apartments. They live apart, yet the grandchildren are close enough so grandpa and grandma can enjoy them.

5. The contract should be written rather than verbal.

The Scutt agreement is in writing. The advantage is that a written agreement must be definite and is not subject to memory. The Scutt agreement is relatively simple but covers important points in regard to the business.

Obviously a man like Mr. Scutt who has reached 51 years of age and who has accumulated an estate, is entitled to enjoy it. But equally obvious is the fact that a 28-year-old son working on the farm will, as time goes by, add to the value of the farm property. Both have rights in the business which need to be protected by a written agreement.

For "Utopia Homestead" the labor problem is largely solved. There are

two reliable, steady workers on this farm. Yet they say that they have flexibility in that they are not tied to the farm 365 days a year. Either can be away from the farm for a short vacation with confidence that the work at home will be carried on as it should be.

Two circumstances, occurring simultaneously over two years ago brought about this agreement. Milton Scutt was ill. He had rented the farm for a year but the tenant had bought a farm of his own. At the same time 28-year-old Bob, who had attended Alfred University, was out of a job when the employer he had worked for in New Jersey sold his herd. The partnership arrangement was made, Bob took over and gradually Mr. Scutt regained his health.

A good partnership agreement can

Milton Scutt and Son, Bob, looking over some of the figures on the year's operation.

work to the benefit of the father and of the son and be a real asset to the community. It's worth thinking about.

To many, the idea of going into partnership with a hired man will seem less logical. But in the case of a farmer without sons or with sons who are definitely headed for some other vocation, is there a better solution? Some farmers in the State have taken their hired men into partnership with them and are finding it works out well. So it is being done! It can work to the advantage of both the farmer and the young man who wants to get started.

In New York State, Art Bratton of the College of Agriculture at Ithaca, has been studying the essential and desirable characteristics of such agreements. If you are about ready for such a partnership, either with your son or hired man, drop Art a line. He may be able to help.

— A. A. —

### POLE BARNS FOR BEEF CATTLE

Inexpensive buildings are required for profitable beef production. A pole barn may be the answer to your problem.

Such barns do not require a concrete footing and foundation. The side walls and roof of the building are supported by 5" top diameter poles 20 to 25 feet long set in the ground to a depth of about 4 feet. 2"x8" and 2"x10" plank are used for plates and rafters. 2"x6" material is used for nailing girts to which vertical siding is applied. Corrugated metal roofing may be placed on 2"x4" roof purlins spaced 24 to 40 inches apart, depending on the type of metal roofing used. Such construction eliminates the need of a relatively tight roof deck. Doors can be provided in the sides and ends of the pole barn as desired.

More detailed information can be obtained from the Department of Agricultural Engineering at Cornell.

TO TURN HER MILK  
INTO DOLLARS—  
TURN HER CALF  
OVER TO KAFF-A!

### The safe replacement for milk in calf feeding

Don't waste milk on calves! It's not necessary with Kaff-A! Low cost Kaff-A is an absolutely safe replacement for milk. When you feed Kaff-A, the milk your cows produce goes to the dairy—puts dollars in your bank account. Just 1 lb. of Kaff-A can replace up to 10 lbs. of milk in calf feeding. That means every 50 lb. box fed with low-cost hay and grain can release as much as 500 lbs. of milk you can sell! And that adds up to a handsome extra profit!

With Kaff-A no milk is needed after the 10th day. Kaff-A is tested, tried, proved a safe replacement for

milk. A million healthy heifers have already been raised on it! Its dried buttermilk base is known for its nutrition. In addition, Kaff-A contains other dairy by-products, some cereal products, and plenty of Vitamin A and D Feeding Oil!

Don't risk your calf's health on inferior imitations of Kaff-A. A few pennies saved now may cost you many a dollar if your calf becomes a stunted cow. Feed Kaff-A and be sure that your calves get the nutrition that helps develop good milkers... good breeders! Get Kaff-A from your feed store or milk plant today.

## A FORUM FOR Backyard Gardeners

**I** HAVE always maintained that I knew something about growing a home garden. Even so, I admit there is always something to learn, and recently I have been learning about growing plants in an electric hotbed.

I promised to report results, and since one lesson was learned the hard way I will tell you about that first. Knowing that I would be away for four days on a business trip and wanting Mrs. Backyard Gardener to go with me, I carefully watched the need of the young growing plants for water and decided that if I watered them thoroughly just before I left they would be happy until I returned. My conclusion would have been correct if we had continued to have the same kind of weather, but it turned hot and sunny, and when I returned the plants in several flats were thoroughly dead. Incidentally, it was the only hot spell we have had this spring.

The situation was met partly by spending 25 cents for some tomato plants about the same size of those that were killed, and partly by sowing more seeds of some vegetables and flowers where time was less important.

In spite of the fact that I was well aware of the dangers of "damping off," and in spite of the fact that I dusted the tomatoes with a copper dust I lost a few tomatoes with that trouble. That and other hazards are good reasons for starting more than you will need.

I believe that lack of sunshine was the chief reason for the damping off which, as you know, is a fungus which attacks the plants just at the surface of the ground. It is always wise to water plants in flats early on sunny mornings so the surface of the dirt will be dried by sunshine. That is a good practice to follow, but what are you going to do when you don't have any sunny mornings?

Anyway, the hotbed is now full of flats with plants in various stages of growth and with the lessons I have learned I expect to do better next year.

\* \* \*

### African Violets

Some of my friends claim it is not wise to divide African Violet plants. So, just for experimental purposes, I tried it and the results have been excellent. In this case, however, the plant I divided had only one new plant started in contrast to some I have seen which had so many they were very crowded.

Starting African Violets from leaves is slow but interesting. We get the best results by putting several leaves in sand in a flower pot and then putting the pot in another container so it can be watered from the bottom. It takes a long time to develop new plants so don't get discouraged so long as the original leaves stay green.

\* \* \*

### Lawn Chores

When I rolled the power mower out to get it started I found that compression on the Briggs-Stratton motor which runs it was practically zero because the oil had drained away from the piston rings during the winter. Taking out the spark plug and putting a few squirts of oil on the cylinder-head soon started it off.

Generally we find that we start to mow our lawn a few days later than many of our friends. A freshly mowed lawn looks neat but we think it wise to let the lawn get a good start before mowing. Previous to mowing we had filled in a few low spots and lightly

raked in some grass seed. Fortunately this past winter was not as hard on the lawn as some have been.

\* \* \*

### Don't Plant It!

I planted some golden cross sweet corn last spring which I bought in a seed store. I got a good crop from it, and last fall I saved the seed from this hybrid corn to use this spring. Now I am wondering if I should use it. Will it produce a good crop? What do you suggest?

I am glad that you asked about this before you planted the seed, because you certainly would have been disappointed. Hybrid seed is produced through a rather complicated process and the production of it is strictly a seedsman's job. Regardless of the crop, do not save seed from a hybrid. It just doesn't work.

\* \* \*

### More Fertilizer

Our experience indicates there's little danger of killing plants with commercial fertilizer. Of course we don't put fertilizer right in the row with seeds, especially such seeds as peas. However, being a little dissatisfied with the growth our rhubarb made, I put about 3 double handfuls of 5-10-5 around each plant in the fall of 1949. The response a year ago was excellent and again this year they are really starting off as though they meant business.

Asparagus is another crop that can stand a lot of fertilizer. Well-rotted manure is good if you have it but commercial fertilizer does very well. If your asparagus bed does not produce sizeable spears try doubling or tripling the usual application of fertilizer after the cutting season is over.

\* \* \*

### A Boost for Crocuses

Last fall we set out a few crocus bulbs by each of the gate posts and already have been well repaid for the small cost. They are just about the earliest blossom to show, and this spring they have lasted very well. They were still in bloom the last week in April, much later than usual due to a cool spring. — *The Backyard Gardener*

About 9 years ago I set out two sweet cherry trees of different varieties. One lived and one died. Up to 1950, in spite of good bloom, we never had a decent crop of sweet cherries, and thinking lack of cross-pollination might be the cause, I hung a fruit jar with some branches of a different sweet cherry variety in bloom in the trees at blossoming time.

We had an excellent crop of sweet cherries and personally I am sure that the cross-pollination caused it. I am planning the same procedure this year.

# SPRAY

with Reliable, Dependable

## to kill APHIDS

Black Leaf 40® is economical! One ounce makes six gallons of spray which protects your orchard and garden from infestation by aphids, leafhoppers, most thrips and other soft-bodied sucking insects. It kills these pests two ways—by contact and by fumes.

Black Leaf 40 spares bees and other beneficial insects, never stains or burns and leaves no unsightly or objectionable residue on flowers, foliage or fruit.

Black Leaf 40 is also used as a roost paint to kill chicken lice and mites...as a dip and drench for certain animals...and as a repellent to keep dogs away from shrubbery. Full directions on each package. Sold at drug, hardware, seed and farm supply stores everywhere.

# The Problem of "When to Start Chicks"

By L. E. WEAVER

**W**E ARE all through with very early hatched chicks, says a correspondent in one of the current farm periodicals. He then tells about getting chicks in January, being "tickled pink" when they started laying in July, disappointed when they molted in October, and disgusted when they failed to come back into profitable production. This year he got his chicks the latter part of March and figures he will get no molting "when eggs are at their highest."

One might argue, with plenty of proof to support his argument, that either this man's management of his pullets was faulty or else the chicks he purchased were not bred-for-high-production. Too many successful commercial poultrymen are starting chicks in January each year and getting high egg production when egg prices are at the peak, and without any serious amount of molting, for us to let one man's unfortunate experience dampen our enthusiasm for very early chicks.

The main reason, however, for bringing up the subject at all, is that the best time of the year for getting chicks started is undergoing quite a lot of re-examination at the present time. I am going to give a few slants that have appeared in recent publications. I am not going to draw any conclusions further than to say that at the moment it appears to me that the best time of the year to start chicks will be different for different people, depending on their different situations.

**Spring Hatches Most Profitable in New Jersey Test.** A three-year test was run at the New Jersey Agricultural Experiment Station with White Leghorns. Chicks were started at approximately 2½ month intervals on five dates—June 15, September 1, November 1, January 15, and April 1. They were grown to maturity, and records were kept of number of eggs laid, amount of mortality, and efficiency of feed during one year of laying.

The birds hatched April 1 were most profitable. They laid 172 eggs per bird. June 15 birds laid 166; January 15 birds, 150; September 1 birds, 149; and November 1 birds, 140. Fifty-five per cent of the April pullets' eggs were large, while the January, November, June and September flocks followed in that order with 47, 43, 42 and 38 per cent large eggs respectively. With medium eggs the April birds were "medium" with 34 per cent; June and September pullets produced 48 and 42 per cent mediums, and November and January pullets laid 31 and 32 per cent of medium size.

November hatched pullets started laying at the youngest age—170 days. April and June birds were tied for late starting—188 days. However, April birds were most persistent. They kept going for 481 days, almost 100 days after the November birds quit at 372 days. That, I suspect, is perhaps the chief reason why they made the most money. The report states that "spring-hatched birds produced as many eggs when prices were highest as did the fall-and-winter-hatched chicks."

**New Hampshire Suspects Light Hastens Maturity.** Dr. Ringrose in New Hampshire is running an experiment which will not be concluded until after all lights are turned off, but he stated in a recent report that up to 24 weeks of age, neither egg size nor maturity had been influenced by the method of feeding. Some pens were on a restricted feeding schedule, others on

a heavy oats diet designed to delay maturity. On the other hand when chicks were on a normal feeding plan, the lights, according to Dr. Ringrose, "had the desired effect of delaying maturity and increasing egg size." His explanation is that chicks hatched in mid-October, November, and December are nearing maturity in February, March and early April, a time when days are rapidly increasing in length.

**Cornell Study Finds January and February Hatches Most Profitable.** Doctors Darrah and Searls at Cornell reported last November that "in 1946-47, New York State poultrymen who started light bred chicks in January and February made profits of 8.0c per dozen eggs, while those who started their chicks in March, April, and May made profits of 2.8c."

Then these men started wondering if it wouldn't be even more profitable to start chicks still earlier, say in December or November. They had actual figures from one such farm. So they worked out a table of adjusted costs, returns and profits that might result from starting chicks each of the 12 months of the year, assuming that the totals of feed consumption and other costs, and rate of egg production remained unchanged from the actual totals, but applying the cost of feed and selling prices for eggs that actually prevailed in each month. They came up with the conclusion that pullets put in the laying house in April should be most profitable. They would have been started as chicks in November or late October. The increase in returns would come mostly from the higher prices at which medium and large eggs would be sold compared with other months.

These men willingly admit that there may be some catches in their scheme which would make it impracticable. They ask, "will hens raised in the winter be as healthy and vigorous as those started later?" "Will they actually lay as many eggs as we have assumed?" What about egg size? And can the added income make up for the cost of additional buildings needed?" More studies, they say, are needed.

The New Jersey report mentioned above showed that winter-reared pullets did not lay as many eggs as April started pullets. Perhaps that answers all the questions in the Cornell report or perhaps one test is not sufficient.

**June Chicks Least Profitable.** About this time each year some people decide that they made a mistake in not starting chicks, and that it still is not too late. They are probably correct this year. Of course they will not make a big income. Their eggs will go on a falling market, but they will get plenty of eggs and there will be practically no danger of a winter molt.

One big disadvantage, generally overlooked, is that about half the eggs will be mediums.

# Wonderful Success Raising Baby Chicks

Mrs. Rhoades' letter will be of utmost interest to poultry raisers. Read her experience: "Dear Sir: I think I must be one of the very first to use Walko Tablets. Some 35 years ago when I started raising chicks I saw Walko Tablets advertised as an aid in preventing the spread of disease through contaminated drinking water. I tried a package for my baby chicks with happiest results. I have depended upon Walko Tablets ever since." Mrs. Ethel Rhoades, Shenandoah, Iowa.

# Danger of Disease Among Baby Chicks

Readers are warned to exercise every sanitary precaution and beware of infection in the drinking water. Baby chicks must have a generous supply of pure water. Drinking vessels harbor germs. Drinking water often becomes infected with disease germs and may spread disease through your flock before you are aware. Use preventive methods — use Walko Tablets. For over forty years thousands of poultry raisers have depended upon them. You, too, can rely on Walko Tablets as a valuable antiseptic to aid in preventing the spread of disease through contaminated drinking water.

# You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Use them in the drinking water to aid in preventing the spread of disease through contaminated water. Satisfy yourself as have thousands of others who depend upon Walko Tablets year after year in raising their baby chicks. You buy Walko Tablets at our risk. We guarantee to refund your money promptly if you are not entirely satisfied with results. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct post-paid if your dealer cannot supply you. Price 60c, \$1.20, \$2.50 and \$4.00.

**Walker Remedy Co. Waterloo, Iowa**

# Rich Poultry Farms

By J. F. "Doc" ROBERTS

THE PRESIDENT of Massey-Harris (farm implements) says that in 1939 their average payroll was 60c an hour; now it is \$1.90 an hour. Meat hasn't gone up that much!

Pork, the so-called "poor man's meat" is cheap at 50c a pound or less, except for loin chops and ham. Lamb is almost off the market because of past price control bungling. Veal is not out of line, and beef is plentiful but high. There is no shortage of meat in total supply.

So—what happens? Since the public wants beef and has pushed its price up so high by ability to pay for it, our politicians come out with orders setting back the price of live cattle. Then they tell the cattle producers that on August 1 they will set it back again and on October 1 will set it back again. They boast about saving the public 700 million dollars, instead of saying they are taking 700 million dollars, besides all our expenses, away from beef cattle producers and dairymen.

Any schoolboy could answer that one with the prediction of less cattle production and black markets. He knows that cutting the price and shortening up the supply of beef means only one thing—black markets. This boy might also ask if it would not be smarter to try to increase cattle production rather than deliberately (even brazenly) tell cattle producers that they will get less and less for any animals they have as the months go on.

That is not all. If anyone wanted to create black markets, ration books and all that go with them, they would restrict licensed packers from killing as many cattle as they have been. So that is what they have done. Beginning May 20, no legal packer can kill over 90% of as many cattle as formerly. These are called quotas. That is unbelievable, isn't it? Yet that is the order from the Mayor of Toledo, now in Washington.

Cattle marketings increased about 25% over the country this past week. They will probably continue to increase for awhile to get in before the "promised" lower prices. Then they will disappear and the black market will be on. Ration books will be next in order to control the consumer as well as the beef producer and the packer, and the entire food industry will be completely under control by bureaucrats.

This is sure, unless we as Americans "rear up." Where it will end depends entirely upon whether you do "rear up" or not.

\* \* \*

There seems to be a sequel to what was said here in regard to the young man requiring assistance to start farming today. A number have spoken to me about the position of the farmer or today. The farmer may eventually want to retire, sell out, and move to the village, as so many were able to do up to a decade ago. But now he finds the little place in the village is bringing about as much as his farm; secondly, the money he has saved for his retirement has so depreciated in value (and may continue to do so) that it would not be enough to support him and pay bare living expenses; thirdly, the income tax would take a big slice of the sale price of his farm.

Therefore, the sequel to the farm boy needing help is that the old farmer needs the help of the young farm boy. If the young man can work the old farm on shares or some such agreement, then perhaps they can both live there, and eventually the young man

can own the farm and thus maintain the farm community and the backbone of our country, "the family farm."

—A.A.—

## HEREFORD SALE AVERAGES \$890.00

At the annual sale of the New York Hereford Breeders' Association held at the Cornell pavilion on Saturday, May 5, forty-two Herefords sold for \$37,400. This was an average of approximately \$890.00 a head, \$292.00 better than the average of last year.

The top heifer brought \$2000.00. She was consigned by the Crissenger Stock Farm of Rubeck, Pa. and was bought by Leon Kocher of Millersburg, Pa. The top bull was consigned by Southern Acres Farm of Shelburne, Vt. Walter Breuss of Claverack, N. Y. bought him for \$1650.00.

There was an excellent crowd at the auction and bidding was brisk.

—A.A.—

If you plan to show your cattle at fairs, check early to see that registration papers are in shape.

## EASTERN NEW YORK DISPERSAL SHELDON FARMS NOTED HERD

SAT., MAY 26

### 70 Registered Holstein Cattle

T. B. Accredited, Bang Certified, calf-hood vaccinated, eligible for shipment into any State.

HILLSDALE, COLUMBIA CO., N. Y.  
4 miles east—just off Route 23; 12 miles west of Gt. Barrington, 18 miles east of Hudson.

### OFFICIAL HERD TEST AVERAGE —

490 lb. fat, 13,251 lb. milk, 3.7%, 2x. Herd rich in ORMSBY SENSATION 45th breeding. Daughters of 825 lb., 4%, 2x dam selling, 11 cows with 520 lb. to 694 lb. fat.

Many fresh and close springers, A large number due in fall, 25 Bred and Open Heifers, 4 Bulls.

PROVEN BY BREEDING—BY PRODUCTION—BY TEST—IT IS ONE OF NEW YORK STATE'S OUTSTANDING HERDS.

Sale in big tent, starting at 11:00 A.M.

## NEW JUST OUT...

VOLUME IV

## NYABC Sire Pedigrees

228 pages, 280 up-to-date records of bulls of all five dairy breeds that have served members' herds in artificial breeding in New York and in Western Vermont. Many other valuable dairy facts. All in sturdy, green, gold-stamped loose-leaf binder; easy to add new pedigrees from your Cooperator. A bargain at \$1.00 from your NYABC inseminator.

Box 528 A Inc. Ithaca, N. Y.

## New Hampshire Jerseys DISPERSAL SALE

Gabriel Elder of Etna, N. H. (near Hanover) sells at the farm

Wednesday, June 13th, 1951 at 1 P.M. DST  
HIS HERD OF 37 HEAD

A top herd with production records on every animal in milk. The 1950 average was 424 lbs. fat for 20 head. They are in top condition swinging wonderful udders and carry plenty of size as well as type and outstanding pedigrees. The Sr. herd sire is a son of Brampton Royal Basil, Ex. & Sup. Sire. The Jr. herd sire is a son of Juggler's Tycoon (Sup. Sire) and 2x Ton of Gold cow. There are daughters of Tested Sires, Tested Dams, Gold Medal cows. A previous herd sire was half brother to Sibley Farm's Nat'l. record cow, Lex Deborah. Some of the animals have records on this hill farm of 11,000 milk and close to 600 fat. A small herd but outstanding in every way. Send to sales manager for a catalog now.

## Stonecliff Farm Dispersal Sale

SATURDAY, May 26th, at 1:00 o'clock

LOCATED: ROUTE 5, 2 Miles North of Bradford, Vermont.

### FARM MACHINERY 1948 Ford (F-5) Truck 11,000 miles; 1943 Chevrolet

Army Truck, 4 wheel drive; 1949 International "H" tractor; 1944 International "H" tractor; 1948 Super-Six Loader with shovel, bulldozer & snowplow; 1949 Gehl Field Chopper with hay and corn attachments; Gehl Auger Blower with pipe; McCormick-Deering No. 8 Genius 2 16 in. bottom plows; McCormick-Deering 8 ft. Disk Harrow, Spike tooth Harrow, Spring Tooth Harrow; McCormick-Deering 25-V Trailer mower with 7 ft. cutter bar; McCormick-Deering No. 200 Manure Spreader (new 1951); McCormick-Deering tractor mounted Cultivator; McCormick-Deering Two row, check row Corn Planter; McCormick-Deering Dump-rake; Judson side-delivery rake; Judson Lime & fertilizer spreader; M. W. Cement Mixer; Bell Aircraft Prime Mover, (3 HP) Power wheelbarrow 1/2 Ton; Marquette Farm Welder 20-180 amps; Farmall A Tractor with plow and cultivator; F14 on rubber with Hydraulic lift; McCormick-Deering Corn Blower; Complete Milking Machine Equipment.

WOOD WORKING TOOLS WALKER-TURNER 1 H.P. Radial Saw with base, Walker-Turner 6-in. Jointer-Planer with base M. W. Jig Saw on base & numerous small tools.

DAIRY BOTTLING EQUIPMENT 1 20 HP ORR & SEMBOWER STEAM GENERATOR, 1 brine freezer, 1 M. W. "800" Cream Separator, 1 M. W. Churn, Milk cans and pails.

Mr. Lomontagne of Bradford has taken over the Dodge Agency and has consigned to this Sale his NEW MOLINE UNITS consisting of 2 R Moline tractors, 1 U Moline tractor, and 5 (4) bar side-delivery rakes.

Owner: WARREN CUMMINGS, Bradford, Vermont

C. W. GRAY, Auctioneer, E. Thetford, Vermont

# How To Make BREAD

## INGREDIENTS

Yield: 2 loaves

- 2 cups milk, scalded and cooled to lukewarm
- 1 yeast cake, or less
- 2 teaspoons salt
- 2 tablespoons sugar
- 2 tablespoons fat, melted
- 6 cups OR LESS bread flour, sifted

By Lillian Shaben

New York State College of Home Economics

**T**HERE are three basic differences in this bread recipe. First, less flour is used; for by using bread flour, less is needed, and the result is a less solid and heavy loaf. It's the gluten in very good bread flour which enables you to use less flour and still get a nicely rounded loaf. Sift it before measuring, and don't pack it down in the measuring cup, as a cup of packed flour may equal one and one-third cups of sifted flour.

Second, the method of mixing is different. The melted fat is added *after* half the flour has been beaten in. This prevents the flour from getting fat soaked and losing some of its ability to absorb liquid. Also, before kneading the dough on the bread board, it is worked *in the bread bowl*. This way, less flour is worked into it.

Third, the method of baking is different, making it easy to get good results with any type of range. Since everyone does not use the same kind of oven, it is important to know what happens to the bread during each quarter of the baking time, and adjust your oven accordingly.

All measurements are level. If one cake of yeast is used, the bread may be mixed and baked in about 4 hours. The same amount of yeast will do for 4 loaves, but rising time will be about twice as long. The amounts of sugar and salt may be increased if your family likes it better that way.

**1.** Add the yeast, sugar and salt to the milk which has been scalded and cooled to lukewarm. (If granular yeast is used, soften it in  $\frac{1}{4}$  cup lukewarm water, and use only  $1\frac{1}{4}$  cups milk.) When yeast has softened, add about half of the sifted flour. Stir batter to mix, then beat thoroughly. Add the melted fat, and beat until well mixed. Then add remainder of flour, but watch the sixth cup and use as little of it as possible. Save at least  $\frac{1}{2}$  cup of it for flouring the board. Beat batter thoroughly to get lumps out.

**2.** Work the dough in the bowl, using a breadmixer or your hand. (For more than six loaves, you may need both hands.) Grab the dough with hand, twist and pull up. Repeat until dough comes away from bowl in a rough ball (see picture No. 2). Turn dough onto floured board or pastry cloth. Scrape bowl and mixing spoon free of dough, and get that bowl as "clean as wax" either with a spatula or the floured tips of the fingers.

**3.** Knead the dough lightly, just enough to form it into a smooth, compact ball. Less kneading is required at this point because it has been well worked in the bowl. Fold dough toward you, then push away lightly with the "heels" of your palms. Repeat, giving the dough a quarter turn each time, until bubbles are out. Add flour as needed, but *as little as possible*. Don't break the "skin" of ball of dough.

Grease bowl and place ball of dough in it. Brush lightly with melted shortening. Cover with greased plate or metal cover (easier to clean than towel if dough sticks to it) and set in warm place (80 to 85°F.), free from drafts,

and let rise until doubled in bulk. It will take from 1 to  $1\frac{1}{2}$  hours.

**4.** Punch down, fold under, and let rise again until doubled (about 45 minutes to 1 hr.). Then punch down again, turn on board, and knead lightly.

**5.** Divide ball of dough into two parts.

**6.** Flour hands and flatten one ball of dough into an oblong about the length of your bread pan, and about 1 inch thick.

**7.** Fold dough lengthwise and seal edges.

**8.** Roll and gently stretch the dough lengthwise, easing it out with fingers, but don't break the grain.

**9.** Fold both ends of stretched dough toward center so that they overlap. Seal edges, and flatten out again as in step No. 6.

**10.** Fold into thirds.

**11.** Seal edges, pressing down firmly with your hand or fingers so edges will remain in place. If necessary, roll the loaf slightly to insure uniform height from end to end. Place loaf, sealed edge on bottom, in greased bread pan. Dough should fill slightly more than half the pan. Do not grease loaf, as it may result in speckled crust.

**12.** Let rise in warm, but not hot place until doubled in bulk (half hour or more). While loaves are rising, heat gas or electric or oil oven to 415° F. (Keep coal or wood range ovens about 20 degrees cooler than baking temperatures given below, as they are usually drier.)

**13.** Place loaves in oven which has been pre-heated to 415° F. Do not let pans touch each other, or oven walls. Write down time loaves go into oven and time they should come out. Allow 45 to 55 minutes baking time, and divide it into quarters:

**1st Quarter:** Bread finishes rising and starts browning. After 5 or 6 minutes, turn the loaves, end for end.

**2nd Quarter:** Lower heat to 375° F. for the remainder of baking time. Bread continues to brown in second quarter.

**3rd Quarter:** Bread finishes browning.

**4th Quarter:** Bread finishes baking inside and shrinks from sides of pan. It should not brown any more, or crust will be too thick and hard. If it continues to brown, open oven door for one or two minutes and lower temperature to 350° F. to finish baking.

**14.** When baked, turn bread out on wire cooling rack. *Do not cover.* Do not put in bread box until cold. Loaves may be buttered when they come out of the oven, but this may result in a crackled crust.

(EDITOR'S NOTE: To get Miss Shaben's recipes for other breads made at Home Bureau training school described in April 7 issue, write Mrs. Mabel Hebel, AMERICAN AGRICULTURIST, Box 367, Ithaca, N. Y., and enclose 10 cents. Recipes include: Whole Wheat, Plain Rye, Golden Corn Loaf, Oatmeal, Oatmeal-Whole Wheat, Holiday Rye, Potato, Salt Rising.)

# Pick Your Cottons

No. **2390**. Stripes strike out in all directions to proclaim daughter's favorite cotton cooler. She'll love the roomy patch pockets! Sizes 6-14. Size 8, 2½ yds. 35-in. fabric, with 2 yds. ric rac trimming.

No. **2391**. Women, too, recognize the advantage of the cleverly placed stripes, the crisp, clean-cut lines in this practically sleeveless style. Sizes 12-20, 36-40. Size 16, 3½ yds. 35-in. fabric, with 2½ yds. ric rac.

No. **2438**. Another smart striped success! Two hidden pleats break from the front of each pocket for greater walk-

ease without added bulk. Sizes 12-20, 36-46. Size 18 takes 4¾ yds. 35-in. material.

No. **3034**. Town-country double duty duet. Full-skirted sundress takes touches of white at the front flaps and jacket's collar. Sizes 12-20, 36-42. Size 18, 4¾ yds. 35-in., with ¾ yd. 35-in. contrasting.

**TO ORDER:** Write name, address, pattern size and number clearly. Enclose 25 cents for each pattern wanted. Send to **AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.**

## Please Tell Me...

By Kathleen Berresford, Nutritionist

We have prune juice for breakfast every morning, but someone told me this doesn't have any vitamin C in it. Would it be better to have orange juice?

Orange juice is one of the best sources of vitamin C, while prune juice contains none of this vitamin. Perhaps you would be interested to see how some of the other juices compare with orange juice as a source of vitamin C. To get the same amount of vitamin C that you would get in a glass of orange juice, you would need to drink

- 1 glass grapefruit juice
- 3 glasses tomato juice
- 5 glasses pineapple juice
- 20 glasses grape juice
- 40 glasses apple juice (unless vitamin C has been added)

\* \* \*

Most of my friends give their babies formula instead of nursing them. Is this as good as mothers' milk?

This is a question doctors do not agree on. When a mother is not able to nurse her baby, a formula can be prepared which is very similar to mothers' milk. Studies have shown, however, that babies who are nursed are less likely to get certain illnesses

in the first few months of their lives than those given formula. Also a breast-fed baby gets more of that very important ingredient called love, because his mother can't prop the bottle up and go off and leave him alone.

## SEW AND SAVE!

Our Spring-Summer Fashion Book brings you 135 attractive pattern designs for all ages and occasions. It features: cap-sleeved cottons; sunbacks and boleros; the basic dress with changeable accessories; lovely blouses; trousseau needs; date and party clothes; vacation tags; home frocks and aprons; girls' and children's pretty frocks and play clothes. To get a copy, send 25 cents in coin to **AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42 Station O, New York 11, N. Y.**

LOOK YEARS AHEAD... and buy a

# Speed Queen

the washer that saves repair bill worries

DOUBLE WALLS  
to keep water hot

Now, more than ever, it pays to look ahead in buying a washer. What about upkeep cost? How much hot water and soap will it use? Will there be expensive repair bills? How about life of service?

Your Speed Queen dealer can give you very satisfying answers to the above questions... and convince you that a Speed Queen is your wisest choice. Write the Speed Queen Corp., Ripon, Wis., for a free copy of a very informative booklet entitled "Speeding Up Your Home Laundry."

I have used a Speed Queen washer for 12 years and it is my pride and joy. It washes my clothes perfectly clean and the water remains hot through the last tubful. It has never given me any trouble mechanically or otherwise. Your advertising is perfectly true otherwise. — "Bowl-tub. Double-Wall Speed Queen Washers wash clothes clean in half the time." **MRS. OLIVE B. MUELLER**  
Lincoln, Nebraska

I want you to know that I am the proud possessor of a Speed Queen washing machine—have been for 12 years now, and it is still going strong. I give it the highest praise for its good performance and dependability.

**MRS. T. HOPELY**  
Willow Grove, Penn.

## No Need To Dig Up & Clean Out SEPTIC TANKS & CESSPOOLS

Now you can make your waste disposal system as efficient as big city disposal systems. One pound of new, patented Septifeed—used just 4 times a year—does the trick. Guaranteed. Eliminates need for costly, unhealthy digging up and pumping out of your disposal unit—or your money back. Exclusive non-chemical, non-poisonous, non-explosive ingredient keeps Septic Tanks & Cesspools in FULL BACTERIAL GROWTH at all times. Users swear by it. Get year's supply of four 1 lb. packages today. Send check or money order for \$4.80 to The Septifeed Corporation, Chambersburg 1, Pa. Note: Dealer inquiries invited.

# STENCILING FURNITURE

**R**ECENTLY I stayed over night in a big old cupolaed mansion where the "Guests" sign swung in the wind under huge eaves. Inside, the bright lights and cheery colors were no warmer than the welcome given by the young hostess who had just "taken over" the old mansion. I had stayed there in bygone days, and I noticed a freshening and a sparkle the place did not have before.

Breakfast next morning was served on a mahogany table in the diningroom, where rejuvenation was also evident. While waiting for coffee I noticed some Hitchcock chairs in all their glory of old-time bronze stenciling. I asked the landlady if she had done them herself, which she modestly denied. She had had them refinished by an old craftsman, she told me, who made a specialty of that sort of thing. She said she had been collecting the chairs, one by one, for a long time and had taken them to him for redecorating in the original manner.

I thought she might have done them herself since so many women are doing that very thing. It's not only a fascinating hobby, but the early American stenciling blends well with many contemporary furnishings. Interest in this art has been further stimulated recently by the publication of a number of fine books. Some are huge volumes of historical research; others are simple, how-to-do-it handbooks.

## Early American Stencil Decorations

Century House of Watkins Glen, New York, has published a handsome volume entitled *EARLY AMERICAN STENCIL DECORATIONS*, by Janet Waring. (\$10.00). This book is a reissue of Miss Waring's *EARLY AMERICAN STENCILS ON WALLS AND FURNITURE*, and is one of two large and authentic treatises on the historic origin and techniques of stenciling as practised by our forefathers. Miss Waring's book goes back to the origin of designs and the origin of stenciling itself and gives an account of its use in the Orient, ancient Greece and other European countries. She tells the story of wallpaper, and of the traveling paperhanger and painter who was also a stenciler, sometimes the latter only.

The first part of the book deals with the treatment of walls, and the second part with furniture. Chairs, pianos, trays, and many other pieces were decorated with flowers, fruit and birds. Some were carefully stenciled in several colors, and sometimes with free-hand brush strokes, too.

## Pure Gold Powder

Miss Waring tells about a visit to the last of the stencilers, George Lord of Portland, Maine, in the 87th year of his life. He was supposed to have decorated chairs from his fifteenth year, and he could remember when pure gold powder at \$16 per ounce was used on the best chairs. New York, being the center of trade and the chief port of import from the Barbados and Indies, from whence came the best mahogany, soon became the center for the best pianos, which too were stenciled. Sometimes the name of the maker was used alone in fine "German script," and sometimes

By DOROTHY WELTY THOMAS

it was accompanied by a bit of good ornament.

The craftsmen who did such work on pianos and other furniture were known as gilders, painters, japanners and fancy chairmakers. Finally, Lambert Hitchcock started a chair factory at Hitchcockville, Connecticut; and because he believed thoroughly in advertising as well as in making good chairs, his name outlived all the rest and became almost synonymous for early American decorated chairs, although there were many other makers and he himself made many kinds and later was agent for many he didn't make.

The book also contains directions for decorating furniture and other items, with permission to photograph patterns printed in the book. Excellent photographs show various applications of the decorations. There are also examples of wall stencil designs reproduced in color on wallpaper by R. E. Thibaut, Inc., of New York City. Miss Waring's work is essentially an historical treatise and would be a valuable addition to anybody's library, especially those seriously interested in the art of stenciling.

Only three years after Miss Waring's first edition was published, another

handsome and elaborate piece of work, *EARLY AMERICAN DECORATION*, was brought forth by Mrs. Esther Stevens Brazer. This was soon out of print, but after her death two editions were published and a new memorial edition is now available through Clarence W. Brazer of Flushing, New York (\$16.50). This book probably stands alone as giving the most authentic, detailed information about the designs themselves and the technique of decorating early American furniture, walls, and tinware. It is also profusely illustrated in color and with photographs, and gives a brief historic background of the use of color and ornament in homes and furnishings.

## Studied Old Instruction Book

Mrs. Brazer made a minute study of the designs and of an old instruction book. She hastened to study the old fast-fading examples for the benefit of other craftsmen who "wish to restore and rescue old work from oblivion." Sixteen chapters of technical information precede the part which deals with history and people. Housewives of earlier days, she says, had a keen interest in beautifying their homes but

they didn't delve into the mysteries of stenciling furniture, trays, etc., until after the Revolution. She credits one Angelica Kaufman as the first woman to do it extensively, and it was still later before women entered factories and applied their dainty fingers to the task of making beautiful the rocking chairs and canisters of their time.

The whole volume stresses technique, as therein seems to lie the secret of authentic revival of the old art. "Notes from a Treatise by Thomas Sheraton published in 1830 and called *The Cabinet Maker's Dictionary*" is a feature of the book.

## How To Stencil Chairs

For those who wish to "be up and doing" rather than dwell on the facts of yesterday, there are several short how-to-do-it books available. Miss Florence Wright, Associate Professor at the New York State College of Home Economics and widely known to Extension groups in the state, has written and is the publisher of an excellent handbook entitled *HOW TO STENCIL CHAIRS* (\$1.00). You can get a copy of the book by writing to Miss Florence Wright, P.O. Box 393, Ithaca, N. Y., and enclosing \$1.05 (the 5 cents is for postage).

Miss Wright's book is illustrated by photographs and drawings and is being used by Home Demonstration and other adult education groups in New York State as a textbook. The drawings tell explicitly how to do the work, even down to setting the clamps on an old chair when re-gluing it, and how to wrap the velvet around your finger in the bronzing process. There are patterns and detailed instructions from start to finish on how to proceed to make an old chair like new in the authentic manner.

Since the publication of this book, the author has published 20 stencil

(Continued on Opposite Page)

# DEAR CITY COUSINS - - -

**F**ARMERS in the Northeast need the good will of consumers. They do not have it now. Most of the ill will toward farmers is the result of misinformation or lack of information, but getting the facts to consumers is your job. No one will do it for you.

Here and there, in a small way, something is being done by farmers to correct this situation. For example, there is a recent venture by GLF whereby they sponsor the Symphony Hall Musical Program every Wednesday evening. The program originates over Radio Station WQXR in New York City and is carried by the 14 FM stations of the Rural Radio Network. The time is 8:05 until 9 each Wednesday evening.

Midway in the program, which incidentally has attracted a large city audience, there is a 3-minute talk directed toward giving consumers a sympathetic appreciation of farm problems.

Just imagine that you are a city consumer who, in your youth, had spent happy summers on Grandpa's farm. You would listen to the following talk which was given by Merrill Knapp on April 4 with pleasant memories and, after you had heard it, you would have a better appreciation of some of the problems which plague farmers. Here is the talk:

**S**PRING by the calendar arrived two weeks ago and spring farm work is well advanced in New Jersey and on

Long Island. But farm families in upstate New York will have to content themselves for a little with signs of spring. And signs there are, a-plenty. One infallible sign of spring is the baby chicks. Baby chicks are important on Northeast farms—a major enterprise on many. Few farmers hatch their own any more. They get them from commercial hatcheries, who make a business of breeding and hatching chicks that will grow into steady egg producers.

Any day now, on almost any farm in New York, New Jersey or Pennsylvania, the hatchery truck will deliver a box of 100—or 500 or even several thousand—fuzzy, yellow, peeping, day-old chicks. It's always a great day on the farm when the chicks come. The kids love them. Even Dad and Mother can't resist their appeal, though they mean a lot of work ahead.

It will be six months before the chicks will grow up—six months before they will begin to lay eggs to pay for their keep. In the meantime they must be fed and cared for. Right off that means a good clean house, with a coal or oil or electric stove to take the place of the mother hen in keeping the chicks warm. It means water and carefully prepared feed. It may mean medicines or vaccines if the chicks get sick.

Gradually the chicks will grow. By next fall they will be ready to take their place in the egg production line,

producing eggs for the people of New York, Scranton, Poughkeepsie, Elmira, Paterson—and hundreds of other villages, cities and towns.

Eggs are big business to Northeast farmers. They are also risky business. No other farm product varies so much in price. Eggs are awfully good when they are fresh, and awful when they're not. So when they come to market they have to be sold right away or else put into cold storage. When the weather is mild and the hens are laying well, lots of eggs come to market. In a severe cold snap, hens don't lay so well. Then there is a smaller supply. Or it might be cut down by a transportation tie-up like the rail strike a few months ago. If you get a short supply along with a heavy demand—like Christmas, Easter or Passover—prices go up. If you get a good supply when demand is slack, prices tumble. On the biggest eastern market last year, prices paid to farmers for large white eggs in case lots ran as high as 78c, as low as 33c.

These are extremes. If the average price is reasonable, farmers do all right and so do consumers.

Right now, egg prices are bringing the average egg producer a fair return for his labor, investment, and feed costs. And eggs, although high by 1939 standards, are a good food buy—one of the best in food value per dollar.

Your neighbors, the farm people of the Northeast, commend them to you.

## Today in Aunt Janet's Garden

### Spring Satisfies?

As spring progresses and I watch to see how our shrubs and perennials came through the winter, I can only express great satisfaction — on the whole. The old plantings of bulbs are flowering profusely, and the new ones keep me running out to see if they are all that the catalogs promised!

Two new daffodils especially interested me: Rosabella, a new "pink," derived from the old "pink" Mrs. R. O. Backhouse and quite similar to it; and Semper Avanti, large late and very showy daffodil of creamy yellow with shallow fluted cup of bright orange. Red Emperor tulip has again dominated the rock garden with its fine large bright red blossoms, while the late white cluster daffodils Thalia and Cheerfulness hold the season a little longer.

Shrub pruning is finished except for lilacs and May-flowering viburnums, which get theirs after blooming, and the arbor vitae hedge which is done in June or July. Flower buds are abundant on all the flowering shrubs, and we should have a fine show later on. The one heartbreak has come because some burrowing animal undermined our best pink azalea, with the result that the whole center had to be cut out. We only hope that enough of it survives to prevent an ugly hole in the planting.

We finally removed the dwarf mock-orange Avalanche which did not add anything to the beauty of the place. Its

close crowding of spindly branches and sparse flowering made us willing to let it go.

### Color in the Borders

Flowering pansies are already set in front of the bulbs to carry on the color in the borders. Later on petunias, marigolds and zinnias will be set behind and between the bulbs to help hide their dying foliage and to provide summer bloom.

The colcus, geranium and larger begonias in the window are being broken apart to furnish cuttings, some

### GOD'S WAYS ARE BETTER

By Elaine V. Emans

God's ways are better than we could have planned

To bring about fulfillment of our dreams;  
And though we cannot always understand  
The strange delay, the circumstance that seems

To be a greater obstacle than ever,  
We learn, at last, the happy ending must  
Follow upon the hope that wavers never;  
Follow the lead of our implicit trust.

for the pots on the porch, others for selected spots in the border. The umbrella plant takes its place in the pool.

Tuberous begonias are started, waiting for soil to warm up before being planted outside. Chrysanthemums — those that survived the cleaning out of chickweed from the borders — look thrifty. I am glad that some of the free-spreading kinds, like white Mary Pickford, can be used at the Garden Club's plant sale. All that one needs to start a big plant is one of the vigorous shoots around the edge. The woody center of the plant can be discarded.

### Learning the Hard Way

One mistake which proved that we ought to take the advice of good gardeners was demonstrated when one of my bleeding-hearts did not come up this spring. I knew that they do not like crowding, but could not resist setting in a summer-flowering plant nearby to try to hide the blank space caused by the dying down of the bleeding heart. Again I have had to learn the hard way!

One of my heart-warming early spring flowers is the primula, sometimes called primrose. I grew some from seed about 15 years ago and still have some of the subdivisions. The florets are large, dark red with yellow centers and edging. Present day offerings of primula seeds or plants are even bigger and better. I have found them highly satisfactory planted among the bulbs; the darker colors do not seem to multiply as fast as the commoner yellow varieties. All appreciate a little shade.

The new lilies and some of the old ones are still asleep (in late April). I hope they don't forget to wake up! Some of them did forget last year.

— A. A. —

### FOR GOOD ACHIEVEMENT

At our house we keep a bonus pot, which is in reality an old bean pot. Each week I put a small sum of money in it to be given as a bonus to the child whose record is best. In order to win this bonus he must not have had to be reminded to do his chores, pick up his toys, hang up his clothes. He must be prompt in carrying out any of the other responsibilities which are his. When they receive this bonus for good achievement it is surprising how hard they work for it.—B. C.

## Stenciling Furniture - - -

(Continued from Opposite Page)

patterns for furniture — for rockers, straight chairs (both early and late), and clocks. Prices for these patterns range from 50 cents to \$1.50, depending on how complex the pattern is. A price list complete with illustrations of the patterns may be obtained by writing to Box 393, Ithaca, N. Y.

Trays are even more specialized than chairs, because they require a combination of stenciling and free-hand painting. Miss Wright is planning a similar book on the stenciling of trays, using authentic patterns and methods of the old craftsmen, but it will not be published for at least another year.

### The Most Pleasing Manner

HOW TO PAINT TRAYS by Roberta Ray Blanchard, published by Charles T. Branford Co., Boston, Mass. (\$3.00), would be helpful to many persons who are interested in doing trays. This author belongs to the school of thought that believes that one may take some freedom in decorating and not be held strictly to copying old designs. She tells you to fill the space in the "most pleasing manner." Her book has many illustrations, patterns, and clearly written instructions.

In a day when expressing oneself is being stressed, a great many may want to depart from the time-honored examples. There is nothing new under the sun, but if you want to decorate furniture and care not a hoot how great-grandfather's chair looked, nor what kind of brushes or palettes he used, you may be inspired by PETER

HUNT'S WORKBOOK, published by Prentice-Hall, New York City (\$4.50). Much of the material in this book is derived from Scandinavian and Pennsylvania Dutch decoration, but more of it is pure imagination, and therein lies its charm.

### Painting For Fun

Mr. Hunt believes in painting for the sheer fun of it, and in his shop in Provincetown, Mass., you can wander around on a summer day and imagine that you are in fairyland. Nothing gives him pause. He would just as soon paint peacocks on a piano or a mouse in your cupboard as stripes on the rung of a chair. Everything from merry-go-round horses to salt and pepper shakers get his brush strokes. And color! He really "goes to town" there.

Over in Norway and Sweden, where the winter nights are long, they paint chairs and chests and this and that, and the work is called "pride work" instead of art work. Mr. Hunt's only rule, if indeed he has any, is to take pride in doing well what you do, and paint to please yourself and for the fun of it. His ideas are more geographic than historic, for he cites examples from Italy and Mexico and blends them all in his inimitable way.

For sheer whimsy and fun this book would be a good starter for a hobby. It tells how to do the simple brush strokes in language a child could understand. The pages are colorful, full of photographs and ideas. It is the ideas that sell the book.

"I'm glad I tried this New Dry Yeast because it's so much faster and easier"

## Homer Farm Wife Wins 21 Prizes At State Fair Cooking Competitions

Counting Mom's ribbons is a favorite indoor sport with David and Richard Smith—and their mother, Mrs. Chester Smith has plenty of ribbons to count. Twenty-one prizes in all went to Mrs. Chester Smith for her culinary skill at the 1950 New York State Fair!

A Fleischmann's Yeast user for many years, Mrs. Smith says, "I'm mighty glad I tried Fleischmann's New Improved Active Dry Yeast. It's so much

faster and easier than any other."

When you bake at home—use yeast. The delicious goodness and wholesome nourishment of yeast-raised treats make them a top family favorite. And when you use yeast—use the best—Fleischmann's New Improved Active Dry Yeast. It's easier to use, faster working. When you bake at home—treat your family to delicious, nutritious yeast-raised goodies.

EMBROIDER DESIGNS: Pattern No. E-534 is a hot iron transfer which contains rose sprays, bluebirds, Colonial figures, etc., suitable for embroidering pillow cases, scarves, and towels. Send fifteen cents for complete instructions to Embroidery Dept., AMERICAN AGRICULTURIST, 10 North Cherry St., Poughkeepsie, N. Y. For a copy of our Needlework Book, add 15 cents in coin.

# WHAT'S GONE BEFORE

Immediately after his marriage to Ann Clinton, Mark Wilson leaves to join Lincoln's volunteers. His brother, Charlie, and his father, George Wilson, follow him into the army; also Ann's father, Fred Clinton. When Mark becomes involved with the entry into the Union lines of a southern spy, his mother and Ann journey to Washington to see Lincoln. They obtain a pardon and have a glad reunion there with their men. Soon after Ann and Nancy's return from Washington, Mark and Charlie come home on furlough. Mark resents the fact that Henry Bain, a neighboring farmer who holds the mortgage on the Clinton farm, makes frequent visits to the Clinton home. A talk between Mark and Ann about the question of allowing Henry Bain to take over the farm for the mortgage ends in a quarrel, and Mark leaves the next morning to rejoin the army without saying goodbye to his wife.

## CHAPTER XIX

**B**OOTH Mark and Charlie Wilson re-joined the Army at Fredericksburg on the north side of the Rappahannock after its return from the long trip to Maryland where it had checked and defeated Lee at Sharpsburg or Antietam in his attempt to invade the North. But now the boys were separated, as Charlie had enlisted in the cavalry and Mark had rejoined the infantry.

It was late November, cold, with occasional flurries of snow, and the veterans, tired from their long march to Maryland and back, were in a dark, complaining mood. Their uniforms were worn and inadequate. Some of the men were almost barefoot. The field hospitals were full of the sick, and, worst of all, the men were hungry all of the time because of the poor rations. The hard-tack, the poor coffee, and the salt pork seemed all the worse to Mark in comparison with the good food that he had just had at home.

On the long journey back to the Army Mark had had plenty of time to realize that far worse than any physical inconvenience or suffering was mental anguish, and that the worst kind of mental suffering lies in the ashes of regret. Time and again bitterly did he curse the pride and jealousy that had caused him to leave his wife without even saying goodbye. Having once made the decision and re-enlisted, there could be no turning back. He was in the Army, and there was a war on, and he would have no opportunity, perhaps for years, and maybe never, to put his arms around his girl and tell her how sorry he was.

As he dozed on the train trying to sleep, his wife's last words rang repeatedly in his ears: "It's you I love!" she had said. "It's you I love!" He tormented himself with the bitter thought that he had flouted the most precious possession a man can ever have when he walked away from his wife and back into the Army.

To be sure, he could write letters, but how could he make Ann know with mere inadequate words how sorry he was, and what a fool he knew he had been? Nevertheless, he must try to write, for now it was his only way to straighten out the mess he had made of his married life and to ease the heartache of his girl, whom he had hurt so terribly. Soon after boarding the train he had begun his letter to Ann. Using the stub of an old lead pencil, he

started to pour out his heart on paper. Again and again he tried, but each time he tore up what he had written because he just couldn't say what he felt. When he did get a few words that seemed at least partly right, the jiggling and jarring of the train made them so illegible that he doubted if Ann could make them out.

Finally, in the boarding house in Washington where Mark had got a cheap room for the night he managed to finish his letter, and out of the travail of his heart he wrote better than he knew:

"My darling Ann:

This is to ask you to forgive me, though I wouldn't blame you if you didn't. How I could ever have acted the way I did and left you without saying goodbye is more than I am able to figure out though I have thought of nothing else since I left you. This is not an excuse, but maybe you can find it in your heart to forgive because I was so worried and troubled about you and saving your home, so torn between my desire to protect and care for you and the feeling that it was my duty to rejoin the Army that I couldn't think straight. I never was so mixed up in my entire life. Now in all my loneliness, confusion, and despair there is just one thing I am sure of—I love you, dear, and come what may, I always shall.

"On the way down here I thought of all the other boys who have left their homes, their fathers and mothers, maybe their wives, to do their part in this war, and I kept thinking that if all those others could stand it, I surely

ought to be able to do so. Then would come the despairing thought that they had left their homes and loved ones with no quarrels or misunderstandings, while I had left you, the person dearest to me in all the world, without even a goodbye.

"If you can find it in your heart to forgive me, I think I have had my lesson, and if God gives me the privilege of coming back to you some time I'll try to make up for all the trouble I've caused you. The only way I can get to sleep is to offer a little prayer for us both and to say over and over to myself, 'Goodnight, Ann, darling, I love you.'

"Please write to me, dearest. I can't bear to go on living unless I know you have forgiven me.

"With all my love,

Mark."

\* \* \*

When Ann had gone back to the house after leaving Mark at the barn, she found her mother washing the dishes. Ann got a towel and dried them, glancing out of the window each time she passed it on her trips to and from the cupboard with the dishes, expecting to see Mark coming back toward the house. But when he did not come out of the barn, instead of taking the winding path to the house, Mark walked with bent head and determined steps down the road toward the Wilson homestead. With an aching heart, Ann saw him go without even a backward glance.

The long hours of the late fall evening dragged slowly by while Ann, unable to concentrate on any reading or sewing, listened to every noise outdoors, hoping to hear Mark's step on the stoop. Once her mother said:

"What's happened to Mark?"

To which Ann answered, shortly:

"He had something to do at his house."

Realizing that something was wrong, Mrs. Clinton said nothing more. When bedtime came, she retired, but Ann sat up, still expecting Mark to come. Then she took to pacing back and forth between the kitchen and the living room in an effort to control her agitation, but quietly so as not to disturb her mother. At midnight she finally went to bed, only to say over and over to her-

self: Mark is going to war; he's going to war. We only have a few days. He's mad at me and we're losing the time that we might have together.

Finally, emotionally and physically exhausted, she fell asleep, only to awake and sit straight up in bed every time the wind stirred a shutter or there was some other noise that might be her husband's footsteps on the stairs.

The next morning her mother looked at Ann's tired, strained face and for once had enough wisdom to keep silent. They got breakfast together, Ann setting a third place in case Mark came. But still he didn't arrive. After they had cleared the table and washed the dishes, Ann, now a little angry, went to the barn to do the chores. It was downright inconsiderate, even mean, she thought, for Mark to give her such a bad night. It didn't help her feelings, either, to have to do the chores. She certainly would tell him what she thought of him when he showed up!

She went back to the house and tried to occupy herself with some of the household work, but her heart wasn't in it, and she spent most of her time watching the road. Then toward the end of the morning, unable to stand it any longer, she almost ran over to the Wilsons, and when she found that Mark had gone back to the Army without even saying goodbye her cup of bitterness overflowed. It had been hard enough to part with her young husband the first time, which now seemed so long ago; it had been a dreadful thing to learn from George Wilson's letter that Mark had been condemned to death as a spy; she had thought she had come to the ultimate in trouble when the wheels of the train carrying her and Nancy to Washington had kept singing: "You're too late! You're too late!" But when, with all the worry and unhappiness, she had at least been secure in her knowledge that her husband loved her. Now she wasn't, for how could anyone who really loved you do what Mark had done to her?

Utterly crushed, she returned to her own home, her steps dragging. How could two human beings, she wondered over and over, be as close as she and Mark had been, and yet seem so like utter strangers as they were now?

Gradually she grew calmer, but more bitter and disillusioned. Marriage, she thought, is supposed to be the closest relationship in the world, but when it came right down to it, what did one individual know about another, no matter how close they seemed to be at times? And love—her lips curled into a sneer as she thought of that word; love is just something to fool people into getting married. And when they get married, what happens? Her father and mother were kind, good people and must have some affection for each other, but when did they ever show it? It was the same with the Wilson family. They didn't quarrel, but what romance was there? And with her and Mark! Married only one day, and then he had rushed off to war. He thought more of his country than he did of her.

Back in her bedroom she looked at the grim white face in the milky old looking glass on her bureau.

"Well," she said aloud, "those are the facts of life and the sooner I make up my mind to them, the better!"

Then suddenly the grim lines disappeared from her face and her mouth twisted in pain. Crying, "Oh, Mark! Mark!" she threw herself face downward on her bed and broke into uncontrollable sobs.

Endless days followed while she waited for a letter from Mark. The evenings were the hardest, for now it was dark by five o'clock and the evenings were longer. It had always been hard to have Mark away and to worry about the danger he might be in, but she had been able to fill up the long hours with the farm work and with reading and knitting. Now with despair

(Continued on Opposite Page)

## Spud, the Outdoor Man

NO DRUMS

(Continued from Opposite Page)

in her heart, she found it impossible to settle down or concentrate on any of the homey tasks of life. Naturally healthy and strong, she ordinarily had a good appetite. She could scarcely remember when she had skipped a meal, except when she had had some childhood disease, but now she had lost all desire to eat and had to force herself to choke down the food in order to keep going.

Two evenings after Mark's departure she saw Henry Bain drive up, hitch and blanket his horse, and stride rapidly toward the house. He greeted Mrs. Clinton cordially, and when he shook hands with Ann he gave her hand an extra pressure, his face radiating kindness and sympathy.

"Too bad," he said, "that the boys had to go back."

He stayed all evening, responded pleasantly to Mrs. Clinton's efforts to keep the conversation going, and was the soul of courtesy and consideration to Ann. In her present mood of loneliness and disillusionment, Ann found herself wondering if Henry was as bad as he had been painted. Certainly he had never been anything but kind to her mother and, in fact, to herself, in spite of the rebuffs she had given him. After all, she reflected, you couldn't hate a man for liking you and maybe, too, he was right about this war business—that the men ought to stay home and look after their families. Anyway, his visit helped her get through one evening, and she was grateful.

The morning brought Mark's letter, and all thoughts of Henry Bain were forgotten. Whatever that letter contained she couldn't share even with Nancy. She took it to her room to read and re-read, and as she poured over its lines most of the bitterness passed out of her heart, leaving only a great sadness.

"Poor Mark," she thought. "He feels just as bad as I do. Maybe I haven't thought enough about all the troubles and worries he has been through. Maybe I was wrong not to give more consideration to his suggestion that we let Henry Bain take the farm and start a home elsewhere. Oh, if he were only here we could let bygones be bygones, but we need to be together to get rid of all the bitterness." Then she said aloud, with vehemence:

"It's this awful war that's making all the trouble! Is there any cause or is it necessary that it must cause misunderstandings, break up homes, kill or wound those we love?"

Then she voiced the cry of millions of women before her:

"Why, O God, why is war necessary? Why do men tear themselves to pieces while we women work and wait and sacrifice, eating our hearts out in loneliness and worry?"

Before she could sleep, Ann answered the letter, taking much of the night to do it. Like Mark, she found it difficult to put her feelings on paper in such a way that he would surely understand that in spite of all the frustrations and misunderstandings, he was still her husband and she was still his wife, and they loved each other.

Mark's next letter to Ann was the longest she had ever received from him. It went into considerable detail about the life in camp as the two armies lay opposite each other on the north and south shores of the Rappahannock River. His somber mood was reflected in his descriptions of the cold, wet weather, the scanty rations, the muddy, almost impassable roads, and the poorly clad, sometimes barefoot men.

"There are many sick in the hospital," he wrote, "with little or no accommodations."

"You probably read in the papers," Mark continued, "that McClellan didn't chase the Confederates back from Maryland fast enough after he defeated

them at Antietam to suit Lincoln and the War Department, so they put Burnside in command. But the men are wondering if he is any better than McClellan. We lie here in camp on the north side of the Rappahannock, cold and hungry, day after day and night after night, doing nothing. And every morning when we get up we can see that the Confederates have built more breastworks and moved in more men to defend them if we attack.

"Across the river from us and not far from the bank is the town of Fredericksburg, and then a little farther to the south there is a small hill on which the enemy is building up his breastworks every night. Located on this hill are several batteries. We are so close that we can almost see the mouths of the cannon pointed toward us. It's queer—we fight to kill each other, and yet I feel no hatred toward the boys on the other side, nor do any of the others. I think the Johnnies feel the same way, because for a long time now we have been actually visiting with the men in gray on the other side, and we frequently trade our coffee with them and other stuff for their tobacco and some of the other supplies which they have more of than we do.

"One night our brigade band started to play *John Brown*. Then it stopped and, by gracious, a band on the other side played *Dixie*. Both sides started yelling and hurraing and when they quieted down again, our band struck up *The Girl I Left Behind Me*. It was answered with *Maryland, my Maryland* by the bands on the other side. Then, led by the bands, first one side would roar out a rollicking tune, and then thousands of men on the other side would answer with another tune. Finally, our band started to play *Home, Sweet Home*. Our men began to sing it, the first thing we knew the other side was singing and playing the same tune. No one was thinking of fighting. All of us were just a lot of homesick boys. I had such a lump in my throat that I had to stop singing. War is a strange business!

"Most of us have concluded that we are going to stay right here all winter and aren't going to move across the river to attack the Confederates until spring."

The rest of the letter, apparently written a few days later, was dated "On the Rappahannock, December 9, 1862."

"I haven't had a chance to finish this letter until now," Mark wrote. "Everybody's excited. We haven't had any orders yet, but there is activity at headquarters and we think we are going to move after all. How we'll get across that river with the Rebel sharpshooters in the Fredericksburg houses picking us off, I don't know. Neither do I know how we'll ever take those strong fortifications on that hill.

"I don't want to seem too depressed or to make you feel that way, but we are on the eve of a battle. Should anything happen to me before I see you again, I want you always to remember that I love you, and that I ask your forgiveness for any trouble I have ever caused you. You are young, you have most of your life before you, so just in case anything happens, remember it is my wish and hope that you will get more happiness out of life than you have had in the past. If that eventually means marriage to another man, that will be all right with me."

Blinded by tears and her throat aching, Ann crumpled the letter and threw it on the floor, exclaiming:

"Just as if I didn't feel badly enough without his having to write something like that."

Then she picked up the letter again, carefully smoothed out the pages, and said aloud:

"Oh Mark, Mark! Are you just sad because we are separated, or is this a premonition of disaster?"

## SUNNYGABLES NOTES

By John Babcock

**A**NIMAL AGRICULTURE is a familiar term to the readers of this page and to Northeasterners in general.

This is not so, however, among the people who use our farm products, nor among the many who depend on Animal Agriculture for their livelihood. I refer to the manufacturers of the thousands of items needed to process, transport and merchandise perishable foods and to the millions of people, who prefer and thrive on milk, meat, butter, eggs and cheese.

Back in April I was privileged to attend the first meeting of the Institute of Animal Agriculture held at Purdue University out in Lafayette, Indiana. I think most big meetings are often a waste of time, but this gathering really impressed me. While the Truman - MacArthur wrangle stole the headlines, and Di-Salle was carrying out his completely negative program of establishing meat price ceilings, this group met with a common objective: to learn the means whereby more people could understand and advance the far reaching benefits of an Animal Agriculture program.

Two things particularly impressed me at the meeting. From a gathering that included top representatives of industry as well as our most practical agricultural thinkers, came a very simple truth: the price of any agricultural or industrial product can never be lowered by producing less of it. That summarizes my attitude toward the false government ceilings that restrict production.

The other fact that was pointed up was that farmers don't need to be sold on Animal Agriculture any more than they have to be told what soil conservation is. In our meetings, publications and practices we can learn better how to use Animal Agriculture, but the big job is to *pass along to non-farm folks the benefits of a program that harms no one and benefits everyone.*

Before we sell our products to the public, we must sell ourselves and the principles we stand for.

### GALS IN THE GARDEN

**L**AST year, Marcella Yapple and Jean Conner laid out and planted our Sunnygables garden with an eye to the future. There was a lot of hard work, but Marcella, who was raised on a truck-garden farm and was pulling weeds as soon as she

was old enough to creep, provided the faith and leadership needed. This year the hard work begins to pay off.

### Irrigation

The girls picked the best site on the farm for a garden—right next to Jack's irrigated pasture. In addition to badgering the boys to do a little plowing and occasional cultivation with the tractor, Marcella sees to it that the irrigation system is brought close enough to the pasture fence to throw water over the growing produce. With a guaranteed water supply, she will guarantee fresh fruit and vegetables on the table and for the freezer.

### Berries Coming On

Jean Conner is an apt pupil, but, straight from the city, she had a hard time last year understanding why Marcella plucked the blossoms on the strawberry plants. It looked like she was deliberately cutting strawberry shortcake off the summer meal schedule. Marcella admits there are two schools of thought on this question, but feels that by holding back production the first year, the berries will hit their stride this second season. She predicts 875 quarts from the 875 plants set out.

In addition to strawberries, the fence row also is lined with raspberries, black loganberries, gooseberries, currants and blueberries. There are also 500 asparagus roots on which the girls are waiting patiently.

### Enthusiasm High

I'll admit that I've been as difficult to find when there was garden work as the next man. And Jack until last year had a particular knack for being extremely busy or just plain non-existent when gardening comes round.

I asked Marcella if she had much trouble getting help with the garden work, and whether the garden was paying off. "Goodness yes," she snapped back, "and if you don't think it pays off, you should have seen Jack out there last summer. He took one look at the food bill savings and joined right up with us."

As things come along in the garden, Jean and Marcella work together to pick, process and freeze. This usually means that one of them has to act as baby sitter while the other makes trips to the garden.

The most successful crops last year were early peas, Luther Hill corn (we call it Tom Thumb) and some wonderful red potatoes. This

## BY GOLLY, IT WORKED!

I have had a lot of help at Sunnygables in working out a way to remove long grass silage from our trench. Some of the ideas seemed sound, while others were about as half-cocked as many of the things we try at the farm.

Strangely enough, it was a far distant reader of the AMERICAN AGRICULTURIST who came up with the solution. From Chicago came a letter from a chain saw manufacturer who had heard of our problem through a reader in that big city. He thought his saw would do the trick. I politely wrote him several good reasons why I thought it would not work, but invited him to have a try.

With a specially built chain, Jack Conner soon saw that he could slice the tangled mass like cheese, removing squares of silage just big enough to handle easily with a fork. Jack has emptied the silo, and with a year of mistakes behind us, we're ready to try again - - - this time with assurance that we can remove silage in a few minutes' time for each day's feeding.

— Photo by C. Hadley Smith

year the berries come into their own.

### Geese and Strawberries

In New Mexico, my brother Howard keeps a flock of geese to weed the cotton fields. By watering the geese first at one end of the field and then at the other, the geese start busily down one row apiece and eat the Johnson Grass as they go.

Marcella says that near Rochester, N. Y., where her family gardened, geese were used to keep grass out of the strawberry patches. They don't seem to take to the round, tough, bitter strawberry leaves, and they carefully pick out the grass between plants. I don't know whether it will work and I would be interested in any report of experiences with geese, quack grass and strawberries.

### SILAGE AS A MULCH

**W**E have spread spoiled or left-over silage from the surface of our trench on crop fields or used it as a garden mulch. The question came up again the other day as to whether mulch of this type left the soil acid. After all, one quality of grass or corn silage is its high acid content.

Similarly, farmers have been leery of using woodchips or sawdust as mulch for the reason that acid derivatives are obtained from wood.

As far as I can find out from questioning, dead plant matter will not add to the acid content of the ground — even good tart silage. The processes of decay send the acid content off as carbon dioxide. The remaining decayed material sweetens and adds to the water-absorbing quality of the soil.

An Ohio farmer I know proved this for himself. When he was advised not to use sawdust as a mulch in his garden, he took a sample of soil from beneath an old sawdust pile. It tested less acid than the surrounding soil.

### IMPORTANT WEEK

**T**HE right start with grass silage operations is very important to us at Sunnygables. Looking back over the years, we have had a bad summer every time we started too late in the spring. I think the week before we actually start cutting is the most critical period. It is then that we can get set to go, with the odd jobs all out of the way. There is plenty of tension in the air before we start the "Spring Offensive."

### When to Start

Emphasis on cutting grass as early as possible for silage has often left me with the impression that we just can't start too early. If a very short first cutting is taken off, the volume is gained in second cutting.

I find, though, that it injures legumes if they are cut before they have started to bloom. Alfalfa gains in nutritive value until it is about at its peak at the full blossom stage. Of course we can't get it all on that particular day, so we intend to start about the time blooms show on a few plants. This would be the theoretical 10 per cent bloom stage. From then on, it's a race to get first cutting off before stems get tough, woody, and too dry to keep well.

One factor we intend to keep in mind as we start cutting is that young grass has extremely high water content. Since we will use no preservative with our first cutting, long grass silage, we will have to be careful to wilt down to the 65 or 70 per cent mark.

### GET FREE INFORMATION

I have received a letter from an outfit in the mid-west, offering to furnish me with a correspondence course on turkey raising for \$10. They seem to have excellent references, and I would like to know if their course is any good.

On checking into this offer, we find that the "course" consists of mimeographed material taken from Experiment Station information and other sources. Such data is available free to anyone who cares to ask for it. They claim to teach a new way to raise turkeys, but there is nothing much new about the information they give.

With so much really good information available in bulletin form at your Experiment Stations and Colleges of Agriculture here in the Northeast, it is a waste of money to buy such "courses" as this one on turkey raising.

— A.A. —

### HANG UP!

The other day I received a telephone call from a firm in Toronto, Ontario, Canada. They told me that if I would send them the money immediately, I could get in on the ground floor as a stockholder in a new uranium mine just starting operations. This sounds pretty good to me as I know uranium is in great demand. What would you advise?

Ordinarily, the Service Bureau does not advise on investments. However, this is a horse of a slightly different color.

In our March 17 Service Bureau column we commented on Canadian mining stocks, but the uranium idea is a new angle. Much publicity has been given to the value of uranium, but if the stock offered really had the great value claimed, it wouldn't be necessary to solicit buyers. It would be grabbed up overnight.

The implied urgency of a long-distance phone call tends to rush the prospect, without giving him a chance to reason the thing out and to do a little checking on the outfit offering the stocks. Be safe, and check with us or with the Better Business Bureau in Toronto, Ontario, Canada, before putting any good money into Canadian mining operations.

— A.A. —

Although population has increased about 23 million since 1935, the 150 million people now have more and better food than the 127 million did then. Farm production has increased nearly 40 per cent. Per acre yields are up 50 per cent from the 1935 level.

## SINOX PE CONTROLS WEEDS IN BEAN FIELDS by PRE-EMERGENCE CHEMICAL SPRAYING

SINOX PE, a water soluble dinitro spray material, gives the best obtainable residual weed control in snap, kidney and lima beans. Excellent results have been obtained in Delaware, New Jersey, Long Island, Michigan and New York with SINOX PE in soils ranging from light sandy to heavy loam types.

One gallon of SINOX PE per acre gives good residual weed control for at least four weeks and usually eliminates two cultivations. Weeds controlled by SINOX PE are: Mustard, Lamb's Quarter, Ragweed, Pigweed (red root), Purslane, Wild Radish, Chickweed, Smartweed, Wild Lettuce, Shepherd's Purse and Wild Buckwheat.

See your dealer or write today for SINOX PE Spray Bulletin.

## For Dinner, Will You Have CORN or MEAT?

By Herrell DeGraff

**E**D BABCOCK'S clear, persuasive way of making things simple brought home to millions the fact that meat, milk, and eggs are not luxury foods. Entirely in addition to their health-giving properties these products, and the animals back of them, as Ed, so ably pointed out, are the indispensable balancing factors in our food supplies.

Even compared with China, the most populous country of the world, the United States has the greater output of food calories from crops. China uses her production to feed 450 million people. On a Chinese pattern of diet, but with somewhat more calories per person, this country could feed 500 million.

Figure it out this way: With one pound of corn providing 1,400 calories, 14 bushels would furnish 3,000 calories a day for one person for a year. With U. S. cereal production roughly equivalent to six billion bushels of corn, our grain crops alone would feed over 400 million persons. More than another 100 million could eat from other direct crop products and the livestock which could be produced entirely from our grasslands with no grain feeding.

### An Elastic Food Supply

Thus a population of 500 million could be provided with enough food bulk — but it would be a wretched diet from a nutritive standpoint. Not only would we be a poorly fed people, but our food processing and handling industries as we now know them would disappear. Every other aspect of our national life would be affected, and with our present or any prospective population of the country, the Commodity Credit Corporation would have surpluses on their hands such as have never haunted them in their worst nightmares.

We do not have a Chinese diet, and our grain-consuming livestock is the reason. Animals on our farms act as a great converter and concentrator of a gross food bulk which we could not possibly use as such, or sell to advantage. They transform grass and grain into highly nutritious foods and bring the gross bulk down to the requirements of 153 million people.

Thus American food supplies have enormous elasticity. They might be stretched to feed 500 million people poorly; or conceivably with still more livestock they might be shrunk to amounts that could be used by 100 million people or less.

That brings us to the question of how much grain should be fed to livestock and how much should be retained for direct human feeding and other purposes. It is the question of precisely how much shrinking down, or how much stretching out, of our crude crop calories should be done. A billion bushels of cereals is either great, or little, depending

There are more calories in the grain a cow eats than in the milk she gives, but who wants to live on a diet of grain?

entirely upon its use. It is a fantastic quantity if it is stored by the Commodity Credit Corporation; it provides, over a year's time, considerably less than a pound of meat per person per week if fed to livestock for meat production.

If, at any time the price of grain should be set too high, farmers respond by withholding it from livestock, and we have "surplus" grain. If the price should be set too low relative to livestock prices, too much grain may be fed. There is not, and there can never be, any such thing as one price for corn or other grains which properly determines how they shall be used. More accurately there are millions of farmers, each deciding under his own

Grain surpluses have never plagued the Northeast. Hogs, chickens, beef cattle and dairy cows turn grass and grain into meat, eggs, and milk for a better diet.

conditions, which is the last ear of corn for which his livestock will pay his reservation price, and which ear he will hold back because they won't pay enough for it.

If by the exercise of central authority, either grain prices or livestock prices become arbitrarily fixed, the essential elasticity of our food supplies is lost. No one then knows how many bushels of corn should go to hogs and how many to other uses. The only guidepost producers then have is the officially-fixed price.

A committee of all-wise experts might possibly, at the beginning, set a price which would be right at that moment. Even if they did, in almost exactly no time it would be wrong.

### Surpluses Reflect Mismanagement

It was his insight into this situation which led Ed Babcock to carry his crusade across the country for a flexible animal agriculture. It made no sense to him to have feed grains blocked off from their normal function as raw material for a good diet by government padlocks on the cribs. He saw clearly that such a policy led only to unwieldy and expensive "surpluses" — and that in reality the surpluses were the result of mismanagement of our food.

Surpluses disappeared during World War II, only to reappear in the late 1940's. Then again we were said to have, among other unwanted foods, a billion bushels of surplus cereals. But that these were not in reality surpluses is a fact which seems to have been entirely missed by many (Continued on Page 15)

## Power Fork for Grass Silage

THE PICTURES below show how Mark Robinson of Tunkhannock, Pa., removes chopped grass silage from his trench silo. The silo has concrete sides and a concrete bottom. In an early issue, Mark will tell you how he did the concreting.

Mark says that the tractor-powered fork penetrates the silage easily, the lift breaks it away without any trouble, and there is no difficulty in carrying it to the truck.

In this way, one man can load three tons of silage in 20 minutes. It takes a man 3 hours of hard work to pitch the same amount by hand.

Digging into the grass silage with a power fork.

Backing out of the trench silo.

## PRICE FIXING AND THE FARMER

EVERY Sunday afternoon there is a most interesting and informative program on television called "Meet the Press." Each time several outstanding newspaper reporters meet with some nationally or internationally known leader and put him on the spot with very keen questions.

Yesterday afternoon, May 20, I listened to the questions addressed to Mr. Michael DiSalle, the price administrator, and his answers to them. A woman reporter expressed the city consumer point of view when she asked DiSalle why he was unfair to consumers in not putting the prices of farm products under the same controls as those on other commodities.

DiSalle replied that the law forbade him to fix prices on those farm products that were below parity. (Parity is a fair relationship between farm prices and farm costs.) DiSalle further stated that he agreed with the law that farmers should not be penalized, and that everybody is dependent upon full farm production.

So far, so good! But, of course, the reporter was not satisfied with this answer any more than are millions of labor union members and consumers. Their pressure to reduce food prices far outnumbers the farm vote and is tremendous on Congress and the politicians in the Administration.

To meet this demand for low food prices, the President has suggested subsidies to farmers, which, of course, are just an appeasement to consumers and which have to be paid out of taxes.

The index figure for prices received by New York farmers in January of this year was 258, or about 2½ times the base figure. The earnings of factory workers for the same period were 554, or 5½ times the base figure, while the cost of living index figure was 257, or 2½ times what it was in the base period. Those figures don't leave much of an argument for labor union leaders and politicians who claim that union wages should be boosted because the cost of living is high, nor do these same index figures give any support to the argument that farmers are being overpaid.

Another reporter read to DiSalle a letter from a small merchant enclosing a copy of the price regulations. The merchant wrote that he could not understand the regulations, and his lawyer had asked \$500 to cover his time and work for studying the regulations and telling the merchant how to operate under them!

Still another reporter on the panel asked DiSalle how, even with the thousands of people he had working on the price-fixing schemes, he could hope to make enough regulations to cover all of American business and get enough people to enforce them. DiSalle's reply in effect was that he hoped it would not be necessary to maintain price-fixing over a long period, thereby admitting that it would be an impossible job.

Black markets are already here.

## MILK SHED FENCES ARE GOING DOWN

MR. LELAND LAMB, one of the best cattle men I know, recently returned from several weeks' study of cattle and dairy conditions in Wisconsin. He raises a point that I have always wondered about on my visits to the Central West: Why is it that Wisconsin and other Central West dairymen can produce milk so much cheaper than we can here in the Northeast?

There are two partial answers: One is that Central West dairymen raise more of their own grain. Even if they didn't they are close to great grain supplies so they don't have to pay heavy freight charges. The other reason is the fact that in at least some other sections, the sanitary regulations for producing milk are not nearly as strict as those in the New York and New England milk sheds. It costs money to meet the regulations.

*By E. R. Eastman*

But whatever the difference in the cost of production, eastern dairymen can be certain that the time is not far distant when they will have to meet more national competition in the production of milk. The fences around the milk sheds are going down because of the increasing number of acceptable substitutes for fluid or Class I milk.

It's a long time since people had to get used to the change of taste in milk caused by pasteurization. Raw milk would now taste strange to them. Thousands of people raised on evaporated milk prefer it to fluid milk. Powdered milk is being used in increasingly large quantities, and, more recently, processes have been invented for concentrating milk so that when reconstituted the taste is not too much different from fluid milk. Dietitians and health authorities are urging poor people and those on welfare to use these substitutes for fluid milk, telling them that the food values are practically the same.

These changes in the use of milk are part of the rapidly changing times. There is no use trying to resist them; the right policy is to accept them and prepare for them. Thousands of eastern dairymen are rapidly getting their business in shape to meet these changes. How to do this has been pointed out many times. It means reducing the cost of milk production through the use of more machinery; less hand labor; improved pastures; better meadows, particularly with more legumes; grass silage, and, if possible, growing more hybrid corn and other grain.

## EQUIPMENT DEALERS HAVE TROUBLES

IF you are having trouble in getting new parts or repairs for your equipment, don't be too hard on your local dealers. They are just as anxious to help you and to keep your business as you are to be helped.

But the local dealers are certainly having their difficulties in getting and keeping on hand the wide variety of parts that are now required in these times of scarcity. And like farmers who hire help, it is hard for the local dealers to get well-trained repair men now because of the opportunities they have to make more money in other jobs.

## KILL THAT FLY!

THE Pennsylvania Medical Society states that it is possible for one pair of flies to have 5,373,000,000 descendants within three months. Flies' eggs hatch in a few hours, and the young flies become adults in ten days, when the female starts laying eggs. It pays to get the first ones.

Say the doctors: "Flies are a positive menace to health. They dote on dirt, frolic in filth, gloat on garbage. After wallowing in germ-laden filth, they wipe their feet on what you eat, or crawl over the baby's fingers or lips."

Fortunately, fly sprays are now much more effective than they were even a few years ago.

## TWO FARMERS

OFTEN I think of the methods of work of two old farmer friends of mine, now gone to their reward. One of them was a calm, rather slow-moving individual, but somehow he seemed to make every move count. No matter what the weather or the pressure, his work was so planned and executed that it was always done on time.

The other farmer always seemed to work on the run. He was always so tired, always worried, and some way or other always behind with his work. The result was that the first man made a living and got some fun out of life as he went along; the second

one, with all of his hard work, just seemed to get by, and didn't have much fun doing it.

These two different types of farmers are in every neighborhood. The old-timers had a saying for the man who gets his work done on time: "He makes his head save his heels." In other words, the difference between the two kinds of farmers is careful planning, with the plans flexible enough so they can be changed with the weather or other unavoidable conditions.

## WHERE OUR TAX DOLLAR GOES

SPEAKING at a Rotary Club luncheon at Trumansburg, New York, recently, Assemblyman Ray S. Ashberry gave these interesting but alarming figures on how the tax dollar is spent in the various divisions of our government:

	1940	1950
To Washington	44%	79%
To Albany	15%	8%
Stays Home	41%	13%

Commenting on the above figures, Mr. Merrill Knapp, Editor of the Trumansburg Rotary Bulletin, said:

"How did this happen in ten years? It's a completely different concept of the function of Federal government. IF WE DON'T DO SOMETHING ABOUT IT, NO ONE ELSE WILL."

## THREE HUNDRED TWENTY IMPORTANT MEETINGS

IN New York State there are now 411 central school districts. Of these, 91 held their annual meeting on the first Tuesday in May. If you are a voter and live in one of these districts, I hope you attended and took part in the meeting.

Under the law, central school districts have their choice of holding the annual meeting on the first Tuesday in May or the first Tuesday in July, and 320 of these districts have chosen to hold theirs on the first Tuesday in July, which this year falls on July 3.

If you live in one of these 320 central school districts in New York, make a note of the date and try to attend the meeting and take an active part in it. AMERICAN AGRICULTURIST, Freedom on the March, the Board of Regents, the New York State Education Department, and many boards of education are urging more local interest in and control of the schools. The most important place to start this interest and control is at your annual school meeting. Good government begins right in your own community.

## EASTMAN'S CHESTNUT

IN my opinion the best chestnuts are the human interest stories right out of life, like this one a friend of mine told me a few days ago. He said:

A female talking machine—you know the kind—called my wife on the telephone. I answered, and when I told her that my wife wasn't home, she said, "Well, you'll do just as well."

Then she started in to talk, talk, talk. All I had to do was to say "Yes," "Is that so?" and "Aye!" once in a while. After about five minutes I remembered that my furnace needed coal, so I very quietly laid the telephone receiver down and went downstairs, shook down the furnace, put on some coal, and came back upstairs again.

I started to put the receiver back on its hook, but hearing it rattle, I put it to my ear and, believe it or not, the "talking machine" was still going. I said a few more "Yesses," "Is that so's," and "Ayehs," laid the receiver down again and sat down to read the paper. After a while I thought my wife's friend must certainly have run down by this time, but on checking I found that she was still going.

By that time, my wife had returned, so I handed her the receiver and went out to work in the garden!

# AA's Farmers' Dollar Guide

**WHEAT:** May estimate of winter wheat production was 682 million bushels, a drop of 44 million during April. The estimated acreage which will not be harvested increased from 23.4% to 26.6%.

This year's total feed-grain acreage is estimated as 4% below last year. However, the situation is not yet serious. The feed grain carry-over is estimated at 15% below a year ago, but is still one of largest on record. Officials figure we can export up to 300 million bushels of wheat for the 12 months beginning July 1 and still have a 1952 carry-over of 250 to 300 million bushels, providing the 1951 crop is a billion bushels or more.

Winter wheat is now estimated at 682 million bushels, compared to 750,666 last year and an average of 1940-49 of 791,764 bushels. To this will be added the spring wheat when estimates are available. The earlier "Intentions to Plant Report" on spring wheat was 21,850,000 acres; last year, 18,509,000 acres.

**FRUIT:** The prospect is for an average crop of apples in spite of heavy frost damage to all fruit in Idaho, Washington and Oregon, and some damage in the South. In 10 southern states the peach crop is forecast at 3 times last year's crop, but slightly less than the 10-year average. In New England and New York there was some winter damage to peaches, but large crops are expected and at least an average crop in New Jersey. Outlook for pears is good in most states but there was frost damage in Michigan, Washington and Oregon.

**POTATOES:** One opinion is that the probable 15% decrease in potato acreage will about balance the lack of price supports, and therefore potato prices may be close to 1950 levels unless production is lower than expected. Early potato acreage is estimated at 74,500; last year was 92,100.

**MAPLE PRODUCTS:** This year's U. S. production of maple syrup was 12% below last year, and production of sugar was also low.

**HAY AND PASTURES:** U. S. conditions as given by crop reporters on May 1 indicated about an average yield of hay. Pastures have been slow but in most regions conditions on May 1 were better than a year ago.

**MILK PRODUCTION:** The first 4 months of this year, milk production was about 2% less than a year ago but was higher than for the same period than in any other year except 1945 and '47.

**EGGS:** Egg production in April was 2% below April last year but 1% above the 1940-49 average. Production was less than last year in all areas except in North Atlantic and East North Central states. Hens on farms April 1 were 3% fewer than April last year, and 1% below average. Young chickens on farms May 1 are 5% higher than a year ago and 2% above average. Relatively few eggs went into storage this spring for use next fall, and demand is expected to be good.

**PRICES AND CONTROLS:** Farm organizations (except Farmers' Union) and business groups are opposing continued price controls. Prospect is that they will be continued but with brakes applied by Congress. Before House Agricultural Committee, administrator DiSalle admitted that all experts consulted, including USDA, advised against ceilings on beef. Price orders on hogs, chickens, eggs and other food products are reported as written, ready to be put into effect the minute prices on them reach parity.

Attempt to put ceilings on farm products below parity is bogging down. One argument for them was that parity keeps climbing, but it wouldn't climb if the price control program on supplies farmers must buy was really working.

Administration program still seems to be to try to keep food prices low and make up the difference by subsidies.

In 1950, net farm income was 13 billion dollars compared to 14.1 billion in 1949. In 1950, net farm income per person was \$804 (1% below 1949) compared to average per person for non-farm population of \$1,546 (3% higher than '49).

—H.L.C.

## The Song of the Lazy Farmer

except beneath bright paint. Of course, it's true a tractor man gets things done faster than I can, but gettin' more work done each day I don't call progress anyway.

I'M TIRED of hearin' orators, or readin' desk-bound editors, who love to tell with fancy word how deeply they are thrilled and stirred about the progress we have seen since we've been farming by machine. With catch in voice and tear in eye, they point with pride how you and I no longer have to break our backs at shockin' grain or buildin' stacks. They make a tractor's purr, by gee, sound like the finest poetry; they think a combine, self-propelled, is power and beauty unexcelled; you'd think the way those fellows speak, we'll soon work just one day a week.

For my part, I can't go along with notions that there's nothing wrong with cold, unliving cogs and gears or roar of engines in our ears. Somehow, I've never learned to care for gasoline-polluted air; let's get this beauty business right, how can there be a finer sight than teams of horses or of mules, which are lots smarter than the fools who've got themselves convinced there ain't no power

## Less Labor Milks More Cows and Handles

## More Milk with the Flexible Model F

# DE LAVAL COMBINE MILKER

Milk This Way...

### INSTALLED IN A SEPARATE MILKING ROOM...

Milking 30-35 cows per hour per operator is common practice in many dairies using the De Laval Combine Milker installed in a separate milking room in connection with either a loose housing or stanchion-type barn. Stoop-ing, squatting, walking from cow to can and carrying milk are eliminated.

Or This Way

### OR IN YOUR DAIRY BARN OR MILKING SHED

Dairymen are enthusiastic about the wonderfully efficient results obtained with the De Laval Combine Milker installed in the barn or milking shed. One man milks 50 or more cows per hour. The teat cups are moved from cow to cow and the milk is conveyed through sanitary pipe to the milk room.

## ...and Handle Your Milk in Any of These Three Ways

### Run Directly into Cans...

Most Combine users have installations which automatically filter the milk and fill the 40 qt. cans in the adjacent milk house. Carrying and pouring are eliminated.

### Aerate, Cool and Can...

In some sections, such as California, the installation is arranged to filter and convey the milk and discharge it over a surface cooler, thence into the 40 qt. cans.

### Discharge into Farm Tank

The De Laval Combine discharges the milk into the refrigerated farm tank, from which it is either "canned off" or pumped directly into the milk tank truck.

# AUREOMYCIN

gives  
NO QUARTER  
to  
MASTITIS

Use of Golden Drug Quickly  
Returns Cows to Production of  
Salable Milk

Fast-acting VETERINARY AUREOMYCIN Crystalline OINTMENT is the chosen treatment for mastitis by thousands of top dairymen.

VETERINARY AUREOMYCIN Crystalline OINTMENT is:

- The drug of broadest activity against mastitis.
- Easy to infuse with rolled-in infusion tip.
- Rapid in spreading throughout udder.
- Active for more than 48 hours.
- Used without interruption in milking hours.
- Infused without syringe or milk tubes.

In cases of acute septic mastitis, in addition to udder infusion, the injectable form of SULMET\* Sulfamethazine Lederle\*\* should be used. SULMET OBLETS\* may be given as subsequent treatment.

VETERINARY AUREOMYCIN Crystalline INTRAVENOUS Lederle\*\* may be used in the treatment of severe septicemia as a highly effective agent against a broad range of bacteria.

VETERINARY AUREOMYCIN Crystalline OINTMENT may be used for the prevention of superficial udder infections. When obvious injuries to the udder or teat occur, it is advisable to apply this ointment locally to the wound. At the same time infuse each quarter so affected with one full tube of AUREOMYCIN OINTMENT as a preventive measure against mastitic infections.

For maximum efficiency in the use of AUREOMYCIN OINTMENT for Udder Infusion and best management practices and disease-control procedures for avoidance of re-infection, consult your veterinarian.

Write for folder on AUREOMYCIN OINTMENT.

J. Clifford Young, Greene, N. Y., is so pleased with this round barn he's used for 36 years that, if he didn't have it, he'd build another!

## ROUND BARN:

By JIM HALL

### "So Good I'd Build Another"

I HAVE driven past J. Clifford Young's round barn near Greene, in Chenango County, New York, dozens of times in the past few years — always wanting to stop and visit but never having time until a few weeks ago. I thought, like a good many others, that the round barn mustn't be so good or a lot more farmers would build them. I had my mind changed.

Cliff Young told me that he is so well satisfied that if anything should happen to it, he'd build another just like it. "That barn was built by my neighbor, Verne Bates, back in 1915," Cliff said, "and believe it or not, I keep right on finding more advantages in its design."

I spent nearly two hours in and around the barn and had to admit my surprise at its efficiency. The barn, 80 feet in diameter, ties up in one great circle of stanchions, 51 of Cliff's 65 head of purebred Holsteins and there's still room around the outside wall for calf pens. In the center is a 14 by 70-foot silo that is filled with 300 tons of chopped grass and corn silage from the barn floor. His first cutting of grass goes in the silo because he gets a better crop of feeding hay off the second cutting. In the basement, feed bins are built around the side of the silo so that grain can be dumped in from the main barn floor above. On a loft, built around the silo like a mezzanine floor above the main barn floor, are hay-curing ducts that lead fan-blown air all around the outside of the silo and then via a slat floor, up through the hundred tons of hay he can mow on the loft. The main floor can hold 200 tons more.

Cliff's farm came into his family back in 1835—more than 100 years ago—when it was purchased by his great-grandfather, Sam Thomas. When Cliff needed a new barn in 1915, he found that it would take 15,000 board feet more to build a regulation barn than the round one Verne Bates suggested. "It would take a 124-foot barn to give me the capacity I have," Cliff said. "Even today it would be cheaper to build a round one."

Being able to drive in the barn and make a circle around the silo has great advantages whether they are drawing in hay, grain or chopped straw, but the real pay-off, according to Cliff, comes in the labor saved in the stable. All hay, silage and grain is available at the front of the cows and when they get through wheeling a carload around the cart is right back where they need it for next time. Chopped straw for bedding is delivered down chutes to the rear of the cows and a gutter-cleaner makes a clean sweep of the 220-foot circular gutter, delivering

manure to the spreader in 15 minutes.

Another advantage that Cliff pointed out was that the stanchions, because they are built around a circle, are 6 inches wider at the back—where more space is needed—than at the front. Cliff says he has never seen another barn as convenient to work in as his own. And Verne Bates, the man who built it, liked the result so well that he put one up on his own farm next door!

RUSSELL A. WAREHIME, above, who has been farm manager on E. H. (Dick) Richardson's Lookabout Farm at Westminster, Maryland, for 10 years, got tired of hay forks tearing bales apart so he took a few days last winter to build in this hay elevator.

The purebred Holstein cows on the 480-acres are fed silage the year around and Kenneth Dougherty, herdsman, says the cows like the grass silage better than the corn used to refill the silos in the fall. This is the third year they've put up grass and they were foresighted enough to have a supply of molasses on hand to put with the almost pure alfalfa for the milking cows. Last year 62 head averaged 12,500 pounds of milk and 440 fat.

There are six men employed on the farm but they manage to raise almost all the feed—good alfalfa that gets about 400 lbs. of 0-20-20 fertilizer with boron every year; excellent ladino-orchard grass pasture; and enough oats, wheat, barley and corn to mix with minerals and oil meal so that they only have to buy a little 32% supplement. Fifteen to 20 Spotted Poland China sows take care of the extra grain.—A.J.H.

# Backsaver for Rex Burleigh

*His G.L.F. Stable Cleaner Cleans  
5 Gutters in Less than 7 minutes*

"My G.L.F. Stable Cleaner does the dirtiest, heaviest job in the barn for me," says Rex Burleigh of Snedekersville, Pennsylvania. "It's a real back-saver and ideal for me due to the layout of my barn."

Rex Burleigh went to G.L.F. Agent-Buyer Jim Judson, at Columbia Crossroads, Pennsylvania, and asked him to come up and install a G.L.F. Belt Stable Cleaner because "there isn't a man to hire in 90 miles" and he just had to have modern back-and time-saving equipment if he was to continue to do all the work by himself on a 227-acre farm with 52 head of grade Holsteins.

## *Saves 45 Minutes a Day*

"My cleaner is saving me at least 45 minutes on each load of manure," he says. "Before I got it, I could clean my five gutters by shovel and carrier in an hour (if I was in a hurry to go deer hunting!); but now I can clean out a load in exactly 6 minutes and 57 seconds by the clock and spread it in less than 10 minutes, if I don't have to go too far from the barn."

An extra 45 minutes a day means a lot to a man who milks 36 head with only the help of his two boys, Gary, 10 and Lary, 9. He even found time during the past spring to tap 450 maple trees and make 100 gallons of syrup.

## *An Unusual Installation*

There are 43 stanchions in Mr. Burleigh's barn—four rows of nine cows each, and one row of seven. The one cleaner motor was installed so that it

handles all five gutters through a series of connecting rods and universal joints.

The unusual installation to clean five gutters in one barn was a challenge to the G.L.F. engineers, but once Mr. Burleigh finished extending his gutters to the end of the barn, two men made the complete installation for all five gutters in two days, despite the fact that their work was outdoors in below-zero weather.

## *Simple and Practical*

The G.L.F. Stable Cleaner is the simple, practical answer to the meanest job on the farm. Tested and perfected in actual farm use, it will soon be available at all G.L.F. Service Agencies. Ask about it. Cooperative G.L.F. Exchange, Inc., Ithaca, N. Y.

# Some New Laws Affecting New York Farmers

By E. S. FOSTER

**T**HE New York State Conference Board of Farm Organizations presented its legislative program to Governor Dewey in a 2½ hour conference on January 23 and then placed a copy of it in the hands of every member of Senate and Assembly. For the most part the Conference Board's recommendations were quite successful.

**MOTOR TRUCK LEGISLATION.** Two years ago, by legislative act, a special commission was appointed headed by Senator George Manning of Rochester to study use and finance of highways and canals. Following many public hearings the commission brought forth legislation which was adopted by the legislature and signed by the governor making some drastic changes in the taxation of motor trucks.

**WEIGHT-DISTANCE TAX.** Chapt. 74 imposes a special use tax on all motor trucks with a few exceptions, having a gross weight in excess of 18,000 lbs. Section 1 of the law says:

"The legislature hereby finds and declares that the operation of heavy motor vehicles upon the highways of this state greatly increases wear and damage on such highways; that there is a direct relationship between the weight of the vehicle using such highways and the damage done to them; that the period of usefulness of such highways is shortened by such use; that the effect of such use is to create and augment hazards to pedestrians and other traffic and to impose on the state a heavier financial burden for highway construction, maintenance and policing than does the operation of smaller vehicles; that the provisions of this article are therefore necessary and are hereby enacted to distribute more equitably this financial burden and to compensate the state in part for the privilege granted to such heavy vehicles of using the highways of the state and for the cost of administering state traffic regulations."

### Farm Trucks Exempt

The provisions of this new law do not apply to trucks "owned and operated by a farmer and used exclusively by such farmer in transporting his own agricultural commodities and products, pulp wood or livestock, including the packed, processed or manufactured products thereof, that were originally grown or raised on his farm, lands or orchard, or when used to transport supplies to his farm or orchard that are consumed and used thereon or when operated by a farmer in transporting farm products from a farm contiguous to his own."

Under this new law trucks exceeding 18,000 lbs., other than those granted exemption, will in addition to all other truck taxes pay a millage tax per mile based on gross weight. The millage tax will range from 6 to 24 mills. Trucks whose gross weight ranges from 61,001 lbs. to the legal limit (23,500 lbs. per axle) will pay 24 mills per mile for the gross weight involved.

Trucks exempt, other than farmers' trucks referred to above, include those transporting U. S. mail under contract, government-owned trucks and those operating wholly within city limits and Public Service Commission zones.

### Enforcement

The bill appropriates 2 million dollars for enforcement. Weighing stations will be established throughout the state. Department of Taxation and Fi-

nance is given very broad powers in connection with administration and enforcement. Operators will have to make returns monthly to state. Penalties for violation are very severe. Effective October 1, 1951.

**BASIC TRUCK LICENSE.** Chapt. 668 fixes schedule of registration fees for licensing motor trucks. Under this act the fee will be shifted from 80c per cwt. on the weight of the truck unladen to 50c per cwt. on gross including manufacturer's weight of truck, plus maximum load. The law says "for the purposes of this subdivision, maximum gross weight shall mean the weight of the motor vehicle, plus the weight of the maximum load which such motor vehicle may carry as declared by the applicant within the legal weight limits provided by this chapter."

The manufacturer's weight of the motor vehicle and such maximum load shall be stated on the application for registration and shall be accepted for the purposes of registration hereunder, subject to audit and approval by the Commissioner of Motor Vehicles. This act affects trucks, hearses, motor vehicles with convertible or interchangeable bodies, or with removable seats useable as for both passenger and delivery purposes, motor vehicles commonly known as station or depot wagons and motor vehicles commonly known as light delivery trucks, weighing 1800 lbs. or more.

Under this act many farmers will have to pay substantially higher fees for registration of their motor trucks.

### Conference Board Objects

On March 9 the Conference Board telegraphed its opinions to Governor Dewey, Speaker Heck and Majority Leader Mailler of the Assembly to Senator Arthur Wicks, Majority Leader of the Senate and to Senator George Manning, chairman of the committee which sponsored the bill.

"CONFERENCE BOARD OF FARM ORGANIZATIONS MEETING IN SYRACUSE TODAY BELIEVES THAT MANY FARMERS WILL REACT UNFAVORABLY TO CHANGE IN BASIC LICENSE FEE ON TRUCKS TO 50c ON GROSS ON GROUNDS THAT AVERAGE FARM TRUCK USES HIGHWAY ONLY ABOUT 4,000 MILES PER YEAR AND CARRIES PEAK LOADS ONLY OCCASIONALLY. THIS WILL RESULT IN HIGH RATE PER MILE HIGHWAY USE."

This act applies for registration years commencing on and after January 1, 1952.

**Oleomargarine.** All bills to lift the ban on colored oleo were killed in committees.

**Payment of Farm Help.** Chapt. 445 exempts farmers from provisions of labor law requiring weekly payment of employees in cash.

**Rabbits.** Chapt. 236 provides that rabbits damaging farm property may be taken without license or permit by bonafide employees of owner or occupant.

**Genesee Valley Market Authority.** Chapt. 420 authorizes formation of the Genesee Valley Market Authority.

**Golden Nematode.** Chapt. 338 continues program aimed at control of Golden Nematode of potatoes.

**Rabies.** Chapt. 337 continues indemnity program on domestic animals dying from rabies.

**Deer.** Chapt. 512 continues program in central and western New York areas whereby open season on doe may be declared by Department of Conservation to reduce deer damage to agriculture.

**School Buses.** Chapt. 406 increases penalties for violating law forbidding passing school buses when passengers are being taken on or discharged.

## "Milk for Health" Program Starts in June

**S**UCCESS has crowned the efforts of a group of northeastern dairymen who for two years have worked on a program for promoting milk consumption. Over 37,000 dairymen have agreed to invest 1 cent a cwt. in the program organized by "Milk for Health."

The action putting this program into effect was taken by the Board of Directors for "Milk for Health" at a meeting at Syracuse on Monday, May 21. The board also agreed to support a Dairy Council in the New York Metropolitan area. New York City dealers will match funds put up by "Milk for Health" dollar for dollar. They will do this as soon as dealers handling 90 per cent of the fluid milk sold in the metropolitan area sign on the dotted line.

The New York City Dairy Council will have a Board of Directors of sixteen, eight representing dealers and eight representing milk producers. Monday, at Syracuse, Jacob Pratt, president of "Milk for Health," was appointed chairman of a committee to nominate the eight dairymen directors.

### Handy New Secretary

Ralph Eastwood who has been executive secretary of "Milk for Health" was on leave from G.L.F. for one year. That leave is up and his place will be taken by C. F. Handy, formerly County Agricultural Agent of Genesee County, N. Y.

For a complete understanding of what is taking place, let's review a little history. Over two years ago the Dairy Committee of the New York State Farm Bureau Federation spent a lot of time in discussing the need for a well-thought-out program for stimulating consumption of milk and its products. As a result of their deliberations a meeting called at Syracuse on April 25, 1949 was attended by approximately 250 dairymen from all over the state.

At the meeting, a small organization was set up known as "Milk for Health." This was felt necessary because a considerable number of New York State dairymen had been supporting ADA (The American Dairy Association) and others wanted to invest in the National Dairy Council, or both.

### How It Is Done

The programs of both agencies are excellent. ADA uses straight advertising, with money contributed by dairy-

men only. It also finances a research program to develop many of the facts on milk on which advertising is based. The National Dairy Council works through doctors, nurses, dietitians, and home economics experts, using money contributed by dairymen but matched dollar for dollar by dealers.

"Milk for Health" is merely an organization designed to get the signatures of dairymen authorizing the deductions, and then to turn over the money on the basis of five-twelfths to the American Dairy Association and seven-twelfths to the National Dairy Council.

### To Study Results

The Board of Directors voted unanimously to request the seven state colleges of agriculture in the area to study and report on the facts of milk promotion as conducted by ADA and the Dairy Council. This in time will give dairymen an unbiased report of the effectiveness of the money they invested for "Milk for Health." Also voted unanimously by the Board was an invitation to dairymen who do not ship milk to New York City but whose price is based on New York City to participate in the effort. As a result of this action, dairymen around many small upstate cities will be asked to give financial support to "Milk for Health."

Authorizations to deduct 1 cent a cwt. came from over 37,000 dairymen delivering to 405 of the 429 milk plants shipping milk to the Metropolitan area. Of the dairymen who authorized deductions, 21,000 belong to cooperatives who voted to participate in the program and about 16,500 signed individual authorization blanks. Thirty-nine dairy cooperatives are supporting the "Milk for Health" program.

Many a time, farmers have emphasized the necessity for telling their story to consumers. It will be done in the case of milk, and the monetary returns to dairymen will certainly be good; every quart of milk that is consumed as fluid milk rather than made into manufactured products increases the uniform price they get. Every cent contributed should return several cents in better prices. It took a lot of footwork to get the authorizations. The men who did it should feel very happy over the result. Two years ago, a lot of people said "It can't be done!"

# Increasing Turkey Egg HATCHABILITY

By C. E. Shepard

**I**F every turkey breeder could average 5% more poults from every thousand eggs incubated, he would be in a much happier frame of mind at the end of the year," said George Utzman, a White Holland turkey breeder of MacDougall, New York, to me recently. No miracle is needed to bring about such an occurrence. George accomplished it this spring by utilizing artificial insemination. A little-used practice to date, it started in turkeys at least 15 years ago.

"Our results weren't quite as good as we had hoped for this year, but this was our first attempt at artificially inseminating our hens, and it certainly paid off for us," said Mr. Utzman.

Gustave Utzman and His Son Inseminating a Turkey Hen

"We realized about 5-10% better fertility in the eggs that were incubated on our own farm, as compared to previous years. We incubated about 1,000 eggs early this spring. The toms were "milked" (semen drawn) every day at first to inseminate all the hens early. The semen from six or seven toms was mixed.

"After about two weeks the semen was drawn every 4-5 days. Only hens that wanted to mate and showed tendencies to mate were inseminated the second time. Toms can help handle hens naturally later."

Since the Utzmans do no individual pedigreeing or progeny testing, mixing the semen from several birds is the most convenient method and has the advantage of being stronger semen, since the toms that are fertile will make up for those that are not.

George and his father draw the semen from 12 toms in about 20 to 25 minutes. The supply of semen from this number of toms was used to inseminate approximately 70 hens. Bull semen diluter, obtained from NYABC in Ithaca, was used as a diluent for the turkey semen with the ratio of five parts diluter to one part semen. This being the first year that artificial insemination was undertaken on this farm, the speed in drawing the toms and inseminating the hens was not as rapid as it would have been if the Utzmans had had two or three years' experience behind them.

However, this much is sure. The Utzmans learned a great deal from their experiences this year and maintain that they will continue with the practice from now on. It is not uncommon for fertility to be as high as 70 to 75 per cent with natural service, but seldom does the average equal this figure. This per cent fertility can be obtained more

readily through artificial insemination, especially with breeding early in the season. The general feeling that has prevailed about not saving the first eggs laid by turkey hens early in the spring can be corrected through the use of artificial insemination. Hens can be artificially inseminated at or just prior to egg production, and highly fertile eggs can be expected.

## It Pays

The possibilities are wide as far as the turkey grower is concerned in bettering the fertility of hatching eggs. The process requires a lot of hard work, since every bird has to be handled, but with two or three years' experience, any breeder can expect to master the technique and derive considerable financial benefit from it. The toms "milk" better after a week or so, and early in the season the hens are easy to inseminate. They may not be ready all of the time, but through artificial insemination the operator can determine when the proper time to inseminate the hens has arrived.

Some toms on the Utzman farm failed to ejaculate any semen. This factor could not have been determined had it not been for the practice of artificial breeding. If such a tom were to be put in a pen with hens for mating, chances are the operator would not have been aware of his infertility until late in the breeding season.

It would seem that the best time for artificial insemination is early in the season, because practically all hens want to mate at once and the toms can't take care of them. Also, the flush of eggs comes about 2-3 months after the hens start laying.

The Utzmans want to make it clear that there is no substitute for pedigree breeding and progeny testing; but for the average turkey grower who can't afford this practice, artificial insemination, it would seem, would have its place. The better the breast of the White Holland bird (heavier the bird), the more trouble we may experience with poor fertility and the greater will be the need for artificial insemination. All of the "bugs" have not been ironed out of the artificial insemination of turkeys. However, the Utzmans are encouraged with their results this year and they feel sure that the fertility problems in their breeding flocks will be at least partly solved in the years to come.

— A. A. —

Although it is popularly believed that farm costs today are high, the fact is that cost per unit of output in recent years has been at the lowest level in 35 years of records. The main reason for this is high output per farm workers, which in turn comes from increased use of equipment and higher yields.

Try one now with your regular nest. We tell you how.

**BABCOCK'S HEALTHY CHICKS**

**MAKE GREAT LAYERS**

At the 1950 Storrs Conn Egg Laying Test, our White Leghorns won first all breeds, with 3899 eggs and 4124.5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the all-time World's record for all breeds all tests won in 1944-45.

**WE HATCH THE YEAR 'ROUND**  
White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks own two hatcheries with 600,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

## Plan Now for FAIR EXHIBITS

THERE are at least two reasons for exhibiting farm produce at fairs. You can pick up a little spending money and you can learn a lot about quality. I once heard a man say that he thought he grew pretty good stuff until he decided to exhibit some at the fair, and when he saw what his neighbors and friends brought in, he decided he better try to find out why theirs was so much better than his.

It is none too early to begin thinking about fair entries. With livestock, particularly young animals, you often find that one will develop better than another so it is a good idea to have two or three animals in mind for possible showing in the same class. Then too, it won't do any harm to give these animals just a little extra feed and attention throughout the summer.

Most vegetables, fruit and crops have not yet reached the stage where you can tell anything about their possibilities. You can, however, plan a little extra care in the line of insect and disease control. You can plan to add some additional fertilizer to crops and you can do some extra thinning to give the developing plants or fruits more room.

Before fair time we are planning to give you some information as to how to prepare various exhibits so that they will stand the best possible chance of taking home the blue ribbon. If you have never exhibited at a fair, why not do it this summer? It is a lot of fun and it can be profitable. If you feel that you just do not have the time, why not interest the young people in making some exhibits?

—A.A.—

### BORDEN EXECUTIVE HONORED

W. A. Wentworth, Director of Industry Relations, The Borden Company, New York, was elected Chairman of the Executive Committee of the National Dairy Council at the first quarterly meeting of the Dairy Council's Board of Directors in 1951 in Chicago. Mr. Wentworth is Secretary of the Borden Foundation which administers the annual Borden awards to persons in the United States and Canada who are selected for their outstanding achievements in research.

He succeeds E. W. Tiedeman, formerly General Manager of Central Dairy Sales Cooperative, Chicago, who heads the Dairy Branch of the Office of Price Stabilization in Washington, D. C.

George Hoad of Palmyra, N. Y., is the new president of the New York State Rural Youth Conference, made up of young people representing the Grange, Extension Service, Rural Church Institute, F.F.A., Young Cooperators and G.L.F.

George has operated a 175-acre dairy, cash crop and market vegetable farm for the past seven years (since the death of his father). He now has 23 head of purebred Holsteins in the milking row and 20 head of purebred heifers with which to expand his dairy operations. Cabbage, beans, sweet corn, and melons are the main cash crops on this early, well-drained, sandy loam farm.

George has more than enough to keep him busy at home but has found time to take an active interest in community affairs.

—A.A.—

### RASPBERRY PICKER

One of the latest mechanical wizards to be tried out in the State of Washington is a raspberry picker. It appeared that the problems facing the development of a successful cotton picker were almost insurmountable but certainly they seem small in comparison to a mechanical raspberry picker.

Briefly, the canes are trained on a trellis so that they lean toward the picker, then a rubber-tired shaker comes in contact with the bases of the canes and shakes the ripe berries onto a moving shuttle, then to a screen and eventually to a belt where a sucking stream of air removes leaves and sticks.

This picture shows the effect of chemicals in weed control when applied at the time of planting corn. Neither row of corn had been cultivated when this picture was taken.

## Question Box

**What causes ringworm in calves and how can it be controlled?**

Ringworm is a contagious skin disease caused by a fungus. An Iowa bulletin on raising dairy calves recommends painting the affected area with one part of salicylic acid to ten parts of alcohol. It is important to separate the affected calves from healthy ones and to disinfect the quarters thoroughly to prevent reinfection.

\* \* \*

**Does it pay to thin peaches in a home orchard?**

You will get far more satisfaction from the large size peaches, and the thinning will require little time on a few trees. Thin until peaches are 4 to 6 inches apart. Thin late in June when peaches are about  $\frac{3}{4}$  of an inch in diameter.

\* \* \*

**Is there any benefit from cultivating a garden when there are no weeds?**

Most authorities agree that the chief aim of cultivation is to kill weeds. However, the easiest time to kill weeds is just after they have sprouted. At that time you may not see them unless you look carefully. When weeds are young, they can be killed by shallow cultivation; for example, with a garden rake. This has two added advantages: the roots of the crop are not disturbed and new weed seeds are not brought to the top where they will sprout.

\* \* \*

**Does ladino clover need inoculating if seeded on land which has grown a good crop of alfalfa?**

The two legumes come in different classes so far as inoculation is concerned. The bacteria which grow on roots of ladino are the same as those that grow on red clover, but different from those on alfalfa. Therefore, ladino does not need inoculating when sown on a field that has grown alfalfa.

\* \* \*

**We recently purchased a house and in cleaning the cellar we are faced with a terrific amount of spiders. They spin their webs all over the walls and seem to make holes in the concrete walls. Can you suggest any spray or any method to combat these pests?**

Get some Lindane, or Benzene Hexachloride, or DDT at the feed and seed store and spray the walls, ceiling and floors once a week. You will soon be rid of them. — *Ed Mitchell*

\* \* \*

**When should borers be dug out of peach trees?**

Look them over for borers in May or June and again in October or November.

\* \* \*

**I have a pond of about an acre—between five and six feet deep, and spring fed. Would like information in regards to stocking this pond with fish—kind of fish and where I can purchase them.**

If pond is all less than 6 feet deep, you'd better stock it with bullheads. If one-third of your pond is at least 6 feet deep, buy bluegills and bass from some commercial fish hatchery; put a little fertilizer in the water (5-10-5) two or three times a season; some corn or oatmeal occasionally for feed, and after two or three years start fishing.

\* \* \*

**Is it safe to raise chickens on the same soil used last year, but where snow drifts very little and, therefore where the ground was thoroughly frozen during the winter?**

Some careful tests show that at least some types of organisms causing coccidiosis will survive a severe winter. Many poultrymen feel that the only safe procedure is to raise young stock on a given area only once every 3 years.

# No Wage or Price Controls No Subsidies, Say Dairymen

## Dairymen's League President Quotes Facts and Figures in Support of Stand Taken by Producers in 46 States

Almost half a million dairy farmers in 46 states officially have expressed opposition to the wage and price controls in the present Defense Production Act, and to the subsidies on agricultural products contained in a proposed new act, or in any future legislation.

### Here Are Reasons Why

Leon A. Chapin, president of the Dairymen's League and executive committee member of the National Milk Producers' Federation, summarized some of the reasons and questions which caused the 450,000 Federation members to protest. Here they are:

- We dairy farmers know that price controls operated to the disadvantage of milk producers during World War II.
- We know the confusion and horse-trading by labor and other pressure groups that have resulted from wage and price controls in the present emergency.
- We have Secretary of Agriculture Brannan's word for it that workers now can buy more and better food with fewer hours work than they could in the past.
- Why then have price controls? Is it because the price-controllers want labor to spend its higher wages on luxuries and non-essentials?
- Shouldn't dairy farmers also enjoy higher living standards in necessities, before others buy luxuries at their expense?
- Why is a dairy farmer's labor worth only 69¢ an hour when factory workers earn \$1.56 on the average?
- Why should dairy farmers get only 5% on their capital investment when corporations get up to 15%?
- Why should the farmer get nothing for his managerial ability when business and industry pay high salaries for similar ability?
- Why, in short, do people feel they should buy more and better food than ever before without an increase in their grocery bills? Do they think the food producer is Santa Claus?

Mr. Chapin pointed out that the milk producers opposed only the price and wage controls and agricultural subsidies in the Defense Production acts. They did not oppose proposed amendments to extend authority for allocations, priorities, credit controls and the requisitioning and condemning of property.

*Co-operative*

**ASSOCIATION, INC.**

## WHAT'S GONE BEFORE

Immediately after his marriage to Ann Clinton, Mark Wilson leaves to join Lincoln's volunteers. His brother, Charlie, and his father, George Wilson, follow him into the Army; also Ann's father, Fred Clinton. When Mark becomes involved with the entry into the Union lines of a Southern spy, his mother and Ann journey to Washington to see President Lincoln. They obtain a pardon, and have a glad reunion there with their men. Soon after that, Mark and Charlie come home on furlough, and Mark and Ann quarrel over the question of allowing Henry Bain, a neighboring farmer, to take over the Clinton farm for the mortgage. Mark leaves the next morning without saying goodbye to his wife and realizes too late the grief he has caused her and himself.

## CHAPTER XX

The news of the defeat of Burnside and the Federal forces at Fredericksburg in December, 1862, brought gloom and discouragement throughout the North. To thousands of women like Ann and Nancy, the news of any battle brought an agony of waiting and dread until they could be sure that their men had come through safely.

The short, dark, dreary December days increased Ann's feeling of depression and anxiety. Finally, the blow fell one evening. It happened that she had not made her usual trip for the mail that day, and she and her mother were seated at the supper table when they heard a knock at the door. Without waiting for an answer, John Crawford opened it and walked in. One look at his face brought both women to their feet. Ann knew instantly the kind of tidings he had brought.

"I hate to be the one to tell you this, Ann," he said, gravely, "but a message has just come through from the War Department that Mark was killed in action at Fredericksburg."

"Oh, my God," said Mrs. Clinton, sinking into a chair. But Ann took the blow standing. Her eyes met John Crawford's unflinchingly, though her voice shook as she said:

"Thank you for bringing the message over."

Feeling that he could be of no help to the stricken girl, John turned and went out of the door. Slowly Ann turned back to the table, gripping the back of her chair until the knuckles of her hands shone white in the candlelight, and said to her mother:

"Are you all right? I must go and tell Nancy."

As she made her way up the road to the Wilson home, she wondered why she was not suffering more, not realizing that an emotional shock, like a physical wound, deadens the nerves for a time beyond pain.

The Wilsons were still at the supper table as Ann walked in, and both Enoch Payne and Mary Curtis were there. To offset her own worries, Nancy was slyly promoting the lagging courtship of Enoch and Mary. She was always glad afterwards that those two good friends were there when she and Ann needed strong human support more than ever before in their lives. Numbed by the shock she had had, Ann could do nothing to soften the blow for Nancy and the others. Standing straight and tall, but with stricken face, she stepped just inside the door and said, bluntly:

"Mark is dead!"

There was a moment of stunned silence and then everyone at the table stood up.

"Dead?" said Nancy, incredulously. "Dead, did you say? How do you know?"

"Yes," said Ann, nodding her head mechanically, "he's dead!"

Realizing that the girl was near the breaking point, Enoch went quickly over to Ann, took her by the arm and led her to a chair, while Mary Curtis moved around the table to put an arm across Nancy's shoulders.

"Sit down, Nancy," she said, giving her a gentle push toward a chair. Tom stood leaning on the table, his eyes round, staring at Ann. The little girls, scared, started to cry. That somehow broke the tension.

"Where? How can you be sure?" Nancy said again, groping for hope.

"It happened at Fredericksburg. I don't know how. John Crawford brought the news."

\* \* \*

The days that followed were days of horror for Ann. As the first shock wore off, her suffering increased, and cynically she thought that like most of the old platitudes there was no truth in the one about time making grief easier to bear. With bitter regret and remorse, she kept thinking that if she had done this or that, Mark might still be alive. Why, oh why had she not been more cooperative and understanding when he suggested that they let Henry Bain foreclose his mortgage and that they set up a new home? Ann felt bitter toward her mother, feeling

that she was the cause of a lot of the trouble between her and Mark. It was for her sake that Ann had insisted on keeping the farm.

Thus blaming herself and her mother, Ann's grief seemed beyond her ability to bear. It was all so hopeless. There was something so irrevocable about death. When death comes, she thought, there's never, never another chance for either the living or the dead to make up for past mistakes. And then at times she was comforted by the thought that maybe the dead did have a chance. Maybe they were given infinite power to know and understand what was truly in their loved ones' hearts. If Mark knew, he would forgive all mistakes, remembering only her love.

As she had done before when Mark first left for the war, Ann turned to work as a relief, a surcease from grief. She did all of her own chores; and after Enoch Payne and Tom Wilson had filled a big skidway of logs at her back door, she helped Enoch, sawing and splitting wood until she was so tired that she fell asleep at night too exhausted to think. Protesting at first, Enoch finally realized that work, even to exhaustion, was better for her than her brooding thoughts.

Under different circumstances Ann would have spent much time with Nancy. But now she avoided the Wilson home because there was so much there—particularly Nancy herself—to remind her of her loss. Listening to Enoch's stories and casual talk about practical, everyday matters of the farm and the neighborhood helped a lot. She had a great affection for this old friend.

Henry Bain, too, was frequently at hand during those first weeks of sorrow, talking soothingly to Mrs. Clinton, assuring them both that so far as finances were concerned they had nothing to worry about. His presence occasionally helped to take Ann's mind off her grief, and, in fact, he showed himself so kind and thoughtful and such a true friend in every way that she felt she must change her mind about him. His enemies may be wrong about Henry, she thought.

As time went by, Ann resolved that she must force herself to resume her

old close relationship with Nancy, for after all, Mark was Nancy's son as well as her husband, and it was Nancy's loss, too. Furthermore, Nancy now had further worries, for she had word that her husband was a prisoner of war in a Confederate military prison.

\* \* \*

One winter day Henry Bain drove up in front of the Clinton house with a brand-new Portland cutter, to which was hitched a beautiful brown gelding. After tying and blanketing his horse, he came into the house and said to Ann:

"The sleighing is good, my horse hasn't had enough exercise, and I've got to go over to the Caroline hills on a business trip. Why don't you come along?"

"Oh," said Ann, instantly, "I couldn't."

But her mother intervened.

"Why not, dear? You need a change. It's time you quit moping around."

If Henry had pressed the matter at all, Ann would have continued to refuse, but he just looked disappointed and said something about it's being a long, lonesome trip without company. Her mother kept urging her to go, and finally Ann said, resignedly:

"Oh, all right."

She allowed Henry to tuck the big red-brown buffalo robe around her. Then he climbed in himself, spoke to the lively young horse, which needed no urging, and off they went. It was one of those rare days in a north country winter when the snow sparkled in the sun like millions of diamonds. The glare was almost too much for the naked eye to stand. The air was like wine, and after a while Ann could not help but feel some of the gloom fall away as the runners of the bright new cutter glided easily over the hard packed snow, and the hooves of the horse, as he reached eagerly forward, beat a rhythmic tattoo to the tune of the sleigh bells encircling his body.

For a long time Henry said nothing, respecting Ann's mood and letting the day and the ride have their way with her. After a while they came to the top of a long ridge of hills that separated the two valleys. Henry stopped to give the horse a rest, and they sat gazing over the vast expanse of valley and hills that stretched away below them, sparkling in the sunshine. Ann relaxed with a long sigh, and Henry said:

"Beautiful, isn't it?"

Ann nodded, with a feeling of surprise, wondering what folks would think if they could have heard his remark. Neither she nor any of the others had ever credited him with having any appreciation of beauty. After a brief silence, Henry spoke again:

"Always when I get out like this where I can see the country, it looks to me as if there were more woods than there really are. Look up and down that ridge and the valley below," he said, waving his hand in a wide arc. "Doesn't it look as if there were only a few clearings?"

"Well, there are a lot of woods," said Ann.

"Yes," he agreed, "but nothing like there used to be. When I think of how people used to cut this beautiful virgin timber and burn it just to get it out of the way, it makes me shudder. Lumber is going to get scarcer and scarcer and be worth more. I don't mind telling you that that's why I'm taking this trip today. It's to look at some timberland I want to buy."

Then he added, smugly:

"These fools are anxious to sell their woodland. And I'm getting quite a lot of it without paying much for it."

Realizing that perhaps he had said too much, Henry hastily changed the subject, laughed a little, and said:

"Well, leastwise to look at a piece of timber was one reason why I came. Another was the hope that you'd come along, too."

(Continued from Page 1)

persons in responsible positions both in and out of government. They were merely direct results of price-supporting interference with a free interplay of adjustment, not only between crops and animals but also among the different classes of livestock.

It seems to be not at all widely understood that for six years, since 1944, there has been no increase in food production in the U. S. beyond the 1944 peak of production. Yet during these same six years, the population of the country has increased almost 10 per cent—13 million persons have been added to the food-consuming public.

Only because commercial food exports and foreign relief feeding have decreased, have we been able to maintain the quality of the American diet. In fact, we have not maintained it in full. Since 1946 we have experienced a slow decline in diet quality. We are currently consuming less meat per capita, less dairy products, less fruit, and less vegetables than we were eating three and four years ago. If in 1950 we had eaten as much dairy produce per capita as in 1946 and as much meat per capita as in 1947, we would have had to produce 5 per cent more of each of these nutritionally important foods than we actually did produce. This does not sound like surpluses, and it isn't.

## May Have Food Shortage

Rather than being haunted by surpluses it is much more likely that the food supply of this country may become short in the years immediately ahead—and conceivably we could reach the extremity where somewhat more stretching of our crop output would become necessary.

I take this less than optimistic view

At the recent annual Steuben County, New York, Dairy Banquet, 80 herds were cited for notable herd production. The herd of Mrs. Edith Conner of Avoca, N. Y., (above) topped all DHIA herds in the County in 1950 with a herd average of 498 pounds of butterfat.

Walter Sturdevant & Son, Prattsburg, topped the lifetime class with a record of 5,000 pounds of butterfat on a grade Holstein cow named "Twinkle." Other top herds were those of Eldon Paddock of Pulteney, Robert W. Ainsworth of Rexville, Forrest Leach of Jasper, Ted Flanders of Hornell, Robert Flanders of Arkport, and Thomas Kane of Addison.

of our national food position for three reasons:

First, it seems highly unlikely that weather conditions across the country will remain as favorable for the years immediately ahead as has been the case over the past decade.

Second, the population of the country gives every prospect of continuing to increase for several years to come at a rate of about 1.5 per cent per year. This alone would require a corresponding increase of 1.5 per cent per year in food production if the present diet level is to continue.

Third, to state the case mildly, we are again in an international emergency. We are arming for defense and—God forbid—we may be close to war. This situation is certain to place additional demands upon our food supply—how soon and how much no one can know.

## Equipment and Supplies Essential

Never before has American agriculture operated in an economic balance so delicate. Produce prices and the availability and cost of supplies can affect production much more than in earlier decades. Never before have farmers been so dependent upon urban-produced goods and services. As illustrations we have only to note the degree to which agriculture is now dependent upon machinery powered with petroleum, and that about a third of our farm output rests upon chemicals in the form of fertilizers and pesticides.

In these days of allocations, agricultural groups must work increasingly through government committees to get the machinery, spare parts, containers, fertilizer, pesticides, twine, wire, gasoline, and many other items that are absolute essentials to full production. Consequently the attitude of the public which will prevail toward agriculture may become crucial. And against the critical need for wide understanding of farm and food problems stands the unfortunate fact that agriculture's public relations have never been worse.

## Consumers Unsympathetic

The American people, for the most part, know little about the food economy of the country. But, in a large measure, those of us who speak for agriculture have failed in our responsibility for education and public understanding, just as we have failed in keeping politics out of our national food and farm policy. In consequence, public sentiment has come to be more against than with farmers and their problems.

This would not hurt farmers especially, if we were now operating in a free market—because in a free market everyone can hold up his head and tell the other fellow to go learn what the score is. And if the other fellow does not do so, he is the one who will get hurt. But in a controlled market, in a centrally directed economy, where authority over prices and allocations is vested in government boards and committees, nothing can be expected except that these agencies will bow to the strongest public pressures.

Too few city people realize that their jobs and the kind of food they like to eat are dependent on a sound and flexible agriculture, and that the surest way to bring a Chinese diet to America is to inaugurate controls that stifle production. Somehow we must make the consumer understand this for his sake as well as the farmer's.

# If a Cow's Worth Milking She's Worth Milking Right..

## ...The SURGE Way

**SURGE** milks cows faster without hand stripping

**SURGE** is much easier to clean, and therefore it's easier to produce clean milk

**SURGE** has that *Tug and Pull* that keeps teat cups from creeping up, preventing injury to the udder

**SURGE** gets MORE MILK IN LESS TIME FROM THE SAME COWS because SURGE *TUG AND PULL* stretches and empties the udder

**YES, SURGE DOES MEAN MORE PROFITABLE DAIRYING FOR YOU! PROVE IT TO YOURSELF...**

Ask your SURGE dealer to come to your farm and demonstrate the new SURGE.

**ASK FOR FACTS!**

## DOWN THE

By J. F. "Doc" ROBERTS

To our Senators and Representatives in Washington, D. C.  
Honorable Sirs:

Have you noticed that the people back home have stopped laughing? Words and phrases such as, "I want to be a captain"; "mink coats"; "five percenters"; "price manipulations"; "R.F.C."; and "special privilege politics," are no longer funny. In fact, it's become very serious business, not only to a few but to everyone.

Did you notice how the people flocked to the support of General MacArthur? They were not Republicans or Democrats, although Washington seemed to think so. They rallied to a clean, good man, knowing that they were not in a position to know whether he was right or wrong, but they loved his willingness to put what he thought was best for his country ahead of self or politics.

### "Fed Up"

Did not Senator Taft prove last November that folks are completely "fed up" with leaders of any kind who have already, or even may, put their interests or the interests of their group ahead of all the interests of people in the United States?

Have you talked with men and women outside of the Washington scene? Have you observed and heard their loathing, disgust, and contempt of the things that have been going on in Washington and other cities through politics? Have you found anyone who would even make an attempt to justify what has been going on, except in Washington itself?

People are so disgusted with this situation that they have thrown up their hands, shrugged their shoulders and said, "What's the use?" Then 50 per cent of them vote; the other 50 per cent have completely lost interest except when a MacArthur incident comes up, or a Senate Crime Commission shows them on television that perhaps there is still hope.

Now we are faced with all sorts of black markets. Every legislator knows that just as well as every citizen. They also know that black markets lead right into every home, where even children are exposed to chicanery of some sort with loss of respect for law and order and loss of respect for the legislators who have allowed it to become possible. Do you realize the moral scope which black markets cover?

Now, Mr. Legislator, you can prove all of this by spending a little time with any of the folks in every walk of life in your own or any other district outside of Washington, D. C. Today you have your greatest opportunity to become a true leader and revered statesman. Put your country first; throw the rascals out, and then on June 30 eliminate deceiving our people with so-called price controls for votes. Your opportunity is here and now.

### Stop Wasteful Spending

Of course, no farmer wants inflation, especially with his vested interests as compared to many groups. Neither do they want unprotected homes. They know, and you know, that when the government taxes and spends billions, much of it wastefully, this is the real cause of inflation, and these demoralizing taxes and wasteful spending must be stopped, and that Washington is the place to stop it. Throwing the country into controlled food prices with a variation one way or another

of a "few cents a pound," cannot eliminate inflation. Controls can only pass one man's earned dollars to some one else who has not earned them.

The opportunity is yours, Mr. Honorable Legislator. If you will fight for America first, you will be surprised how America will rally and fight for you. Your country needs you now. You, and you only, can clean up this mess.

Yours sincerely,  
"Doc"

## DR. BLOOD RE-ELECTED AYRSHIRE ASSOCIATION HEAD

At the recent 76th annual meeting of the Ayrshire Breeders Association, Dr. Robert O. Blood of Concord, N. H., was re-elected as president. Other officers elected include: Henry B. Mosle, Litchfield, Conn., as first vice president; Charles R. Rodriguez, Cropseyville, N. Y.; William Core, Franklin, Ind.; and Robert Eno, Honesdale, Pa., as vice presidents.

G. Fred Williams, Hutchinson, Kans.; Lyle Arnold, Canandaigua, N. Y.; Bruce Nickless, Caledonia, Mich.; Dr. E. C. Deubler, Newtown, Pa.; and Philip Schuyler, Cobleskill, N. Y., were re-elected to the Board of Directors. Newly elected Board members include Robert L. Knight, Hope, R. I.; H. H. Dodge, Frankfort, N. Y.; and Herbert Kimball, Haverhill, Mass.

At the annual banquet Clifford Conklin, who has been executive secretary of the Association for 26 years, was honored with the Association's Distinguished Service Award.

A new attendance record was established with some 600 Ayrshire Breeders present.

— A.A. —

## 265th EARLVILLE SALE

One hundred twenty-one buyers paid \$112,000 for 284 Registered Holstein Cattle in the 265th Earlville Sale on May 2 and 3. These buyers were from 35 counties in New York State, from Mass., New Jersey, Michigan, New Hampshire, Penna., Vermont, Connecticut, and Delaware.

Three cows sold from \$1000 to \$1150 and 94 milking cows averaged \$487; 40 Bulls-\$318; 111 Bred Heifers-\$388; 22 Open Heifers-\$208.

— A.A. —

Where a cow has free access to good grass silage, she will eat as much as 100 pounds in 24 hours.

## New Hampshire Jerseys DISPERSAL SALE

The Gabriel Elder Herd of 37 Head at the Farm in Etna, N. H.

Wednesday, June 13, 1951 at 1 P. M. DST

A top herd with production records, good pedigrees, and good type in top form. Sale includes the Senior herd sire and his 11 daus. He is by Brampton Royal Basil, Excellent Sup. Sire son of Brampton Lady Basilua. The Jr. Herd Sire is by the Sup. Sire, Juggler's Tycoon out of a Ton of Gold cow. There are seven daus. of Major Perk, a half brother to Sibley Farms great Nat'l. record cow, Lex Deborah. One of these has a DHI record last year of 545 fat. There are daughters with records up to 11,000 milk, 566 fat of Juggler's Tycoon and Duke Beau Gipsy. Also daughters of Tested Dams and Tested Sires (some with over 600 lb. ave.) and Gold Medal cows. These cows are ready to milk for you and won't have to be conditioned. Last year's DHI ave. on this hill farm was 424 fat. Just a farmer's herd that pays out. Catalogs on request to:

Tom Whittaker, Auctioneer  
Brandon, Vt.

George Ricker, Sales Mgr.  
Groton, Vt.

Etna is 7 miles from Hanover, N. H. Signs from Rt. 120 near Hanover. Sale under cover and lunch available.

## Seventh Annual Eastern Regional Jersey Sale

at DUKE FARMS — SOMERVILLE, NEW JERSEY

on SATURDAY, JUNE 16, 1951

THE SALE OF THE YEAR IN THE EAST. Where fifty-five head of select Jersey females will sell at auction. These animals have been carefully selected from the herds of the leading Jersey breeders of the East with high requirements for both type and production. ## "Windgall? Use ABSORBINE"

says Gustave Troutman, of Milton, N.Y.

"I've been a farmer for 40 years and all that time I've used Absorbine for my horses. I've found it quickly relieves strain and soreness from windgall."

Yes, farmers know there's nothing like Absorbine for helping to relieve lameness due to windgall, sore shoulder, fresh bog spavin and similar congestive troubles. Not a "cure-all," Absorbine is a time-proved help . . . used by many leading veterinarians, too, for helping to relieve puffs, strains and bruises.

A stand-by for 50 years, Absorbine will not blister or remove hair. Only \$2.50 for a long-lasting bottle at all druggists.

W. F. Young, Inc., Springfield, Mass.

## ASPARAGUS • STRAWBERRIES • RHUBARB •

**S**PRING'S three best gifts — asparagus, rhubarb, and strawberries — make a wonderful start for the canning and freezing season. The first thing to do is to see that all the equipment is in order. Test the pressure cooker and have on hand an adequate supply of jars and jar rubbers, paraffin, freezing boxes, bags, tape, etc. Organize the job ahead of time so that everything will go quickly and smoothly.

### Canning Asparagus

Can only young, tender asparagus. You will need about 1½ pounds for each pint jar. Sort the asparagus according to size. Cut off the tender portion of the stalks and remove the coarse scales. Wash the stalks thoroughly.

Cut the stalks so they are just long enough to stand upright in the jar; tie them in bunches (20 to 30 stalks to a bunch). Blanch by standing the bunches, tips up, in boiling salted water (1 tablespoon salt to each quart of water) to cover all but the upper third of the stalks; boil for 3 minutes, then tip the bunches over on their sides and boil for ½ minute longer.

Remove the bunches and cool in cold water for about 1 minute, or until they may be handled easily. Pack the stalks in clean, hot jars with the tips upright, except for 3 or 4 stalks in the center which should be packed tips down (this helps to keep the stalks whole when removed). Add ½ teaspoon salt to each pint jar, and cover the asparagus with boiling water. Seal the jar according to

By

ANNA ROGERS WILLMAN

type of jar used. Process at 10 pounds pressure: pint jars, 25 min.; quart jars, 35 min.

### Freezing Asparagus

Use tender, fresh young stalks, since woody, fibrous asparagus does not make a satisfactory frozen product. Trim all stalks to 5-inch lengths. (The tender part of the stalk bottoms may be cut into 1 inch pieces, scalded, and frozen for soup.) Thoroughly wash the stalks in running, cold water. Remove the scales with the tip of a knife if there is dirt underneath them.

Sort the spears according to the diameter of the butt end. Discard for freezing any that are more than 1 inch in diameter. Scald the stalks up to ¾ inch in diameter in boiling water for 3 minutes; scald the stalks ¾ to 1 inch in diameter for 4 minutes. Use at least 1 gallon of water for each pound of asparagus. Scald only small amounts at a time. The scalding time is counted from the time the water returns to a boil (water should boil again in not more than 1 minute).

Cool the scalded stalks immediately in very cold, running water. Remove them from the water as soon as they are thoroughly cool, and drain well. Pack the stalks parallel, with the heads in alternate directions. Trunk

Strawberry Jam and jelly are always good, but for a change try Strawberry and Rhubarb Jam. It's delicious and different.

style boxes, or a sheet of cellophane or moisture-vapor proof material may be used. Seal the packages. Freeze and store.

### Freezing Rhubarb

Rhubarb with tender, deep-red stalks makes the most attractive frozen product. Cut off the leaves and wash the stalks in cold water. Cut the stalks into 1 inch lengths. Hold several stalks in a bunch and slice through them in one stroke.

Now you have a choice of freezing methods:

1. Pack the pieces, freeze and store.
2. Scald the pieces in boiling water for 1½ minutes, cool, package, freeze and store.
- \*3. Scald, as above, cool and pack, cover with a 65% sirup (9 cups sugar to 4 cups water), freeze and store.
- \*4. Cook the rhubarb in a 65% sirup; cool. Using a strainer, lift the pieces from the sirup into the box; cover with sirup; freeze and store.
5. Make rhubarb sauce by your favorite recipe. Cool, package, freeze and store.

(\*If sirup is used, make it a day ahead, cool and hold it in the refrigerator until it is needed.)

### Rhubarb Juice

Rhubarb juice is delicious as a fruit drink, and makes an excellent base for punch, or fruit gelatin salads and desserts.

Cut off the leaves, wash stalks in cold water, and cut in 1-inch lengths. Place the rhubarb in a kettle, add a small amount of hot water and cook until soft. A double boiler, or low heat gives the best flavor. While still hot, extract the juice. This may be done by pressing through a special juicer, sieve, or jelly bag.

Add ½ cup of sugar to each quart of juice. Heat rapidly to 170°F. Without a thermometer, one may bring the juice

to just barely simmering. When the juice reaches the pasteurizing temperature, pour it immediately into hot sterilized (recently boiled 10 minutes) jars or bottles. Fill to overflowing, remove any foam, and refill with juice. Seal completely, and process in a hot

You can make quick work of cutting up rhubarb by holding several stalks in a bunch and slicing through them in one stroke.

water bath at 175°F. to 185°F. for 5 minutes.

Remove the containers and place in lukewarm water for 5 minutes. Finally the containers should be cooled in the coldest water available. Cold water may be run into the hot water until it is cold, but the cooling must be gradual to prevent the breakage of glass. After cooling, label the juice, and store in as cold a place as possible.

### RHUBARB CONSERVE

- 4 cups rhubarb
- 4 cups sugar
- 2 tablespoons grated orange rind
- ¾ cup orange juice
- ¼ teaspoon salt
- 1 cup chopped nuts (walnuts)

Cut the rhubarb into ¼ to ½ inch slices. Combine all ingredients, except the nuts, in a large saucepan. Heat slowly, stirring constantly until all the sugar is dissolved. Bring the mixture

to a boil and boil *rapidly* until the mixture is thick, stirring occasionally. Stir in the nuts and pour into hot sterilized half-pint jars, or jelly glasses. Seal with lids or paraffin.

### Freezing Strawberries

Strawberries lose quality very rapidly, so use all possible speed from patch to freezer. Use firm, fully ripe berries.

Wash the berries in very cold water, sort and cap. Slice in pieces ¼ inch thick, or cut in half lengthwise, or chop into pieces about the size of a quarter berry. The sugar may be varied according to personal preference or the tartness of the berries: 1 part sugar, by weight, to 4 parts, 5 parts, or 6 parts of berries, by weight.

Mix the berries and sugar together thoroughly. Package, freeze promptly and store.

### STRAWBERRY JAM

- 4 cups strawberries (prepared fruit)
- 3 cups sugar

Wash the strawberries and discard any that are spoiled or discolored. Crush, cut or chop them. Measure the berries into a large saucepan, and add the sugar. Heat the fruit and sugar slowly, stirring constantly, until all the sugar is dissolved. Bring the mixture to a boil and boil *rapidly* until it is thick, stirring occasionally. This will require only a few minutes. (It is better to slightly undercook than to overcook strawberry products, since their flavor, color, and consistency are harmed by too much heat.)

Take the jam off the stove, cover, and let it stand for 2 minutes. Skim if a foam is present. Stir the jam and pour it into hot sterilized jars (you will need about 4 half pint jars), and seal with a thin layer of melted paraffin. After the jam is cold, pour on more paraffin, making sure there is a good seal with the sides of the jar. Wash, cover and label the jars. Store in a dry, dark, cool place. Yield: about 1 quart jam.

### STRAWBERRY AND PINEAPPLE JAM

To the strawberry jam recipe, add: 2 cups cooked, finely shredded pineapple 1½ cups sugar

Proceed as in the directions for strawberry jam.

### STRAWBERRY AND RHUBARB JAM

- 3 cups strawberries
- 1 cup finely diced rhubarb
- 3 cups sugar

Proceed as in the directions for strawberry jam.

Delicious strawberry jam may also be made with commercial fruit pectins, and results in a larger yield of jam. Recipes usually come with the pectin, but here is a satisfactory one for jam:

### STRAWBERRY JAM

- 4 cups prepared fruit
- 7 cups sugar
- ½ bottle fruit pectin

Crush thoroughly about 2 quarts fully ripe strawberries. Measure 4 cups into a large saucepan. Add sugar to fruit in saucepan and mix well. Place over high heat, bring to a full rolling boil, and boil hard 1 minute, stirring constantly. Remove from heat and stir in bottled fruit pectin. Then stir and skim by turns for 5 minutes to cool slightly, to prevent floating fruit. Pour quickly into glasses. Paraffin at once. Yield: about 10 glasses, six ounces each.

IT'S NEWS!

# CHEER

Procter & Gamble's  
**NEW**  
Washday Marvel

## No matter what soap you're now using— **cheer** guarantees a cleaner, whiter wash!

Today there's something better than *any* soap—new CHEER!

Chances are the soap you're using now is a perfectly good one. But this new washday marvel gets your wash *cleaner* and *whiter* than any soap will!

That's a pretty big promise. But if you'll try CHEER *just once*, you'll prove it *at every washing step!*

*Next washday you be the judge!*

**1. Prove CHEER's guarantee—in your washing machine!**

You'll marvel at the way new CHEER's thick suds billow up—even in *hardest* water! CHEER gets right to work removing greasy, grimy dirt. No bleaches, bluing, or water softeners needed.

**2. Prove CHEER's guarantee—on your washline!**

After rinsing and wringing, *see* how gloriously clean, how radiantly white CHEER-clean clothes are, waving on the line! And CHEER *is safe* for colored washables . . . *kind to hands!*

**3. Prove CHEER's guarantee—on your ironing board!**

CHEER leaves no soap film to yellow under the iron's heat. Clothes not only wash and dry cleaner and whiter . . . *they iron cleaner and whiter*—or your money back!

Get CHEER in the convenient Giant Economy Size package

**P.S. Wonderful  
for NO-RINSE  
washing, too!**

If you wash without rinsing, no washing product on earth will give you a cleaner wash than CHEER. CHEER will give you the cleanest no-rinse wash it's possible to get.

**"Clothes dry so fresh  
and sweet-smelling  
you'll want to hug them!"**

**Try cheer once...  
and you'll cheer forever!**

## More Get-Up-And-Go with Domino!

Domino Sugar provides the kind of vital food-energy your family needs every day. Help keep your husband on the job, active and vigorous—your children full of pep and vitality. Give them Domino Sugar—pure food-energy in its most concentrated form!

Only **ONE** Sugar is  
**Domino Pure!**

## Wake Up To More Comfort

Without Nagging Backache

Nagging backache, loss of pep and energy, headaches and dizziness may be due to slow-down of kidney function. Doctors say good kidney function is very important to good health. When some everyday condition, such as stress and strain, causes this important function to slow down, many folks suffer nagging backache—feel miserable. Minor bladder irritations due to cold or wrong diet may cause getting up nights or frequent passages. Don't neglect your kidneys if these conditions bother you. Try Doan's Pills—a mild diuretic. Used successfully by millions for over 50 years. It's amazing how many times Doan's give happy relief from these discomforts—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

**RAW WOOL WANTED**  
Montgomery Worsted Mills, Inc.,  
Montgomery, Orange County, New York

Little Essie Elliott of Ithaca, N. Y., stuffs her winter scarf into a cellophane freezer bag, her mother uses a warm iron to seal a bag of woolens and moth crystals.

## Safe Summer Storage FOR WOOLENS

**F**RUIT jars and cellophane freezer bags make good moth-proof containers for wool mittens, socks, and scarves, say specialists at the New York State College of Home Economics. They provide reasonably airtight storage, and since you can tell at a glance what's in them, you don't have to label them.

Rule No. 1 in protecting woolens from moths is to see that all articles are thoroughly clean before being stored. You'll also need moth-killing crystals. A good moth-killer and repellent is para-di-chloro-benzene, a crystalline substance sold under many brand names but usually identified as such on the package. Put these crystals on top of the article you are protecting, as their moth-killing fumes are heavier than air and seep down through garment.

When storing small articles in fruit jars or cellophane bags, lay a cheese-cloth bag filled with the crystals on top of the article. Use clean jars, and a jar rubber to be sure the jar is tightly closed. If using cellophane freezer bags, seal with a warm iron. Store in a moderately cool, dry place.

Sweaters may be washed and stored in boxes or wrapped in strong wrap-

ping paper. Close all open edges with gummed tape.

### Large Woolen Articles

The same principles apply to storing large woolen articles: They must be thoroughly clean, they must have airtight storage, and they must have moth-killing crystals to protect them. Sometimes it's difficult to find just the right containers, or enough of them, for safe storage of wool dresses, suits, coats, etc., but the college specialists offer a good suggestion. They recommend a brand new garbage can for flat storage. Line it with paper, and lay clean woolen garments in it. Sprinkle

para-di-chloro-benzene crystals between layers of the clothing, and put a generous sprinkling on top of the pile. When putting in the crystals, it's a good idea to sprinkle them between folds of tissue paper. Close can tightly and store in moderately cool, dry place.

Here are some other good storage suggestions from the college:

**Cloth Coat with Fur Collar:** Brush and air in sun, and have cleaned if necessary. Store in airtight bag with a bag of para-di-chloro-benzene crystals suspended from the top of the hanger. Seal bag tightly with gummed tape. Store in moderately cool place, as heat would dry out the fur.

**Winter Felt Hats:** Brush, air, and sun. Store with para-di-chloro-benzene crystals in tightly sealed hat box.

**Moth-proofing Clothes:** If you use a spray to moth-proof your clothes, be sure to read and follow directions that come with it, and remember that the solution must come in contact with all parts of the garment. However, with a moth-proofing solution, clothes needn't be stored in airtight containers.

**Cedar Chest:** When storing wool garments or blankets in cedar chest, make sure that they are thoroughly clean and, to be on the safe side, add some para-di-chloro-benzene crystals.

## Easy to Make

**No. 2448.** This cute playsuit is twice as practical, for it has a matching, ruffled-sleeve dress that daughter can don in a second for the street! Sizes 1, 2, 4, 6. Size 2 dress, 1½ yds. 35-in. The playsuit, ¾ yd. 35-in.

**No. 2446.** New, flattering lines with a single large pocket and the side buttons ending in a pleat. Try shantung or linen. Sizes 12-20, 36-46. Size 18, 3¾ yds. 39-in.

**No. 2415.** "Easy" is the best word for this shoulder button cotton—it's easy to make, easy to wear. The shaped midriff is slenderizing. The scallops are softening. Sizes 10-20. Size 16, 4 yds. 35-in. fabric.

**No. 2418.** The newest slim sleeveless success—neatly yoked—and a sheltering bolero to turn it into a smart street costume! Sizes 12-20, 36-44. Size 18, for dress and bolero, 6¼ yds. 35-in.

**TO ORDER:** Write name, address, pattern size and number clearly. Enclose 25 cents for each pattern wanted. Add 25 cents for our Spring-Summer Fashion Book which has attractive pattern designs for all ages, sizes and occasions. Send to **AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.**

## NO DRUMS

(Continued from Page 14)

When Ann made no reply to this remark, Henry continued after a moment:

"You know, Ann, I haven't changed my feelings about you in a long, long time—not since I began to realize how nice you are—and I never will," he added, emphatically.

Ann looked at him and said, kindly:

"That's too bad, Henry, when there are so many nice girls. You've been so very kind to Mother and me that I never will forget it. But, please, Henry, I just don't want to talk about such things."

After supper that evening Ann, feeling much better for her outing, decided to visit Nancy. It was getting dark when she opened the door and stepped into the Wilson kitchen, and in the dusk she was surprised at first glance to see a stranger turn toward her, with the family all gathered around him. Then she recognized her father-in-law, and rushing forward she threw her arms around him. Standing back to look at him after her embrace, she exclaimed:

"No wonder I didn't know you!"

Since Nancy and she had seen George in Washington he had lost twenty pounds. His thin face was covered with a scraggly beard, and he was not wearing his uniform. He had just arrived on the evening stage.

After the first excitement of greeting him was over, they gathered around to hear his tale of sad experiences, but he touched upon them only briefly and lightly. Then followed the inevitable silence as they all thought of their loss. Since the news of Mark's death, Ann had received a brief letter from the Captain of his company, expressing his great regret to have to be the conveyor of such sad news. He added that he could give no particulars except to say that a comrade of Mark's had seen him fall in one of the charges at Fredericksburg. "Apparently," the Captain's letter concluded, "no one was able to identify your husband, so the Adjutant General's office will not be able to forward any of his personal belongings."

"I haven't seen much of you lately, Ann," said Nancy. "I know why, and I understand. But I've wanted to talk something over with you. Now that George is home—" she stopped because her voice was trembling so much—"and we have all the news we'll ever have of Mark, I think that we should have a memorial service for him."

George stood up and put his arm over his wife's shoulder:

"Yes, my dear," he said, "we will. We'll talk with Mr. Belden about it tomorrow."

A week later the church at Jenks-town was packed with the friends and neighbors who came to do honor to the memory of Mark Wilson and, through him, to the living and the dead who fought to save the Union. Flags draped the pulpit as Timothy Belden rose to ask them to bow their heads in prayer. Gritting her teeth for self-control during the preliminary part of the service, Ann kept thinking of the time, not so long ago, when she and Mark had sat together almost in this same front pew and endured the hymns and the sermon until they could stand up together and be married. What was life all about anyway? What was the use of living? she asked herself now.

Then she became conscious of the old man in the pulpit talking, and it seemed somehow that he was talking directly to her and to all the other tortured and worried hearts within the sound of his voice. Almost unconsciously she began to listen, and as the soothing, kindly voice of her old friend went on, she began to relax and to get some measure of comfort.

"We don't know why it is," the pastor said, "but mankind has always been afflicted with sorrow, and no doubt always will be as long as time shall last. We do know—and that is our comfort—that God is always on His throne, and that He in his infinite wisdom has a plan; and if we can just have faith, some day we will have the answer. It will be the right one, and we will know that His plan, even though it brought us sorrow and suffering, was right. Don't forget, that we here are not the only ones who suffer. Today this is a stricken land, North and South. Thousands of families are having this cross to bear; thousands more will before the war is done. It seems an awful thing that men have to settle these great issues by the sword, but perhaps, just as the surgeon uses his knife, so God may use the awful instrument of war to bring about his purposes in the shortest time and with the least permanent cost.

"To me, God's purpose in permitting this awful war seems plain. Our fathers believed that they had found something in this American democracy that was infinitely precious, far beyond the value of life itself. And they fought for it, just as Mark Wilson fought for it and gave up his life for it. What is this thing we call democracy? What is it our fathers thought they had? Is it just a meaningless high-sounding word?

"To answer it, take a look at the Old World before the landing of the Pilgrims. Slavery was world-wide, in most countries women were not much better than slaves. The home as we know it today did not exist, education was confined to monasteries and to a few in the upper classes, freedom of worship did not exist. Those who tried to worship according to their conscience were persecuted, there was little or no political freedom, government was based on "the divine right of kings," which meant that the individual existed solely for the state, not the state for the individual. Might always made right, oppression and taxation stalked the land, privation and suffering were the common lot.

"Those were the conditions that the Pilgrims, the Puritans and the other New World emigrants left behind them. Do you wonder that they gloried in their new-found freedom, in the opportunity in the new air of a new world for the individual soul to flower? These first American settlers knew from actual bitter experience what they had escaped from in the Old World. They never forgot it, nor permitted their children to forget the blessing of liberty. That bitter experience and the glory of new-found freedom were common talk in every American household for generations. To our fathers, this America which we fought to preserve was a synonym for true religion founded on the fatherhood of God and the brotherhood of man. It was a synonym for political freedom, the right to elect or appoint their own leaders—and to put them out when they failed.

"That, my friends, is our heritage. That is what we are trying to preserve in driving slavery from the land and making this country truly free, one country undivided, with liberty and justice for all. With all of our suffering and tears, let us keep our faith in our cause and in God's wisdom shining here like the stars of a summer night."

The intensity went out of the earnest old voice. He paused, and then, speaking in the gentle tones that Ann knew so well, the minister continued:

"It is not my purpose to prolong the misery of those closest and dearest to Mark Wilson by eulogizing him. Sufficient to say that he was your friend and my friend, fine in every way, and he gave his life for our country. No man can do more."

(To be continued)

## Buy Zenith Quality Radio

...with Static-free FM at its finest, plus Long-Distance® AM

### New Zenith "Super-Triumph"

For AC or DC—in Maroon plastic

The radio you buy now must not only be advanced in performance, but *quality-built* to last! These brilliant table radios are both—and prove it. Their Super-Sensitive Zenith FM reaches far beyond the usual range, frees you of "summer static" annoyance forever, plays where ordinary FM and AM fail! And they're built to the same Zenith *controlled-quality* standards as the millions of Zeniths that have served their owners for 10, 20 years and longer! Don't gamble with parts replacement and service problems. Make sure *you* get quality you can trust—Zenith Quality!

New Zenith® "Super-Symphony," Super-powered with giant 7½ in. speaker, for most sensational tone and reception ever in a Zenith table radio. AC-DC. Walnut plastic.

### FM Set-Owners:

Don't miss the fine programs offered by FM stations of the Rural Radio Network, including the famous

### WQXR Concerts

of classical and semi-classical music plus hourly news reports prepared by the New York Times, now broadcast 7:30-11:06 p.m. Mondays thru Saturdays and 3:00-11:06 p.m. Sundays. The excellence of these programs deserves the superior clear-toned, static-free reception provided by super sensitive Zenith FM.

## AT HAYFIELDS

By TOM MILLIMAN

### 1951 LINEUP

From time to time on this page you'll be reading of happenings at Hayfields. As a background for comments to come, here's our layout and prospects as of mid-May:

Cows, milking and dry.....	44
Bred heifers .....	22
Unserved heifers and calves .....	28
Service bulls .....	3
Bull calves to lease .....	3
Bulls leased to others .....	20
Steers for farm meat .....	3
<b>Total cattle .....</b>	<b>123</b>
Acres, Peas (cash crop) ....	12
" Wheat (cash crop) ..	40
" Corn (3 uses) .....	42
" Hay (3 uses) .....	80
" Improved pasture ....	48
" Oats (4 uses) .....	40
<b>Total effective Acres .....</b>	<b>262</b>

In addition we have some so-called pastures on a hill too steep, and in two swamps too wet, to plow or disk. Such acreage is considerable but the yield is very low, and it shouldn't be listed as really useful land. As a contrast, some important midsummer and early fall grazing is obtained from the aftermath on certain hayfields.

The three uses for hay are in the order of importance with us: grass silage—baled hay—aftermath grazing.

Our three uses for corn are, also in the order of their importance: grinding dry ears for feed—corn silage—selling as shelled corn what is left over.

Counting straw as one of the four, the other three uses of oats are, in order of importance, grain and new seeding—pasture and new seeding—grain without seeding, stubble to be disked for wheat. No oats are sold. The oats for grazing are included in the 48 acres of improved pasture but not in the oats acreage.

In the absence of desired artificial insemination from Angus bulls, our three steers are crossbreeds within dairy breeds. Four families have their sights set on late November when the biggest steer is supposed to be ready. He'd better start making like a beeper, but is more likely to keep on growing instead of fattening up as would a halfblood Angus.

The 12 acres of peas are listed as a cash crop, although they are grown largely to provide ideal seeding conditions for new alfalfa. Granted rain, we expect a little light grazing of alfalfa after peas in late August or early September, and should have available for recovery from the vegetable freezing company around 40 tons of peavine silage in the winter.

### HORSE SENTIMENT VS. BUSINESS

ON this page in the November 4, 1950, issue of AMERICAN AGRICULTURIST, there appeared a picture of a beautiful team of Belgian geldings. The caption beneath was entitled, "The Last Team Doesn't Leave," and went on to state that when a young farmer offered \$250 for the team with harness, and later begged off, my spirits rose. In an effort to hide sentiment and to make the decision seem practical the caption ended with these words, "Who knows

but what a team of horses may be priceless should the flow of gasoline and repair parts be interrupted."

It hasn't worked out. The team was properly left outdoors all winter and fed on the cowbarn sweepings tossed out of a rear door into their pasture. We all suspect the horses gnawed too closely the fairly new four-acre patch of Birdsfoot Trefoil. By cavorting all over it, they have certainly raised hob with a 3½ acre patch in the same hill pasture, newly seeded this spring to oats-birdsfoot-timothy.

We could put up with all that. But when the men logically began to refer to them as the "blasted" horses, due to the fact that the team stood nearby waiting to trot out of a pasture gate which has lately had to be opened frequently, I gave up. The recollection that no one would volunteer without urging to drive the team on the remaining two pieces of horse equipment, probably helped the decision.

### Team Goes Where Needed

Donald Clark and Roy Byington, farm neighbors living near Rushford, Allegany County, N. Y., heard about the team through Marion Nobles of Hayfields, drove the 50 miles and made an offer of \$250. It was first turned down, then accepted. Messrs. Clark and Byington came with a truck on Sunday, May 6. When we had the horses rounded up and standing in a barn side by side, the buyers' eyes shone with the pleasure which all horse lovers have on acquiring something really choice. One other pair of eyes glistened for a different reason and an excuse was invented to look up something in the cowbarn adjoining.

### APRIL 28, 1951

AT THIS point 20 miles South of Lake Ontario, the milking cows went to pasture for 2½ hours the afternoon of Saturday, April 28, and were left out for 5½ hours the next day. Turning out time was determined by the height and strength of the orchard grass in a 16-acre field which is to grow corn this year. For three years this field yielded bounteously of orchard grass-ladino-alfalfa. The legumes are now mostly gone, hence the decision to plow for corn in May.

In 1950 we turned out on April 26, in 1949 on April 21, in 1948 on April 28. In each of these three years the growth of orchard grass and of ladino required grazing on the dates given. However our new orchard grass pasture, seeded last year, was not ready until May 4th this year, showing that the spring of 1951 is running later than the spring of 1948 when the one year old seeding was ready six days earlier. Surprisingly our brome-ladino-alfalfa is coming along only about five days behind the new orchard grass combination, thus throwing out of gear our prediction of 10 days difference.

### Neighbor Does Better

During a journey from Ithaca on Friday, April 27, to Hayfields, 100 miles away and then on another journey of 35 miles to higher land southwestward in Genesee County, no milking cows were seen at pasture and very few young stock were outside of barnyards. On Sunday, April 29, when the cows went out for the second day to the old

orchard grass, we all felt pretty good about it; in fact as we talked it over, a self-satisfied attitude crept into our conversation.

It was short lived. The news came that Ethan Clark's cows and young stock had been grazing orchard grass-ladino-alfalfa for more than a week ahead of ours. A visit to friend Ethan six days later confirmed the news. By that time he had taken the milking cows out of the first electrically fenced section of orchard grass and put them in another field of the same.

Mr. Clark's cows looked fine and sleek and had by May 5th come up very pleasingly in their milk production. His soil is a little lighter and better drained than ours. These advantages plus a southward slope, while ours slopes a little to the north, provide him with greater earliness. If ever again we feel chesty about anything, we shall quickly look for an Ethan Clark and are sure to find him, probably close by.

### More and Cheaper Milk

The increased flow of milk brought on by extra early pasture more than pays, each year, for three years' fertilization of the same pasture. This is said without taking credit for a reduction in feeding of grain, hay or silage, and the lessened amount of labor involved. Then too, orchard grass pasture will yield noticeably better in mid-summer. It can be counted upon for a greater total production for the grazing year than any other grass now used.

But to the livestock man who becomes enthusiastic about orchard grass and proposes to establish a great deal of it, painful as the admission is, it may be helpful to state that it took Hayfields 15 years to learn that a little orchard grass goes a long way. Limited acreage under tight control (one acre to 4 or 5 cows) makes the most profitable pasture on the farm, even as unlimited acreage makes the most unprofitable one. Cattle won't eat tall orchard grass, and the uncontrolled grass will run out the legumes in a hurry.

### PLASTIC SILAGE CAP

A MONTH ago, this page was devoted entirely to grass silage, its great merits, and the pros and cons of preservatives. There was no room to include a statement on the use of a modern silage cap for the preservation of top ensilage.

We have at Hayfields, two steel glass-lined airtight silos, self-discharging by means of a bottom unloader. These silos being airtight, prevent spoilage and require no seal or cap at

the top. But our old and still very good tile silo will also be filled with grass this June. It will be sealed off with a circular covering made of plastic. This cap, together with a water-roll of the same material, cost \$47, and worked perfectly in 1950. In the fall after the grass silage has settled, the cap will be removed in a few minutes by one man, the silo refilled with corn and the cap again placed.

These plastic silage caps with water-rolls are now available in the Northeast. Since they are said to be good for 12 to 15 years, they are certainly great money makers in terms of silage saved. The cost of labor which would have to be otherwise used in the disagreeable job of throwing out and taking away spoiled silage should not be overlooked.

### CHAFF

We have on hand the famous new Warfarin for control of rats but haven't had a chance to try it because the numerous cats, fed a mere trickle of milk, are so hungry that they go after and finish off the rats, all around the barns and the permanent and temporary corncribs.

\* \* \*

One cow giving the same amount of milk will eat twice as much salt as another one at next stanchion. Quite like humans. We respect the differing taste of cows by using crockery salt bowls encircled by an iron rod and clamped to the stanchions. The salt bowls alternate with drinking cups, so that a cow turns her head one way for water and the other for salt.

\* \* \*

When does a calf become a heifer and when does a heifer become a cow? The man who will supply simple answers good enough to be adopted generally, will become a benefactor to the dairy world. Try it. The best answers will be published here.

\* \* \*

Along the same line, the term "open" applied to a heifer or a cow can be highly misleading and expensive. Many of us have bought animals which would be "open" the rest of their lives. Wouldn't the term "unserved" be better all around?

\* \* \*

As my 61st birthday hove in sight, I was asked to name the food I'd like for a birthday dinner. I chose nothing less than that delectable blend of meat, bone and vegetables called OXTAIL STEW. While nourishing the man it satisfies the soul, even when the tail joints are from barren dairy heifers butchered on the farm. There is nothing better, unless it is leftover OXTAIL STEW, heated and served three days later.

The workers and worriers of Hayfields. Left to right: Marion, or Stub; George, or Junior; Kenneth, or Kenny; Charles, or Chuck; and the chief worrier, who is proud to say that these young men are taking an earnest interest in everything and not only do the work but share the worry of a delayed spring planting season.

**FREE RECIPES:** If you like coffee flavored desserts, you'll want General Foods new recipe leaflet, "19 Wonderful Coffee Recipes." To get it, write to American Agriculturist Home Department, Box 367, Ithaca, N. Y., and enclose 3 cent stamp for mailing.

The WESTERN CONDENSING COMPANY of Appleton, Wisconsin, is now marketing Peebles' 55, a condensed whey product designed for feeding hogs. It is also suitable for chickens or turkeys. It has 55% solids and is packed in 100-pound drums and 500-pound barrels.

The J. I. CASE COMPANY, Racine, Wisconsin, recently introduced a new Break-Away plow with a sure-acting break-away coupling which disengages the plow when it hits an obstruction. Without dismounting, the operator can back the tractor to the plow and recouple automatically. The plow is then lifted over the obstruction and the job continued.

The Sinclair Refining Company is showing a new movie called "Rain-maker" which depicts an amusing story of a community farm improvement program. It is available without charge for showing at farm meetings. Write to the SINCLAIR REFINING COMPANY, Sales Promotion Department, 630 Fifth Avenue, New York City.

Knox Out Multi-Purpose garden dust manufactured by PENNSALT CHEMICALS, 1000 Widener Building, Philadelphia 7, Pa., is now available for gardeners in a 12-ounce, easy-to-use blower dust gun. It will handle most garden insects and diseases. By dropping a postcard to the address above, you can get a 4-page folder which explains its uses.

THE AMERICAN SHORTHORN BREEDERS' ASSOCIATION, Chicago, Ill., announces that their newest booklet, "Manual of the Rules of Registry, Information" (for both Shorthorns and Polled Shorthorns), has come off the press and is ready for distribution.

Consolidated Products Company's milk replacement calf food, KAFF-A, is now available in 50-lb. cardboard cartons with a new design as pictured above. The product inside is sealed tight and fresh in a valuable polyethylene bag which is being used by housewives for many purposes. When opened fully, a sheet of polyethylene 32"x54" is available for making aprons, curtains, laundry bags, appliance covers, food wrappers and many other useful household items. Other farm uses include dairy equipment protectors, seed or vegetable storage, farm machinery tarpaulins, etc. To make things extra attractive for the housewife, the KAFF-A bags come in several colors, including red, yellow, green, blue and clear.

### REGISTRATION PAPERS

I bought a cow and calf from a cattle dealer. I paid a good price for them, with the understanding that they were registered. However, I have not been able to get the transfer papers. The dealer tells me I should get them from the original owner.

When a dealer or individual sells cattle on the basis that they are purebred, it is our feeling that he thereby intimates that papers are available and that he will see that the buyer gets them. In our opinion, a buyer is justified in holding back part of the purchase price of purebred stock until he does get the papers.

We realize that in some cases this failure to furnish papers is due to neglect or mistakes somewhere along the line. However, we have been getting altogether too many inquiries from subscribers who have had animals represented to them as purebreds, who have paid good prices for them, and then have had all kinds of trouble getting the papers.

— A. A. —

### PUT IT IN WRITING

I told my insurance agent that I did not wish to renew my policy with his company. However, he evidently failed to advise the insurance company. It was finally cancelled after about five months and they are trying to collect the premium for that time.

Evidently there is nothing in writing asking for cancellation of the policy. We do not question the word of our subscriber, but this is a sufficiently important matter to warrant making the request for cancellation in writing, being sure to keep a copy. Then if the policy is not cancelled as requested, they can't collect the additional premium.

A lot of trouble could be avoided if people would keep copies of all letters, orders, etc., and if they would make it a point never to send cash through the mail.

— A. A. —

### WRITE A LETTER

I sent some furs to a firm in New York City, making a note on the shipping tag to hold them to one side until I agreed to their price. The price didn't suit me and I asked that the furs be returned. The company told me they could not do that as the furs had gone right in with their stock.

On checking with this firm, we were advised that if a trapper wants a shipment held separately, he should write a letter and attach it to the outside of the package. This will only cost 3c more, and will definitely call attention to what he wants done with the shipment. It is too easy for instructions written on a small shipping tag to be overlooked. In addition, it is against postal regulations to write anything other than names and addresses on shipping tags attached to parcel post packages.

— A. A. —

### DIVIDENDS

I have some stock with a firm in Rochester. I used to get more stock as interest, but now I get a little money. However, they have cut the interest rate in half. Could this matter be investigated?

Stocks do not bring interest. Dividends are paid on stock in companies that make a profit, and the amount of these dividends depends on how much money is made and what part of it can be paid to stockholders in the form of dividends. Probably the firm this subscriber mentions is not making as much profit as it used to, and therefore the dividend payments are smaller.

**TAKES 4 GOOD QUARTERS TO MAKE A DOLLAR THESE DAYS**

Protect your cows... Keep them milking with these DR. NAYLOR products

FOR BRUISED TEATS, SCAB TEATS, INJURED TEATS, OBSTRUCTIONS

### Dr. Naylor's MEDICATED Teat Dilators

A profitable dairy cow must produce from all 4 quarters. Teat injuries lead to udder injuries. That's why thousands of successful dairymen would not be without DR. NAYLOR DILATORS — ready to use at the first sign of teat trouble.

**WORK 3 WAYS** . . . Dr. Naylor Dilators perform 3 distinct functions:

1. Carry antiseptics into teat canal to help combat infection and inflammation.
2. Furnish soft, absorbent protection to delicate lining of teat canal.
3. Keep the teat open and encourage a normal milk flow during the healing process.

**EASY TO USE.** Simply keep a Dr. Naylor Dilator in teat between milkings until teat milks free by hand. Dr. Naylor Dilators fit large or small teats.

## DON'T OVERLOAD YOUR MOTORS

A GASOLINE engine connected to a load that's too great will stall. An electric motor is different. It keeps trying to run and may burn out before it quits. Electricity flowing through a wire acts like water flowing through a pipe. If the pipe is too small, friction reduces the flow of water at the faucet. If the wire is too small, resistance reduces the electrical pressure, the motor starts slowly, the windings over-heat, and damage occurs. Ordinary fuses on the line will

not protect the motor against overloads—fuses only protect the wiring against short circuits.

To protect your motors you need special delayed action motor fuses or automatic switches. These cost much less than rewinding a burned-out motor.

Your electric company's Farm Service Representative can help you select the proper protection for your motors. Just call or drop a card to your electric company office.

NIAGARA MOHAWK POWER CORPORATION

NIAGARA MOHAWK

# Handle Hay The Easy Ferguson System Way

## The Ferguson Mower

Use no tools—except to tighten Cap Screw on drive shaft from power take-off. It's that simple.

And it's easy to use! You raise and lower the cutter bar by the Finger Tip Control of your Ferguson Tractor. You make square turns without stopping or circling. It's easy on you, too—rubber bushings absorb vibration—you don't get so tired from a long day in the field.

Quick attachment and easy operation are matched by quality of design and construction. Tapered roller bearings provide quiet running with minimum power. Bearings have adjustment for taking up wear. Year after year, you can keep your Ferguson Mower running smoothly, quietly, efficiently.

Available with six or seven-foot cutter bar. Ask for a demonstration of this fine Mower.

## The Ferguson Rake

The Ferguson Side-Delivery Rake is designed specifically for tractor operation. It greatly reduces leaf-shattering... safeguards the quality and value of your hay!

This rake is truly unique. New six-bar offset reel handles hay gently. No pitching, kicking and tossing even at high speeds. Instead, your hay is lifted gently, up and over into light fluffy windrows with the precious leaves turned inward.

True "sideward" raking action reduces the distance from swath to windrow by 50 per cent. There is far less rolling and churning... no sudden jarring. Tractor-mounted... power take-off driven... Finger Tip Control. Designed to operate in 4th gear. And it's surprisingly low in price.

**SIX-BAR OFFSET REEL  
MAKES A BIG DIFFERENCE**

## The Ferguson Tractor

When you add Ferguson's unusually high-quality standards to these features—and the many others you will see in an actual demonstration on your farm—we know you'll agree that although you can buy a cheaper tractor, you can't buy a better tractor at any price.

# AMERICAN AGRICULTURIST

FOUNDED 1842

THE FARM PAPER OF THE NORTHEAST

## Good Neighbors!

By  
**JIM HALL**

**O**N THE evening of Wednesday, May 2, Irving Russell of Moreland, New York, cranked his tractor while it was in gear. His leg snapped in two places when the tractor jumped forward, jammed him tight against a buzz saw frame, and then stalled.

Neighbor Ernest Crout answered Mrs. Russell's frantic phone call for help when she found that she couldn't crank the machine to get her husband out. For the next two days Irving, who had no hired help, suffered more from worrying about his unplanted oats and unplowed corn land than from the physical pain of the accident. He was face to face with a fear all farmers have—a fear of being incapacitated in the spring when a year's, or perhaps even a lifetime's, success depends on being able to carry on long days of hard physical work. He knew that without oats, seeding or corn in the ground, he'd be up against it trying to feed his cows next winter. He had cause to worry.

### Neighborhood Army

Just imagine how Irving felt Saturday morning, three days after his accident, when with a noise like a modern mechanized army, 23 neighbors drove onto his place with 8 tractors, two teams, two trucks, two power chain saws, and all the plows, harrows, grain drills and rollers needed to do his spring work! It's hard to describe his relief—and the gratitude he felt towards his good neighbors.

Shortly after noon, two fields of oats were in the ground and rolled down. One field was drilled on the contour and seeded to an alfalfa-brome hay-pasture mixture. The other field was seeded partly to the same mixture plus red clover, and partly to birdsfoot trefoil and timothy, following exactly the plan Irving Russell had laid down for himself for this spring. Another gang of neighbors, working in the woodlot, trucked the summer's wood supply to the wood shed, cut posts and repaired the pasture fences while the drilling and seeding were going on. They even plowed up some of the acreage planned for corn.

What was done for Irving Russell shows why farmers in Schuyler County, when asked to name their greatest asset, unhesitatingly reply, "Good neighbors!"

Among those farmers devoting all, or at least a part, of their day to extending a helping hand to an unfortunate neighbor, were Floyd Cleveland, Charles and Maurice Doane, Lawrence and Larry Personius, Vern and Ernest Crout, Bradley Wescott, Roy and William Ganung, Robert Marsh, Fred Ely, Elmer Baker, Merwin Gaylord, M. D. Wilcox, Law-

rence Johnson, Robert Teed, Warren Kent, Richard Welch, William Hurd, John and Roger Ganung, and Hubert Rhodes. Roy Ganung, without stock of his own, came over to Russell's for a month to milk

7 cows and care for 11 other head of stock.

Ernest Crout, who directed the work, said, "It's a great feeling to be able to cooperate and help out a neighbor who is in trouble." The Russells, who, incidentally, have now bought a tractor with a starter, feel that their neighbors "have done just too much," and say that their Moreland community "has the best neighbors and is the best farming community in which we could ever hope to live."

Irving Russell didn't know that in less than two weeks another Schuyler County neighbor, Bob Beattie, 20-odd miles away at Hector, on the other side of Seneca Lake, would be voicing almost the same sentiments.

Bob, who with his 74-year-old father, operates a 200-acre sheep and crop farm, including 30 acres of vineyards, was stricken with

↑ Tractors swarmed over Bob Beattie's vineyards when neighbors rallied 'round to get his spring work done while he was laid up with pneumonia. Above are, left, Carl Rhynhart, ringing vines with a grape hoc, and Budd Adams, plowing centers.

← When Irving Russell, left, smashed his leg in a tractor accident, 23 men, whom he called "the finest neighbors in the world," descended on his place to drill oats, plow, and fix fence.

While one group worked in Beattie's vineyards, another was busy with tractors, spreaders and loaders, getting 150 tons of sheep manure cleaned up and spread on the vineyards ahead of the hoes and plows.

virus pneumonia in mid-April. 150 tons of sheep manure was waiting to be spread and turned under in his vineyards, but the doctor wouldn't let him out of bed.

I was having lunch in a Watkins Glen diner when I heard that Bob's neighbors were going to surprise him the next day by moving in with their equipment to do his whole spring work in one day. I was there the next morning to be in on this neighborhood bee with my camera. I arrived after 19 neighbors came with as many tractors, and thought that I was in the middle of a machinery field day! Irving Davis, County (Continued on Page 11)

# Money-Saver

A growing pullet on good green pasture is saving money with every blade of grass she eats, every ray of sunshine she soaks up. She'll save even more if you feed her G.L.F. Green Pasture Growing Mash.

Green grass is cheap. Sunshine is free. Sunshine and grass provide a lot of the things growing pullets need—including many of the vitamins that cost real money when mixed into the mash.

That's the idea behind Green Pasture Grow-

ing Mash. It was developed especially for pullets on pasture, so the things the birds get from grass and sunshine are left out.

Saving—more than \$2.00 a ton.

Summing up—pullets on pasture eat less purchased feed, especially less mash. And they grow fully as well on a lower cost mash. These savings altogether add up to \$10.00 to \$15.00 per 100 pullets.

Cooperative G.L.F. Exchange, Inc.  
Ithaca, New York.

# How The Apple Business Looks to Me

By E. STUART HUBBARD

AN apple orchard in full bloom is a beautiful sight—but it's more than that to the apple grower who wants to know where he's going. First, it's a good time of the year—at the close of one season and the beginning of another—to appraise conditions in our apple industry. Second, a survey of this year's orchards in bloom throws considerable light on the reasons why we have had heavy crops of apples the past two years.

Of outstanding importance is the predominance of McIntosh, Cortland, Rome, Red and Golden Delicious in late apples, and Milton and Wealthy in the early. Where trees have been removed, the vacancies are largely of Baldwin, Greening, Ben Davis and others of the old, biennial varieties.

To be sure, some of the persisting varieties have a tendency to alternate bearing; green spots in the white sea of orchard bloom here and there emphasizes this. However, there is a surprising uniformity of full bloom, even in orchards where these varieties bore last season, provided the trees were spray-thinned and kept high in vigor by deep soil, pruning, fertilizing, mulching, manuring, spraying and hand thinning, where necessary.

Where old orchards appear to consist of older varieties, the proportion of non-blooming trees is very apparent. This is also true in orchards of the annual bearers where severe scab has injured foliage in past years or where severe wet weather or drought or overbearing has weakened the trees.

Many orchards or trees which grew in unfavorable soils or in frost pockets have been removed or abandoned. But the improved practices used in the younger, vigorous, well located orchards have resulted in such phenomenal yields every year that no lull in heavy production occurs unless widespread frost cuts the crop.

The close of the 1950 market season emphasizes the dominance of McIntosh and Cortland in public esteem.

**FIRST**, we recall how the movement in McIntosh dragged while the flood of Cortlands almost dominated our markets at lower prices. This demand for Cortlands continued as long as they remained firm and free from scald. In fact, we had Cortlands from a Northern orchard that sold readily into May at unchanged prices despite lower McIntosh prices.

**SECOND**, McIntosh continued in strong demand for as long as they were in edible condition. This compelling demand was demonstrated by the tremendous movement of McIntosh in May, with prices of the better quality and condition remaining fairly constant and then advancing toward the end. This

preference for McIntosh and Cortland has been clearly shown by the almost complete lack of demand for Baldwin, Greening, Rome, and even Spy, as long as the supply of the two popular varieties was ample to supply the demand. This popularity has extended out of our area into the near South and Middle West, where varieties which have formerly dominated these markets from nearby orchards have had to await the end of the Cortland and McIntosh seasons, or lower their price or improve their packs in order to secure their share of their markets.

**THIRD**, the quality and condition of the crop bore out forecasts that the three weeks' later picking season, the cool temperatures at which McIntosh were picked and stored in most sections, made possible the extension of the marketing season for both McIntosh and Cortland beyond the normal dates. In storages, however, where too many apples were stored in a short time to permit quick cooling, or where the gases of ripening were not removed early and often, early ripening occurred with loss of condition, loss of price and dissatisfaction to retailers and consumers. The use of controlled atmosphere apple storages has been a valuable factor in extending the McIntosh season.

**FOURTH**, the weather has been almost ideal for the steady transportation and sale of apples during the cold months, while it has been abnormally cool this spring. The berry crop is abnormally late in the South; the supply of southern vegetables has been below normal.

From a production and marketing viewpoint, all this is gratifying to the producers of McIntosh and Cortland apples—except that most producers are "going broke" at the prices that these apples have netted them.

Our unfortunate state is of grave concern to our southern and western neighbors. Our competition is ruining their prices and the demand for their apples.

It is obvious that the status quo of apple production cannot continue and support the producers unless use, demand, and prices can be increased. Such increases can only be secured by the greater part of the industry, distributors, cold storages, suppliers, and others, joining with the growers to make apples acceptable and available to consumers—and craved by them.

Unless a strong, determined, well organized effort to do just this is started at once in every apple locality, state by state, county by county, most wise growers must look for other vocations or, like old soldiers, quietly fade away.

When you attend fairs this summer, both county and state, don't miss the horse pulling contest. Anyone who faces facts realizes that tractors have replaced horses on thousands of farms, but no tractor can give you the thrill you get when you watch a perfectly matched team pull to the limit of their ability. That this is true is demonstrated by the crowds attracted by a modern horse pulling contest.

## FARM NEWS

from DU PONT

## "Parzate" Fungicide Gives Growers New Advantages from Better Disease Control

For growers of potatoes, tomatoes and many other vegetables, "Parzate" fungicide has proved to be an outstanding money-maker. Developed by Du Pont to fill the need for a mild but effective fungicide, it is tough on diseases but *not* on the crops.

**Controls Many Diseases:** "Parzate" provides exceptional control of early and late blight of potatoes and tomatoes, tomato anthracnose and leaf mold, downy mildew of cucurbits and lettuce, blue mold and white rust of spinach, purple blotch of onions, and many diseases of celery, beans, cabbage and other crops.

**Crops Grow Better:** Potatoes sprayed with "Parzate" in 1950 grew 6 inches taller than nearby plants sprayed with harsher fungicides. With other crops, too, "Parzate" allows the full vigor of normal growth that produces yield increases as high as 50 to 100 bushels per acre.

**Quality Goes Up:** "Parzate" helps you get larger, smoother potatoes, tomatoes free of blemishes, celery with sound hearts and stalks, melons that ripen sweet and flavorful through the season. The stronger plants that are free of disease give you more high-grade produce and fewer culls or seconds.

**Use "Parzate" liquid fungicide** for quick, easy mixing of sprays: It sticks to foliage exceptionally well. "Parzate" dry fungicide may be used either in dust mixtures or spray.

**DU PONT PARZATE®**  
FUNGICIDE

See your dealer for supplies of Du Pont "Parzate" and other pest-control products. Ask him also for free booklets that give detailed information, or write Du Pont, Grasselli Chemicals Dept., Wilmington, Del., or 350 Fifth Ave., New York 1, N.Y.

### DU PONT CHEMICALS FOR THE FARM

**INCLUDE:** Fungicides: PARZATE\* (Liquid and Dry), FERMATE\* ZERLATE\* Copper-A (Fixed Copper), SULFORON\* and SULFORON\*-X Wettable Sulfurs . . . Insecticides: DEENATE\* DDT, MARLATE\* Methoxychlor, LEXONE\* Benzene Hexachloride, KRENITE\* Dinitro Spray, EPN 300 Insecticide, Calcium Arsenate, Lead Arsenate . . . Weed and Brush Killers: AMMATE\* 2,4-D, TCA and 2,4,5-T . . . Also: Du Pont Cotton Dusts, Du Pont Spreader Sticker, PARMONE\* Fruit Drop Inhibitor, and many others. \*REG. U. S. PAT. OFF.

On all chemicals always follow directions for application. Where warning or caution statements on use of the product are given, read them carefully.

## HOW FOOLISH CAN WE GET?

**W**HAT'S the benefit of lower beef prices if you can't buy any beef? Students of economics tell us that a better price is the greatest incentive for more production. Yet, while we say we want more meat, we roll back the price of beef, thus discouraging meat production on every farm and ranch in the country.

The present price control law expires on June 30. Probably Congress will extend the law for a month or two, then revise the old law or write a new one. However, the drive for dropping controls entirely or at least limiting them is growing, with greatest pressure on forbidding future "rollbacks."

How did we manage to get into such a mess? A calm survey of the path down which we have come shows that politicians rather than statesmen led the procession. In spite of government figures proving conclusively that food costs were not high relative to union wages, consumers wailed. Consumers outnumber food producers by more than five to one, so something has to be done and done fast.

Furthermore, it is common knowledge that some Republican Congressmen voted for price controls last summer hoping thereby to embarrass the Democratic Administration. Now, regardless of the evidence, those same Congressmen dare not vote to discontinue controls, fearing blame for any price rise, no matter what its real cause. It's a sorry picture!

What can we do? For one thing we can grasp every opportunity to give the real facts to our friends in towns and cities. Fortunately most Senators and Congressmen are conscientious and hard working. They want the opinions of the folks back home. Here is your chance to give them yours. Address your Congressman at the House Office Building and Senators at the Senate Office Building, Washington, D. C. If you don't know their names ask your school principal.

All the best and soundest arguments favor dropping price controls. Most of us agree that government economy is the number one essential in fighting inflation. But instead of trimming federal expenses we increase them by adding more thousands of government employees to attempt the impossible job of controlling prices.

Common sense indicates that one of today's vital needs is a great moral re-birth of honesty and integrity in this country and in the world. What do we do? We pass a law and write a set of complicated regulations contrary to human nature and economic law, and which make patriotic law-abiding citizens into law-evaders and law-breakers, often unwittingly.

Those who want more and more controls say they have failed so far for lack of enough men and money to enforce the regulations. If the law is evaded or broken, they propose stricter laws and bigger penalties. So follow that line of thought to its logical conclusion and we will lose the very freedom we are fighting to preserve. Time is running out, but it's not yet too late to turn back and get on the right road. Start now by letting your Congressman and Senators know how you feel.

## AN OLD FRIEND

**I** WONDER if most of you don't have the same feeling about spring that I do. After looking forward to it all through the weary winter months, spring comes and goes so fast that I wish I could hang on to it and keep it forever.

From my bedroom window I watched the trees in our apple orchard begin to show signs of life. Quickly they were covered with that delicate first green of the leaves and finally came the glorious fragrant blossoms. Then it seemed only a day or two until the blossoms were gone, and now summer is at hand.

But then summer is all right, too. Many times on this page I have printed parts of James Whitcomb Riley's "An Old Friend," because it expresses

*By E. R. Eastman*

so well what all of us who love this Northland of ours feel about this season of the year:

Hey, Old Midsummer! Are you here again,  
With all your harvest-store of olden joys —  
Vast overhanging meadow-lands of rain,  
And drowsy dawns, and noons when golden grain  
Nods in the sun, and lazy truant boys  
Drift ever listlessly adown the day,  
Too full of joy to rest, and dreams to play.

The same old Summer, with the same old smile  
Beaming upon us in the same old way  
We knew in childhood! Though a weary while  
Since that far time, yet memories reconcile  
The heart with odorous breaths of clover hay;  
And again I hear the doves, and the sun streams  
through  
The old barn door just as it used to do.

## CORRECTION: PLEASE NOTE!

**I**N our last issue it was announced that the 320 central school districts in New York State who had not held their annual school meetings on the first Tuesday in May would hold them on July 3, the first Tuesday in July.

That was a mistake. The correct date on which these 320 school districts will hold their annual meetings is Tuesday, July 10, the second Tuesday in July. At these meetings the school boards and officers will report on the business of the past year and plans for the coming year. Budgets and other important policies will be put before the voters for their approval or disapproval. There should be plenty of time for discussion, but such discussion should be constructive and concerned entirely with the best interests of the boys and girls.

If you are interested in your schools, the most important business in your community, in young people, and in good government at the grass roots, mark this date, July 10, on your calendar and plan to attend the meeting.

## JUNE IS DAIRY MONTH

**T**HE "Milk for Health" organization, the dairy councils, dieticians and health people are all working together to urge consumers to use more milk and other dairy products, the best foods there are and, up to now, the most poorly advertised.

If you are a dairyman, the best way to help your own business is to support these campaigns, and, incidentally, see that the members of your family build their own health with all the milk they can drink and all the butter and cheese they can eat. Not only during June but in every month in the year.

## GET YOUR SHARE

**A**LMOST before you know it, it will be Fair time again. Premiums at the local and State fairs total thousands of dollars. Why shouldn't you get some of this money? The chances are that you are growing something in the way of livestock, vegetables, flowers, fruits or crops that can take some of this premium money if you plan for it and go after it.

## WHAT IS YOUR FAVORITE SHRUB?

**N**EVER before have I noticed so many beautiful shrubs in blossom as I have this spring. A flowering shrub is about the easiest way to decorate one's place and to have lots of flowers. Most of them require very little care.

One suggestion is to plant them on the edges of your lawn and close to the house, but remember that many shrubs grow large and if planted in the

wrong place may shut off your view later.

When you are driving around and see a pretty shrub in blossom, why not stop and find out its name, so that you know what to order from the nursery. If you already have some shrubs that are particularly beautiful, and especially if they are unusual, send me the names and describe them briefly, and I shall pass the information on to our readers. Personally, I recommend a bush called *Kolkwitzia Amabilis* or, in U. S. language, "Beauty Bush." It is a large shrub covered with beautiful, fragrant pink and white blossoms, which last almost during the entire month of June.

## HAYING METHODS HAVE SURELY CHANGED!

**W**HEN I was a boy on the home farm, we never started haying until after the Fourth of July. It seems strange, therefore, to ride through the country in the middle of June and find that so many farmers have haying well started, some of them with the first cutting all done.

The reason, of course, is that farmers are growing more legumes than they used to, which mature and can be cut early, particularly when used for grass silage. In many ways, the practice of putting up grass silage is one of the most important and profitable farm practices ever started in the Northeast dairy country.

Not the least of the advantages of grass silage is the way it has taken much of the backache out of haying. When you think of the old-time haying job, which started with hand mowing at sunrise and often ended at dark, day after day all summer, and compare those conditions with the way many farmers are now handling grass by machinery without even touching it, it seems that we have come a long long way in farm practices within one man's lifetime.

Sometimes when life gets pretty complicated I long for the simplicity of the old days, but cold reason tells me that those "good old days" were not so simple after all. Work was hard and long and monotonous; men and women had their trials and tribulations—different from ours, perhaps, but none the less difficult—and they died young.

## WATCH YOUR STEP

**D**URING the 24 hours before I wrote this editorial, I had reports of a farmer who got caught between his tractor and a shed, breaking his leg in two places; of another farmer who fell off a silo and was killed; and of a friend who caught her finger in an electric mixer, making it necessary to have the end of her finger amputated.

The more accustomed we get to these modern gadgets, the more careless we become. They are good servants—but vicious masters if they are not kept under control and treated with respect.

## EASTMAN'S CHESTNUT

**M**Y friend, Henry W. Gredel of Ithaca, told me about a fellow whom we will call Saunders, who played poker on Saturday nights and faithfully attended church on Sunday morning. A little sleepy one morning, by mistake he dropped a poker chip into the collection box.

Hastening to the vestry after the service, Saunders found the chief vestryman counting out the money.

"Mark," said the troubled contributor, "I guess I put some sort of a button into the box by mistake this morning. See if you can find it, please."

Mark poked around until he found the chip.

"Oh, thank you," said Saunders. "I'm glad to get it back. It's a sort of a keepsake to remind me of my evil gambling days. Here's a half dollar to take its place."

"Oh, no, you don't," said Mark. "That's a blue chip and it will cost you five dollars. I know what your game is!"

## STAND UP and BE COUNTED

Speak up. Let yourself be heard, whether you are for or against controls on livestock and meat. Individual letters to your Congressmen and Senators carry weight. Your representatives are sensitive to your thinking. Let yourself be heard. Stand up and be counted.

Following is a program developed with the assistance of the Doane Agricultural Service, one of the oldest and most reputable organizations of its kind in the country. This program has been adopted by many groups as the answer to controls and inflation.

The key to the whole program is to restore sound money. While farmers, ranchers, allied industries, agencies and consumers work at their jobs of producing more meat and encouraging thrifty buying and use of meat, Congress and the Federal Administration have the responsibility to exercise leadership to control inflation.

The methods of stopping inflation and the dwindling value of dollars are well known. Prompt and definite action is needed in Washington for:

1. Restriction on expansion of money supply.
2. Strict economy by government, thereby setting an example for business and individuals.
3. Pay-as-we-go taxation.
4. Limitations on consumer credit.
5. Encouragement of individual saving.
6. Increased production—remove controls that limit output and prevent full use of resources.

Fighting inflation with controls is too much like fighting a battle with broomsticks. If the control laws extend beyond June 30, they must be renewed by Congress. It will take an aroused public demanding action to get action in Washington.

Let your Senators and Representatives know what you want done. They want to do the will of the people. **STAND UP AND BE COUNTED.**

### Empire Livestock Marketing Cooperative

With Markets at Argyle, Bath, Caledonia, Gouverneur, Greene, Malone and Onondaga.

## AA's Farmers' Dollar Guide

**CONTROLS:** Federal price control law expires June 30. Chances favor extension for two or three months so new bill can be written and debated. Few changes likely. Farmers and businessmen can't muster strength to kill controls, but bureaucrats won't be able to stiffen them and price control powers are more likely to be limited than extended. Congress not keen about freezing farm prices below parity, or authorizing food subsidies. See page 13 for a discussion of beef price controls.

Washington continues to prod bewildered citizens about the terrible (and real) dangers of inflation; but steadfastly refuses to fight inflation along lines recommended by economists — for example, drastic government economy. Price control attempts, we hear, have already added 15,000 to government payroll. If you want economy, write and tell your Congressmen and Senators. If enough voters write, letters will get results!

**MILK:** The price of Class I-A milk in Metropolitan market for June is \$5.06 a cwt. Price of May milk was \$5.10; June a year ago, \$4.14. We commend Administrator Blanford for stating in the announcement that "dairy farmers are never paid the Class I-A price. Dairy farmers are paid a uniform price determined by the use made of all milk received at country plants and approved for the New York marketing area." Probably most city papers won't print that. Anyway, they have been given the facts.

Uniform milk price for May estimated at around 18 per cent above May last year. U. S. milk production is running slightly below last year.

**BEAN SUPPORTS:** Support prices for 1951 beans average \$6.69 per cwt. compared to \$6.30 last year. By varieties, support prices for U. S. No. 1 beans per cwt. are: Pea and medium white, \$7.84; red kidney, \$9.19; cranberries, \$8.54; baby limas, \$6.44; large, \$10.04. Premium for better than U. S. No. 1 is 10 cents and discount for No. 2 is 25 cents a cwt. U. S. stocks of beans on hand May 1 were 24 per cent below a year ago.

**SOUND PROGRAM:** Working together, farm organizations, livestock associations, meat industry groups and allied businesses, with the help of the Doane Agricultural Service, have issued a workable meat program which they call "More Meat and How to Get It with a Commonsense Meat Program." Chances are it is too sensible to be followed. The program is printed in 20 four-page pamphlets which you can get for 20 cents from Agricultural Center, 5144 Delmar Blvd., St. Louis 8, Mo.

**ECONOMY:** The House voted 142 to 120 against reducing the Agricultural Conservation program costs from 225 million to 150 million. In fact, the final appropriation okayed was 265.5 million.

**CO-OP TAXES:** The House Ways and Means Committee turned thumbs down on taxes on undistributed earnings of co-ops. However, the Committee approved a 20 per cent withholding tax on patronage dividends whether paid in cash, stock or certificates. A similar provision applies to mutual savings banks and building and loan associations. Probably it will become law and it will mean that taxes on patronage dividends will have been paid before you get them. —Hugh Cosline.

# STRAN-STEEL Quonset

## The All-Steel Farm Building for All America

More and more  
the American Farmer  
is relying on  
Quonsets for...

In the last ten years production methods on the farm have been tremendously speeded by the use of modern machinery. Many crops are now harvested in days instead of weeks. This stepped-up productivity has emphasized the need for farm service buildings that are more functional—buildings which are efficient *production tools*—which supplement machinery in increasing the production of both crops and animals.

With a Stran-Steel Quonset, the farmer has the finest non-combustible farm service building obtainable. It provides maximum comfort, convenience, efficiency, durability and adaptability. Its clean functional lines make it a source of pride and satisfaction. Its low maintenance cost and dependability mark it as a sound investment that will keep on producing year after year.

The shaded portion of the graph shows the relative amounts of lime being applied each month. The red arrow shows when little lime is being applied but when more could well be spread.

## Spread More LIME this Summer

**H**AVE you had trouble getting lime spread when you want it? If so, look at the figure above and you will probably see why. Most of your neighbors want their lime at the same time.

During the spring months the operators of bulk lime spreaders can't possibly keep up with the demands of farmers. But by mid-June the trucks may as well be put in storage. Hardly anybody wants lime in mid-summer. Everyone is busy cutting hay and cultivating corn. Years ago when farmers spread their own lime they got into the habit of taking it in the spring.

Now with bulk spreaders available there are many advantages to summer spreading. Farmers can get it when they want it. The ground is drier and heavy trucks don't cut up the field so much. Farmers can lime ahead for the whole rotation rather than rushing to lime each field before seeding.

Two places to put lime this summer are:

(1) Hay meadows after the first cutting. This applies especially to meadows that will be plowed for corn. Liming the sod is best adapted to fields that are only slightly to moderately acid. On a strongly acid soil it is less costly to lime after plowing than to apply the extra ton or two that is needed when the lime is mixed through the furrow slice. Summer is a good time to lime perennial legumes like alfalfa, ladino, or birdsfoot trefoil that will be left down for several more years.

(2) Pastures, either seeded or permanent. Some farmers have asked whether it is safe to lime pastures where cows are grazing. The answer is Yes, ground limestone is harmless.

Liming new seedings after the grain is harvested is suggested only as an emergency measure where a farmer was unable to lime before seeding. It is effective only if there is enough lime in the soil to get the legumes started and hold them until the grain is cut. —Samuel R. Aldrich, Department of Agronomy, Cornell

### DUMPED POTATOES MAKE GOOD (BUT EXPENSIVE) FERTILIZER

**T**HE ABOVE photo shows the effect of potatoes dumped last fall under the government purchase program on winter barley this spring. The picture was taken May 2, 1951, in Mercer County, New Jersey. Before dumping, the potatoes had to be dug and sacked in rows. After being checked by the inspector, the bags were dumped.

Fresh potatoes are approximately equal in nitrogen and potash content to stable manure, but contain less phosphoric acid. The effect noted on the winter barley is obviously due chiefly to nitrogen. Assuming the field yielded 300 bushels to the acre, the fertilizing value was approximately equal to 9 tons of stable manure applied to narrow rows rather than broadcast.—George H. Serviss.

## New York F. F. A. Delegates "Take Over" Malone

**O**VER six hundred Future Farmers, teachers of vocational agriculture and friends, including delegates from around 300 high school Future Farmer Chapters, met at Malone for three days, May 24 to 26, for their 26th annual convention. The high spot of the convention was the banquet Saturday evening. The only speech on the program was made by Richard Waybright, a Pennsylvania Future Farmer who is fourth vice president of the National Association.

Left, James Heiman of Akron, winner of the New York State FFA speaking contest.

tion. He told of a trip made by the National officers to several cities and several industrial plants allied with agriculture. Observations resulting from the trip were the immense amount of money spent in research and the unlimited care and testing which went into equipment before it was ever put on the market.

Throughout the year Future Farmers competed in many contests. Winners were announced at the banquet as follows:

James Heiman of Akron as public speaking contest winner took home \$100.

Philip Cowie of Perry and Phillipo Casamento of Norwich were American Agriculturist Achievement Award winners. The American Agriculturist Achievement Award is given each year for leadership in youth organizations. In addition to Future Farmers it is awarded to a boy and a girl in each of the following: 4-H Clubs, Granges, and Young Cooperators. It is also given to a Future Farmer and a Future Homemaker in New Jersey and to two young Grangers in that State. Many of the boys at the convention had previously won the American Agriculturist Foundation Award as the best vo-ag boy in their respective schools.

The State Star Farmer Award of \$100, given by the National FFA Foundation, went to David Scofield of Hillsdale. The National Foundation is financed by interested industrial and business concerns. In the following list, the prize money came from the Foundation except where otherwise specified:

Kermit Marquis of Dryden won \$100 for developing the best dairy enterprise.

Four boys, Scofield and Marquis (mentioned above), Sheldon Randall of Malone and Donald Ketchum of Whitney Point, won \$25 each, offered by the

New York State Holstein Association for developing excellent dairy projects.

Ralph Francisco of Rushville won the Farm Mechanics Award of \$100, the NEPPCO Award for the Best Poultry Boy, and a trip to the NEPPCO Exposition at Harrisburg next fall.

Carl Balback of Pine Bush won the Soil and Water Management award of \$100.

Charles Bottum of Addison won the Farm Electrification Award of \$100.

The New York Central Railroad presented \$50 to two boys to attend the National FFA Convention next fall. Winners were Donald Thompson of E. Bloomfield and Carl Pearce of Union Springs.

Thompson and Pearce (mentioned above), Robert Sanders of Union Springs, Everitt Tenant of Cincinnati,

Phillipo Casamento of Norwich, left, and Philip Cowie of Perry, were American Agriculturist Achievement Award winners.

Leon Button of Rushville, Charles Bower of Genoa and Ronald Shaut of Avoca, each won \$25 from the FFA Foundation for the excellence of their projects.

Harold Jones of Cazenovia won a two-year scholarship to a two-weeks' School for Bankers at the New York State College of Agriculture, given by the New York Bankers' Association.

The Canton Chapter of FFA won the \$50 award offered by the State Seed Association for their work with improved seed. The Scio Chapter was second and won \$25. Two individual winners were David Gibson and Robert Furman, both of Canton.

The South Kortright Chapter won an award of \$25 offered by the State Poultry Improvement Cooperative. The Scio FFA won a similar prize of \$25, and Larry Cairns of South Kortright won 300 chicks as top individual.

Williamson FFA won \$100 for work with canning crops as offered by the Association of New York State Canners. Ronald Van Acker of that school won \$50 as an individual. Perry FFA took second prize of \$50, and Oliver Brown of that school won \$30. Brocton was third, winning a \$40 prize. Albion was fourth, winning \$35.

# Rain when you want it

PHOTOGRAPHED AT THE FARM OF PETER A. FARRAR & SON, HAMMOND, N. Y., MAY 25, 1951

## Farmers are looking, thinking, talking about what may be the next revolution in Northeast Agriculture

**O**N millions of acres in the Northeast, the limiting factor in crop production is water. Most years there is enough total rainfall. That still leaves the dry years. And even in average years the rain often doesn't come at the right time.

Portable aluminum irrigation equipment is the most promising rain-maker yet developed. It makes irrigation possible on any farm that has a good source of water.

Irrigation in arid lands has been practiced for centuries. Its use in humid climates is relatively new. But already it is being used in nearly every county in G.L.F. territory. Right here in the Northeast, irrigation has saved vegetable crops that would otherwise be lost. It has turned some operations from loss to profit. It has raised the carrying capacity of pasture from one to three or even six cows to the acre.

These are some of the reasons why crop and dairy farmers all over G.L.F. territory are giving deep thought to this question of irrigation.

G.L.F. has been following developments closely ever since the first portable equipment appeared on the scene. Working with farmers and with manufacturers, G.L.F. engineers have been instrumental in developing simple, practical equipment. It is light in weight, yet sturdy, and easy to put together and take apart.

If you are thinking about the possibilities of irrigation, talk to your local G.L.F. manager or agent. He can arrange to have a trained man come out and discuss it with you. Cooperative G.L.F. Exchange, Inc., Ithaca, N. Y.

### Question Box

When insulating a henhouse, where should the tar paper be put: next to the outside surface or on the inside of the insulation?

The purpose of the tar paper or other vapor barrier is to prevent the moisture from working into the insulation and destroying its effectiveness. In homes, poultry and hog house, stables and other livestock shelters, the inside air is warm and contains excess moisture which tends to condense as soon as it strikes the cooler air in the insulation. Hence, in all such cases the vapor barrier should be between the insulation and the inside air. Usually it is put on the inside of the studding and then protected from mechanical damage by matched sheathing of some type. There is no danger from outside moisture if the outside siding is rain and snow proof.—I.W.D.

What is a good yield of canning factory peas?

A ton of shelled peas per acre is an excellent yield. Yields vary a lot depending on date of planting, weeds, rainfall, etc. In general, late varieties yield heavier than early varieties.

I would appreciate information on how to measure hay in the mow.

The method is as follows:

First, determine the number of cubic feet of hay that is in the mow and then divide by one of the following to determine the number of tons:

For alfalfa hay that has been in the mow over 90 days, divide by 470.

For timothy and for timothy and clover mixed, divide by 625.

This, of course, is not exact, but it is as close as one can come without actual weighing.—G. H. Serviss

We had quite a loss in our backyard peaches. They seemed to rot about the time they were ripe. Can we stop this next year?

This sounds like brown rot, which was unusually bad in some areas last fall. Dusting with sulphur will control it.

Trap nests mounted on the door of each pen save time on the Francis Townsend poultry farm at Cazenovia, New York. (Joseph Foley shown in the picture) The door on each end of 16 pens opens into an alleyway running the entire length of the henhouse. The person gathering eggs and making the trap-nest record may do so without entering any of the pens, thus saving time

### BABCOCK'S HEALTHY CHICKS

MAKE GREAT LAYERS

At the 1950 Storrs Conn. Egg Laying Test our White Leghorns won first all breeds, with 3899 eggs and 4124 5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the all-time World's record for all breeds, all tests won in 1944-45.

WE HATCH THE YEAR ROUND White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks. We own two hatcheries with 600,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

## Good Neighbors!

(Continued from Page 1)

Agent, was running a power loader, and others were kept busy with hand forks loading the 7 manure spreaders that were on the scene.

The manure had hardly settled on the ground before other neighbors with their grape hoe-equipped tractors were ringing the vines. A third group followed, plowing the center strips.

Jim Hazlitt, nearby fruit grower, had been elected chairman of the vineyard committee and, besides running his own three-bottom Rutherford vineyard plow, "bossed" the entire operation in order that a maximum of work would be accomplished in a day.

It happened that I knew quite a number of the neighbors who turned out for this bee but I got only one answer when I tried to tell any of them how fine and generous I thought they were for such a wonderful neighborly gesture. The stock answer was: "I have never known a time when Bob Beattie wouldn't give up doing his own work to help a neighbor. This is the first chance we've ever had to get even with him."

Despite the doctor's orders, when the first tractor and spreader came in the driveway at 7:00 a.m., Bob felt that he should get up to see what was going on. When a second, third and fourth rig clanked into the driveway a few minutes later, he couldn't have been held in bed with a team of horses. Forbidden the outdoors or any exercise, he got as near to the work as he could—at a table by the kitchen window—and when I dropped in for a minute, he had a tally sheet listing every man who had driven in that morning.

Those who were working when I left were Leon C. Mapes, Carl and Auriol Sutphen, the Harry Robinsons, both Junior and Senior, Budd Adams, James Hazlitt, Elmer and Manley Mathews, County Agent Irving Davis, Walter Kendall, Homer Davis, Linfred Freese, Julian Kent, Coral Welch, Harry Simpson from the Walter Johnson farm, Carl Rhynchart from the Ben Birge farm, and Lester Mitchell from Don Wickham's farm. Also busy, of course, was Bob's 74-year-old dad.

Others who joined in the work during the day were Jim Bond, Dan Murphy, Don Huston, Frank Frederick, Al Fletcher, H. Burrell, Everet Kaufman and Harold Palmer.

What happened on the Russell and Beattie farms couldn't be bought. These neighbors were not for hire — they were in the midst of their own spring work, trying to get as much as possible done on their own farms during each daylight hour. Money would not have taken them away from their own fields, but they wouldn't stay home when they learned that a neighbor's whole year's work was in jeopardy. The proof is that on both places more men and equipment showed up than had been contracted by those who first got the idea of helping. As one long, lean farmer told me at the Beattie place, "Huh! It makes a fellow feel good to be able to help a neighbor. We're gettin' more out of this than Bob is."

Of course such good neighborliness isn't limited to Schuyler County — there was a similar bee on the Earl E. McWithey farm near Liverpool in Onondaga County when he got sick at planting time; and another in Tioga County earlier in the spring—but I couldn't wait to write this out before telling Ed Eastman all about what I found in Schuyler County, and pointing out that the "old-fashioned" spirit of helpfulness was still alive on our farms. Ed listened to my enthusiastic recital, and said, "Of course it's still alive. Men who work with God, the earth and the weather will always have it." He handed me a few words scribbled on paper and added, "Here, Jim. Perhaps you'll want to use this in your story":

"A man there was, and they called him mad; The more he gave, the more he had."—*Bunyan*

### THE Innes BEAN WINDROWER

**SAVES TIME  
SAVES LABOR  
SAVES COMBINE  
SAVES BEANS**

Model 50 C base unit.  
Makes a 2-row  
windrow

**WINDROW AS YOU PULL.** Do the whole job in one operation with this one piece of equipment.

**RENEW NOW**  
**WHILE THE PRICE**  
**IS STILL LOW**

## DOWN THE

By J. F. "Doc" ROBERTS

**B**Y FAR the most serious condition facing agriculture, and all of us, is whether our food is to return to the price determined by ourselves or to a price made by bureaucrats. Since Mike DiSalle, the all-powerful government control appointee, says all controls depend upon the livestock control now in force, and since this is a livestock column, let us see what is actually going on, rather than talk about what might happen.

Since the price freeze order and roll-back of February 15th in beef prices, cattle, in actual market sales, has advanced in price. How could this happen and why, we will let Mr. DiSalle explain, since he has repeatedly said it could not and would not happen.

On May 20th an actual live price ceiling was placed on cattle for meat. Since then the lower priced cattle have disappeared from the markets (this is especially true of the eastern markets), and prices have consistently been climbing.

### How Is It Done?

Here are the figures:

Government Placed  
Maximum Ceiling Price

Top steers .....	\$37.00
Bulls .....	27.00
Utility cows .....	22.05
Canner and cutter cows .....	19.30

Government Market Report  
Prices Being Paid

Top steers .....	\$40.25
Top Bulls .....	32.50 to \$33.00
Utility cows .....	24.25 to 28.00
Canner and cutter cows .....	18.00 to 24.50

First table indicates what the government says can be paid for live cattle; second table—what the government market reports say is being paid (buyers are either losing money or a black market is developing).

These figures are from Chicago re-

ports for week ending May 26.

Let us take bulls as a further example. Mike says all bulls must be graded into one lot and no bull carcass can be sold for over 47 cents a pound in the meat. Recently I saw a bull sell for \$33.90 per hundredweight alive, with many selling over \$33.00 and any old bull from \$30.00 up. The cost of that bull meat to any packer will run from 53-56 cents per pound.

### Another Problem

Again the impossible has happened. They have cut quotas on the cattle "kill" of all legal packers from 90 per cent to 80 per cent of what they were killing a year ago. Mike says the U.S.D.A. reports a 7 per cent increase in cattle numbers this year over last. Authorized packers cannot legally kill over 80 per cent as much as they killed a year ago. Then a fair question is: What is to become of the balance, or 27 per cent of all cattle? This is a perfect black market setup. Speaking of quotas, the control law says no new packers can get a "killing" quota who were not killing a year ago, and every quota is based on the "kill" of a year ago. Yet right here in the Buffalo area alone, I can name four slaughterers who were not killing cattle a year ago, but who now have quotas and are among the most aggressive cattle slaughterers paying present-day prices. How could this happen? I wish someone would explain.

This is the thing that was going to save the housewife \$700,000,000. Mike says over the radio that they now have 6,500 employees hired since February, and they plan to have 9,000 all together. At \$4,000 a year each (a very conservative figure); then add traveling expenses, office rents, printing (their orders now comprise over 300 pages of fine print), office expenses, telephones, stationery, etc., and where has the \$700,000,000 gone, even if it worked.

Russia, Italy, England, any country you name, have all proved that government-controlled prices only raise prices and bring on black markets, and we in America are proving it again.

## Field Day Will Celebrate 50 Years of Farm Electric Power

**I**N MARCH, 1898, Guy Roosevelt Beardslee, a gentleman farmer operating his father's estate at East Creek, N. Y., completed construction of a 60-cycle hydro electric generating station at the East Canada Creek falls. Located half way between Little Falls and St. Johnsville, N. Y., on the north side of the Mohawk Valley, this station supplied power to his own establishment and to the Village of St. Johnsville.

The next year, Ross Sadler, grist mill operator at Inghams Mills, 2½ miles up stream from Beardslee's, requested electric service. A line was built and put in service late in 1900, running along the Snells-Rush Road for 4½ miles through rich farming country. When Charles Cook, a farmer along the line, took service for power late that year it made his first farm served from a rural power line in New York State. The Cook farm, now owned by John Burkdorf, has had electric service continuously ever since. On the same stretch of road between Little Falls and St. Johnsville, a 10-horsepower, 60-cycle motor started working on the Clarence Timmerman Farm in 1903 and has been in service since that time.

Celebration of this 50th anniversary of the first rural power line in New York State, and of the great progress made in farm electrification during the last 50 years, will be held Saturday, June 30, on the Charles Timmerman Farm near the old Dutch Church on the

same Snells-Rush Road that carried the first electric power to New York farms.

The celebration is being planned by the New York Farm Electrification Council of the College of Agriculture, Cornell University. As the purpose of the Council is to carry on research and disseminate information to all farmers in making use of electrical power, the exhibits at the celebration will be non-commercial. These exhibits include a big tent full of equipment contrasting farm operations as they were carried on in 1900 compared with the operations now done under electric power.

Another large tent will contain exhibits planned by county agents and home demonstration agents from four counties. They will cover such subjects as farm shop, dairy barn management, labor saving poultry house, model kitchen, freezing, home laundry equipment, and proper home lighting.

Another exhibit will consist of the well-known "House of Magic" designed by the General Electric Company, to be shown at 10:30 and 11:30 a. m.

During the afternoon the uniformed male chorus of the Rochester Gas and Electric Company will present two programs, and the "Farm Paper of the Air" will be broadcast from the farm at 12:30. The speaking program will start at 2:00 o'clock and will feature three speakers representing agriculture, electric utilities, and the State of New York. A crowd of several thousand is expected.

## only **Jacuzzi** **AQUAMAT**

... gives you this  
complete, low cost  
**ONE UNIT JET  
WATER SYSTEM!**

The famous name of Jacuzzi now brings you this amazing, compact water system. The AQUAMAT provides 250 gallons per hour from depths up to 22 feet. Yet this compact "Modern Appliance" (pump and tank combined) is only 27 inches high and 16 inches through.

The new AQUAMAT jet type water system is noiseless, self-priming and easy to install. The AQUAMAT is built and guaranteed by JACUZZI, originators of jet pumps.

Jacuzzi also offers a fine line of shallow and deep well pumps including: Selective Stage deep well jets, Ever-Prime shallow well and Vertical or Horizontal Speed-Prime shallow or deep well water systems.

## WHAT'S GONE BEFORE

Immediately after his marriage to Ann Clinton, Mark Wilson leaves to join Lincoln's volunteers. His brother, Charlie, and his father, George Wilson, follow him into the Army; also Ann's father, Fred Clinton. When Mark becomes involved with the entry into the Union lines of a Southern spy, his mother and Ann journey to Washington, see the President, and obtain a pardon. The news comes through that Mark has been killed at the Battle of Fredericksburg and Ann's grief seems beyond her ability to bear. When George Wilson comes home a memorial service is held for Mark.

## CHAPTER XXI

After Hooker's disastrous defeat at Chancellorsville, Charlie Wilson was kept busy with the cavalry trying to find out what Lee was going to do next. They found out. Lee's whole army was on the move toward the North again. So on June 11 the bugles sounded "Pack Up!" and the Army of the Potomac started back toward the North after Lee, always keeping between him and the city of Washington.

Day after day during most of that hot month of June the Army plodded on and on—sweat, dust, dirt and curses; and the next day more of the same. Never in his life had Charlie been so tired as he was at the end of every long day. At nightfall he almost fell out of the saddle, took care of his horse, ate his rations, and fell instantly asleep in his blankets, only to be aroused next morning at daybreak by the bugles, climb in his saddle, and ride wearily on.

Complaining bitterly and swearing because of their thirst and the heat, the foot soldiers threw away about everything, and the road was lined with baggage which the men refused to carry farther. The infantry cursed about the cavalry, who could ride while they had to walk, but it seemed to Charlie that the complaints should be the other way around. For every mile that the infantry marched, the cavalry had to go two. Theirs was the scouting job to ride this way and that in order that Hooker might have information as to where Lee was going and what he was up to.

On the night of June 30, Charlie camped with the cavalry near the little Pennsylvania town of Emmitsburg, and was overjoyed to have a visit with his father. After exchanging greetings and whatever information each had from home, George laughed ruefully about the demoralized condition of his band after the long grueling march from Virginia to Pennsylvania in pursuit of Lee:

"Our big drum is gone," he said. "Both heads are busted. So is the snare drum, and you can't blow a note through half of our smaller instruments."

When he arose to go, George said:

"I don't know what you've heard, Charlie, but I'm violating no confidence when I tell you that something big is afoot. They say that Lee has turned on us and that we'll soon be in a fight which may be the most important one of the whole war. If he defeats us this time, he'll be free to continue his invasion of the North, to capture Harrisburg and Philadelphia, and maybe bring the war to a successful end for the Confederates."

On that portentous note father and son shook hands, George to return to his band and Charlie to sleep, if he could.

Next morning Charlie woke soaked to the skin. It had poured all night, and now was coming down harder than ever. Fires built to boil their coffee smoked and sputtered in the rain and mostly refused to do anything but smolder.

Tired, sullen, and depressed, the men finally found themselves in the saddle and on the move again. With heads down and shoulders hunched against the driving rain, opening their mouths only to growl at one another, the long columns of men on horseback moved slowly North again. Suddenly every cavalryman straightened up as one man. Without orders, they pulled their horses to a stop to listen, every sense alert.

Yes, there was no mistake. They had heard right. From the North came a distant, steady, ominous rumbling. No, it wasn't thunder; these veterans had heard it too many times to be mistaken; it was cannon. Charlie shivered and thought of his father's words: "Something big is afoot."

Still without spoken orders but as if by common consent, the troop pushed on at a faster trot toward that fearful rumble constantly growing louder. Sergeant Miller, moving up the column a little faster than the rest, pulled his horse alongside Charlie's. Drawing his arm across his face to clear it of water, he grunted out of the side of his mouth:

"Guess this is it, Wilson. General

Reynolds up there got his cavalry too close to Lee's tail for the old fox's comfort, so he's had to change his mind about goin' on to Harrisburg and is tryin' to drive Reynolds back. Leastwise, that's the word that's comin' down the line."

"Where we at?" asked Charlie.

"A little town called Gettysville or Gettysburg, or somethin' like that. Never heard of it before."

The sergeant pulled a plug of greasy, wet tobacco out of a hip pocket, put it between his teeth and worried it back and forth until he had pried loose a good-sized chunk. After getting the cud stowed in one side of his mouth, he grumbled around it:

"Tain't so good for our boys, neither, 'cording to what I hear, Reynolds has been killed, an' our men are bein' chased back through the village."

It still rained. Every time Charlie moved, more water ran down his back. Forced off the road by the fleeing refugees and their vehicles, the cavalrymen rode through the roadside ditches and adjoining fields. The whole countryside was soon trampled by the Army into a vast sea of mud, the horses' hooves often making a loud plop as they pulled their feet up out of the engulging mess.

At dusk on July 1, Charlie's regiment came within sight of the village of Gettysburg. The fighting was over for the day. All knew that it had been a bad one for the Federals. The Confederate troops had driven them through the village to a long slope or low ridge to the south and east of the village known as Cemetery Ridge. Across the wide valley on a smaller, partly-wooded ridge were the Southerners.

As Charlie's regiment rode forward, they could see on their left, not a hundred yards distant, a hundred twinkling campfires of the Southerners, over which they were cooking and eating their suppers and paying not the slightest attention to the Union troops riding within easy range of their guns. Turning off from the Emmitsburg Road, the troops rode in back of Cemetery Ridge, dismounted, picketed the horses, and rubbed them down, fed them the meagre supply of grain, and

then, with great effort, built their own fires to make a pan of hot coffee to wash down their hardtaek.

A little later, standing on the rocky escarpment known as Round Top that rises above Cemetery Ridge, Charlie looked across the wide valley to the campfires of the enemy still twinkling on the other side, and then back toward Gettysburg at the long line of Union campfires, now dying down to beds of coals, and around which lay thousands of Federal troops waiting for the morrow. It was quiet. On that July night, even the Confederates knew that while they had been successful in the first day's fighting, it was only the beginning, and only God knew what the final answer would be.

Someone laid a hand on Charlie's shoulder. Startled, he swung around with an exclamation.

"Take it easy, boy. Don't be so jumpy," said his friend, Sergeant Miller. "I jest came up here to look, too. Prob'ly we're thinkin' 'bout the same thing. Notice them Johnnies at their supper as we came in?"

"Yes, I did," said Charlie.

"Know what I thought?"

Charlie didn't answer, knowing that none was expected. The sergeant went on:

"I sort of wondered what it's all about. Them boys over there are jest like us. They've got mothers an' sisters an' sweethearts back home, prob'ly."

"Yeah!" he continued. "They eat an' they drink an' they sleep, some of 'em are stinkars, jest like some of our boys are, but by an' large they're just the same as us. So how did we ever get into this hellish mess where we're shootin' at each other? I don't hate 'em—do you?"

Charlie shook his head.

"Look down there now. Remember that peach orchard we saw when we were coming in? There was a piece of wheat, too, just ready to be cut before we marched through it. There was pastures with cattle grazin'. I even saw where a farmer had got some hay coked up in the field 'fore he left in a hurry."

Miller stopped, running out of words. "Why the hell don't you say somethin'?" he growled.

"What is there to say?" Charlie replied, quietly. "I agree with you. I don't know what it's all about. That's not quite right, though. I do know, but now that we're in this mess we've got to fight our way out. What bothers me is why the big boys got us into war in the first place. Why couldn't they have settled things some way without our having to kill each other?"

"Yeah!" said Miller, "that's what I was tryin' to say."

He stopped to spit, and in the half light Charlie could see his jaw going vigorously on his cud.

"I'll tell you one thing, bub. You think you've seen some fightin'. From what I hear, an' from the way these armies are lined up, it looks like we're all here, the whole kit and caboodle! Over there's the whole Army of Virginia, an' over here's the whole Army of the Potomac. Tomorrow's goin' to be quite a day! An' for some of us there ain't goin' to be any more to-morrows!"

Charlie could hear him mumbling to himself as he left abruptly and went off down the slope to find his blankets and a place to sleep.

\* \* \*

The sun always pops up early over the horizon on a July day in Gettysburg, and July 2, 1863, was no exception. But the 85,000 men under General George G. Meade, who had succeeded Joe Hooker as Commander of the Army of the Potomac, and Robert E. Lee's 80,000 Confederates, were up even before the sun. From the start of that second day's battle at Gettysburg,

(Continued on Opposite Page)

## A Different Kind of Bull

W. L. Nelson - CONT.

# NO DRUMS

(Continued from Opposite Page)

it seemed that every man on both sides fought as if he somehow knew that on the result of this one battle depended the success of the whole bloody war. It was a part of Lee's strategy, while keeping his front lines busy, to get his cavalry around the flanks of the Union Army and come at the Federals from the back as well as the front, thus catching them in a gigantic trap. But it didn't work out that way, for one reason because the Union cavalry, including Charlie Wilson's regiment, were able to check the Confederate horsemen and drive them back.

Knowing that the bandsmen were working with the field hospitals, Charlie sought for his father after the battle, and came after a while to Rock Creek, where some of the field hospitals had been set up near a supply of water. Here they had brought all of the wounded from this section of the battle where much of the fighting had occurred during the day. Like the stacks of wood that Charlie had helped to split and pile back home, the dead were corded in piles. They had been dead when the ambulances brought them to the tents where the surgeons worked, or had died there under the surgeons' knives. All through the meadow that bordered this little creek, other dead lay where they had fallen, so thick that it was hard to walk without stepping on them.

In the tents the surgeons had put up tables, and, with shirts off and bare arms covered with blood to the shoulders, they were still hard at work, throwing amputated arms and legs into constantly growing piles just out-

side the tent doors. Paralyzed with horror, Charlie stood watching one of the doctors suddenly throw up his arms and sit down.

"In God's name!" he muttered, "what can doctors do when men kill and maim themselves like this!" Exhausted, he sat with slack mouth open, hands dangling at his side, fingers dripping blood.

Another doctor spoke gently to a boy on the operating table who was yelling with pain.

"Breathe deep, son. This will help."

It was chloroform, and as the boy grew quiet, the surgeon muttered:

"Thank God for this, anyway."

Already the awful stench of flesh decaying in the hot weather was sickening and overpowering, like a rotting dead horse or cow at home, only worse, much worse, Charlie thought. He kept moving. At last he found his father. He, too, was shirtless and covered with blood. By the smoky lanterns Charlie saw how pale and tired he looked. He was busy moving the wounded to and from the surgeons' tables, and had little time to talk.

"Thank God you're safe, son," he said. "Maybe the worst is over."

"Not yet," said Charlie. "Neither side's won. The boys all say this is to be a fight to a finish. Tomorrow will be another day."

"Yes," said George, wiping the sweat from his forehead and leaving bloody streaks, "tomorrow will be another day, but the officers say that the issue was really decided today."

He turned to help another worker carry a moaning boy into the tent, and Charlie started back to his own company to get what sleep he could.

Again the hot July sun climbed over the eastern horizon to find the great armies already astir. All that morning Charlie watched the galloping horses of the cannoneers, urged to ever greater speed by the kicking, yelling riders on each team, haul the rolling, rumbling, rocking cannon, each with its attached caisson and clinging men, dashing to get into position on Cemetery Ridge. When approximately located, the horses were unhitched and rushed away to haul up another big gun, while the cannoneers cut the caisson loose and placed the gun in exact position. Across the death valley, the Confederates lined up 150 cannon on Seminary Ridge, as against the Federals' eighty heavy guns (all that Meade could find room for). These were located a little back of the front lines, ranging from Cemetery Hill to Little Round Top.

Anticipating what was to come, the Union infantry worked frantically to build stone walls and entrenchments. Suddenly it seemed to Charlie that all the noise in all the world was centered in that one spot as the batteries of both armies opened fire. The very ground shivered and shook as in an earthquake. Looking around, he noticed that the men stood with their mouths open. He opened his and knew why. It helped to ease the strain on his eardrums.

Added to the din and roar of the cannon was the noise of the bursting shells and the screams of the wounded when occasionally a shell from a Confederate gun landed squarely on a Union battery, throwing metal and human debris into the air. Sergeant Miller, who stood beside Charlie, said something to him, but the only way that Charlie knew that he was talking was because he could see his mouth going. Then Miller moved closer and leaned over to shout in the boy's ear:

"This is only the beginning," he yelled. "The hellions hope to paralyze us. But we'll show 'em. When this stops, watch out!"

It did stop, but not until after two hours of the mightiest artillery duel in history. Suddenly the firing stopped. The men said little, and when they did speak it was almost in a whisper. It

was so quiet that Charlie found himself walking on tiptoe. "It's like waiting for the end of the world, for Doomsday," he thought, and he knew that for thousands of them it *was* Doomsday. Then down the long Union line, men began to stir, rolling out of the depressions and standing up back of the breastworks. They scanned the other ridge and, sure enough, there was soon something to see. Across the valley in the woods and brush on Seminary Ridge there was movement. Out from the brush came a long line, so far away that the men looked like pygmies. Down the gentle slope it moved briskly. Back of the first line was another, and back of that still another, the lines merging into one oncoming mass—eighteen thousand veterans of Lee's best, under General George E. Pickett, the flower of the Confederacy. Miller spoke in an undertone:

"This is it, Charlie! This is it!"

Charlie shivered. Paralyzed with fear, he wanted to run backwards, get on his horse, and ride away from there. Instead, he stood watching that army in gray coming toward them. It seemed as inevitable as time itself. Nothing could stop them, nothing. This was indeed the end—Doomsday.

Then the tumult and noise broke loose again with the boom of Union artillery. It took but a moment for the gunners to shorten the range and guide it on those, advancing lines, and soon the shells began to fall among the men. They left gaps in the lines, but the men in gray never faltered. The gaps were closed again and again, and on and on they came, now so close that Charlie could see their grim faces.

Up and down the Union line sounded the constant crackle and roar of rifles, merged with the artillery into one tremendous

roar. There were more gaps in the Rebel lines now, and they were perceptibly shorter. After all, thought Charlie, there must be limits to what those men can take. Watching them through the eddying smoke, it seemed to him that the front line was gone, and maybe the second line, too. Still they kept coming on, now at the double. Then the gray men were over the walls and on them.

Charlie was in there with the rest, swinging his saber, fighting hand to hand, all fear forgotten, made with battle lust to kill and kill and kill. Suddenly, a smoke-blackened gray coat appeared directly in front of Charlie, a pistol aimed directly at him. The next moment the man in gray didn't seem to have any head. He reeled backwards and was gone. Glancing sideways, Charlie saw Sergeant Miller, his saber dripping, turn to meet another antagonist.

Then as suddenly as the men in gray had come over the wall, they were gone, killed or literally thrown back over the breastworks. What was left of them could be seen drifting in little groups of two or three down across the valley strewn with the dead and back up the slope of Seminary Ridge. Pickett's Charge was over, and also the Battle of Gettysburg.

That night, as if Heaven would wash out the horrid stains made by fighting men, it rained so hard that Rock Creek became a flood and overflowed its banks. Hundreds of the wounded, before they could be moved, were drowned. That night, also, Robert E. Lee gathered his broken forces and began the sad trek back to his own Virginia, while the Union forces lay still and licked their own wounds, too shattered themselves to follow Lee and finish the war.

(To be continued)

# CHOCOLATE CAKES...

From HAZEL-ATLAS GLASS CO.,  
Wheeling, West Virginia

To each of the ten high State winners: One case of Hazel-Atlas quart Seal-All Mason Style Jars.

**W**HEN top winners in the finals of our big statewide Chocolate Cake Contest show off their prizes next fall, each of them will be able to say proudly, "I baked a cake!"—for those will be the cakes that win most of the prizes pictured and listed on these pages.

The contest, sponsored jointly by AMERICAN AGRICULTURIST and the New York State Grange, started last February in the Subordinate Granges. Since then nearly 4,000 chocolate cakes have been entered in the local and county elimination contests. The total number of cakes is expected to rise to 5,000 by the time the finals take place at State Grange annual meeting next fall.

All New York State grangers (both men and women) are eligible to take part in the contest, with the exception of professional bakers. Each contestant must enter in the contest a chocolate cake baked in a square pan approximately 9x9x2. For the purposes of this contest, any kind of cake made with shortening and using chocolate or cocoa is eligible. No frosting, filling or icing is allowed.

## SIX GRAND PRIZES

The contestants taking part in the finals next fall will be the 53 county winners who carry off top honors in the Pomona contests. The No. 1 state winner will have first choice of one of six grand prizes; the No. 2 winner will have her

Mrs. Mabel Hebel, Home Editor  
American Agriculturist

choice of one of the remaining five grand prizes, and so on in rotation for the rest of the six high winners. All of the grand prizes pictured here are being donated by the following AMERICAN AGRICULTURIST advertisers:

Cooperative G.L.F. Exchange, Inc., Mills Division, Buffalo, N. Y.

International Harvester Company, Chicago, Illinois.

Kalamazoo Stove and Furnace Company, Kalamazoo, Michigan.

Speed Queen Corporation, Ripon, Wisconsin.

In order to facilitate delivery of the grand prizes after the state contest finals, we will send to each county winner next fall a blank on which she may list her preferences.

## ADDITIONAL PRIZES FOR STATE AND POMONA WINNERS

The TEN HIGH State winners and the 53 COUNTY WINNERS will each receive valuable merchandise prizes, as listed or pictured on these pages, from the following AMERICAN AGRICULTURIST advertisers:

American Sugar Refining Company, New York, N. Y.

Cooperative G.L.F. Exchange, Inc., Mills Division, Buffalo, N. Y.

From R. B. DAVIS CO.,

Hoboken, New Jersey

To each of the ten high State winners: One 24-ounce can Davis Baking Powder; 1 lb. can Cocomalt; 1 can SWEL; 1 Davis Cook Book; 1 set Davis Quick Mix Baking Charts.

To each of the 53 Pomona winners: One 12-ounce can Davis Baking Powder; 1 Davis Cook Book; 1 set Davis Quick Mix Baking Charts.

From COOPERATIVE G.L.F. EXCHANGE, Inc.,  
Mills Division, Buffalo, N. Y.

To each of the ten high State winners: 1 5-lb. sack G.L.F. Quality Patent Flour; 1 5-lb. sack G.L.F. Quality Pastry Flour; 1 5-lb. sack G.L.F. Vitafed Flour; 1 5-lb. sack G.L.F. Pancake Mix; 1 2-lb. sack G.L.F. Cake Flour.

To each of the 53 Pomona winners: 1 5-lb. sack G.L.F. Vitafed Flour; 1 5-lb. sack G.L.F. Quality Pastry Flour; 1 2-lb. sack G.L.F. Cake Flour.

## SIXTEENTH AMERICAN AGRICULTURIST

From COOPERATIVE G.L.F. EXCHANGE, Inc.,  
Mills Division, Buffalo, N. Y.

To one of the six high State winners: A General Electric Super-Powered FM-AM Radio, Model 408.

From INTERNATIONAL HARVESTER CO.,  
Chicago, Illinois

To one of the six high State winners: Model HA-92 International Harvester Refrigerator with freezer locker compartment for storage of up to 50 pounds of frozen foods.

From COOPERATIVE G.L.F. EXCHANGE, Inc.,  
Mills Division, Buffalo, N. Y.

To one of the six high State winners: A Zenith FM-AM Symphony Radio.

# Will Earn These PRIZES!

Mrs. Herbert Thomsen, Poughkeepsie, Chairman of State Grange Service and Hospitality Committee.

R. B. Davis Company, Hoboken, New Jersey.  
General Foods Sales Company, Certo Division, New York, N. Y.  
Hazel-Atlas Glass Company, Wheeling, West Virginia.  
International Milling Company, Minneapolis, Minnesota.

The prizes for county winners are being shipped this month to Pomona Service and Hospitality Committee chairmen for distribution to winners.

### CASH PRIZES

State Contest winners will also receive over \$250 in cash from AMERICAN AGRICULTURIST and the New York State Grange. Each county winner taking part in the finals next fall will receive a \$3.00 entry prize from the Grange, making a total of \$159 in entry prizes.

The AMERICAN AGRICULTURIST cash prizes, totaling \$100, will be divided as follows among the 27 highest state winners:

First .....	\$25.00
Second .....	20.00
Third .....	15.00
Fourth .....	10.00
Fifth .....	5.00
Sixth .....	3.00
Seventh .....	2.00
Eighth to 27th, \$1 each .....	20.00

From GENERAL FOODS SALES CO.,  
Certo Division, New York, N. Y.  
To each of the ten high State winners: \$2.00 in cash.

If you go to State Grange annual session this fall, don't miss these two outstanding exhibits: The exhibit of the 53 chocolate cakes entered in the finals of this contest, and the exhibit of the prizes for state winners. Last year's exhibit of the bread contest prizes, at the Mark Twain Hotel, in Elmira, N. Y., Grange headquarters during the annual meeting, drew all eyes.

Nearly 1,000 Subordinate Grange chairmen of Service and Hospitality Committees and 53 Pomona chairmen have charge of the local and county contests under the leadership of Mrs. Herbert Thomsen of Poughkeepsie, N. Y., chairman of the State Grange Service and Hospitality Committee. The other two members of the state committee are Mrs. Ola Scudder of Fleischmanns, N. Y., and Mrs. Charles Arnold of Bergen, N. Y. AMERICAN AGRICULTURIST's home editor, Mrs. Mabel Hebel, is handling contest details for this publication. The chocolate cake contest score card was devised by Miss Lillian Shaben of the New York State College of Home Economics. Ten thousand copies of it were printed by AMERICAN AGRICULTURIST and distributed to Subordinate and Pomona granges.

This contest is the 16th annual baking competition which AMERICAN AGRICULTURIST and the New York State Grange have sponsored together. In past years, Grangers have baked bread, yeast rolls, gingerbread, doughnuts, sugar cookies, molasses cookies, white cake, and other good things, but according to one Grange brother, the chocolate cake contest is the most popular of all (at least with the men, who never seem to get enough chocolate cake!).

From INTERNATIONAL MILLING CO.,  
Minneapolis, Minnesota  
To each of the ten high State winners: One 25-lb. sack of Robin Hood Flour.  
To each of the 53 Pomona winners: One 10-lb. sack of Robin Hood Flour.

From AMERICAN SUGAR REFINING CO.,  
New York, N. Y.  
To each of the ten high State winners: The Domino Overnighter (overnight case) containing 11 different packages of Domino Pure Cane Sugar.  
To each of the 53 Pomona winners: A Special Domino Prize Pack containing 3 different packages of Domino Pure Cane Sugar.

## NEW YORK STATE GRANGE BAKING CONTEST

From SPEED QUEEN CORPORATION,  
Ripon, Wisconsin  
To one of the six high State winners: A Deluxe Console Speed Queen Ironer.

From SPEED QUEEN CORPORATION,  
Ripon, Wisconsin  
To one of the six high State winners: A Heavy Duty Speed Queen Washer, and one year's supply of CHEER.

From KALAMAZOO STOVE AND FURNACE CO.,  
Kalamazoo, Michigan  
To one of the six high State winners: A Kalamazoo Gas Range, Model DL-147, or winner's choice of Kalamazoo Combination Range.

## SUNNYGABLES NOTES

By John Babcock

**T**HE LATEST crop predictions point to normal development for the nation as a whole. There is not quite as much acreage devoted to wheat and corn as the government would like to see, but what there is seems to be coming nicely as of June first. What will happen if we run up against a season of bad weather? I've no reason to believe we will, other than the fact that the law of averages is bound to catch up with us sometime. The past few years—particularly those when the demands for food production were the heaviest—have been very favorable growing years.

There are still a lot of decisions in farming that are guided pretty much by hunches. We're half way gambling on a pretty dry year at Sunnygables. It leaves us feeling better that we do not have too many cows, though there were times this Spring that we thought we should buy more. Then, too, we have started irrigating pastures this year almost six weeks earlier than normal.

Farmers in the Northeast get hit first, no matter where large crop failures appear in the nation. As a grain deficient area, we soon run into heavy price competition for much needed Western feed. This season's high demands for plenty of feed to support a defense economy make it more important than ever that we raise as much good forage as we can, and that we scrape together every bit of home-grown grain.

It may not be a bad crop year for the United States, but the odds favor one. Sunnygables is going to stay in a position the nearest to self reliance that is possible.

### JACK STANDS CORRECTED

Monroe Babcock, who lives on the other side of Ithaca from us, is no relative, but I'd be glad to claim him. He's one of the most successful poultrymen in the entire country. He made his reputation by good judgment and hard work.

In April, Jack Conner quoted Monroe as saying that a young man is a poor risk as a poultryman. Monroe comes back here in strong defense of the young fellows who are making a go of the poultry business. He also adds a comment about silage which I am passing along:

"Hello, Johnny;

"Here's a fan letter to let you know I read your 'Kernels, Screenings, and Chaff.' I would like to correct an impression that Jack Conner left in his little item in the last issue. He quoted me as saying that older people take better care of chickens than younger people do.

"I believe I told Jack a year or two ago that when you hire a man

to take care of chickens, hire an older man. When you hire a man to run farm machinery, etc., take on a younger fellow and try to slow him down to a point where he won't break the machinery. I think that the average hired man who is over 45 is a better poultryman than the one who is young. The fellow who is young wants lots of action and lots of zip and a minimum of fussing around. The older fellow, even when over 60, will take better care of chickens because it is, to some extent, a detailed and puttery job. Therefore, as a rule, I think if you want to hire a man to take care of chickens, hire an older one.

When it comes to the man who owns the chickens taking care of them, I don't think there is any difference between an older man and a younger man. Some of the best poultrymen I have seen are young fellows between 20 and 25 who have grown up through 4-H and FFA work, and some of them are crackerjacks.

"Of course, I will have to admit, begrudgingly perhaps, that women, as a whole, take better care of chickens than men do, especially on raising the little chicks. I believe it is mother instinct and a kind heart.

### Good Silage and a Clean Pipe

"Since I am a chicken man, you would naturally expect I would have some cockeyed ideas on grass silage. We have a lot of grass, and therefore we make some into grass silage and some into hay. We mix 300-400 pounds of ground oats into a ton of grass silage. These oats are dumped into the blower as grass silage is dumped in from the truck. I think that this may be a little expensive but it grows beautiful calves and it keeps our Angus cattle in wonderful condition. I think it makes grass silage comparable or better than corn silage, although I have no figures on this.

"By doing this, it allows us to let our corn dry in the field and we use it as husking corn. When we make grass silage, at the end of the day we throw a couple bags of cracked corn into the blower and let it rattle up through the pipe to clean out the juice and ground oats that have become stuck on the sides of the pipe. Since we have done this, we have never had a clogged pipe the next day."

### CUSTOM WORK

A good agricultural engineer tells me that it costs \$8 an hour to use a big tractor only 25 hours a year. That's without counting fuel, labor or lubrication. It costs only 45 cents an hour when the big tractor is used 300 hours a year.

Boots was fortunate enough to get his own oats in early this year. All in all, he has about 70 acres of wheat and oats. The wheat goes for cash, the oats for next winter's dairy grists.

—Photo by C. Hadley Smith

Johnnie Conner, like his father, seems to be a better supervisor when it comes to gardening than he is a worker. Jean has him strapped in his sulk (or do they call it a stroller?) while she gives the strawberries a last going over. Head gardener, Marcella Yaple, gets credit for the green thumb that made new strawberries thrive. Across the fence is Jack's irrigation system sharing its water with pasture and garden. An early Spring drought made watering necessary way back in early May.

Once his own work slacked up, and before silo filling started, Boots hired out both his tractor and brother on custom work near his farm. The little boost in cash income helps, and Boots is getting the most out of his high investment farm equipment.

Most farmers don't care to take advantage of custom work. They don't have enough control over the timeliness and quality of the work. There is a point, though, where the high cost of ownership more than compensates for the inconveniences of custom work.

### CREEK FENCES

Three creeks run through Sunnygables Farm. One is the main Inlet to Cayuga Lake. Another leads down from the Enfield Glen portion of Tremman State Park. The third is a small spring-fed tributary to the Inlet which we call Lickbrook. This comes over two waterfalls on the farm, one of them well over 100 feet high.

While these water sources supply all the water we need for pasture with plenty left over for irrigation, they present a fencing problem every year. Meandering as they do through the valley, flash floods put them over their banks and take fences out with them. From time to time we have attempted to hang fences from cables strung between two trees on each side of the creek. These cost like the dickens, and a king-size flood takes them out too.

### CHEAP POSTS

About the best we can do is to go out at the start of the grazing season and string barb wire across, figuring on the fence going with the next flood. Steel posts are about the only thing we can drive in the stony creek bottoms. We stand to lose 10 or a dozen posts with each flood, along with two or

three days' hard work. With either ingenuity or investment, we have been able to lick most chronic problems of this nature. The cheapest and easiest way to handle the creek fencing problem, however, seems to be to replace them as cheaply as we can when we have to.

### COMPENSATION

One crop we get from high waters at the farm is plenty of good, washed creek gravel. I don't know how many times a shovel has moved into the short stretch across from the barn to remove upwards of 100,000 yards. Good quality washed gravel like this is very desirable for "fill" in road construction, and has found good farm use.

With all the trouble our creeks give us with fencing, washed fields and receding banks, I'd hate to see them gone. After all, we have fishing, a new swimming hole after every flood, and the pleasure of watching a good dairy cow standing knee deep in crystal clear water on a hot day.

**SAVE THAT SILO**

**SAVE MONEY TOO!**

**YOUNG PRODUCTS CO.**  
DEPT. 2-G  
2605 Elmhurst, Detroit 6, Michigan.

**Service Bureau**

By D. M. SPAULDING

**OVERCHARGED**

Two men came along and offered to inspect our septic tank and cesspool free of charge. Both tank and cesspool needed attention. The men would not give me an estimate of the total cost, but said they would charge \$4.65 per hundredweight. I knew nothing about such things, and the bill finally came to \$362.50. I persuaded them to reduce this to \$350.00, which I paid with two checks. However, after they had gone, I realized this was a lot of money for such a job. I stopped payment on the checks and reported this deal to my lawyer. He is trying to get in touch with these fellows.

We tried to check on these men, who were supposed to have come from Watertown. We were told they were not local people, but probably were a couple of the migrating workers living in trailers outside of Watertown, N. Y.

We are mentioning this here in the Service Bureau so that others can be on the lookout for these men. The wise thing to do would be to hire any such necessary work done by a local outfit you know to be reliable. In addition, a definite price should be agreed on for any such job before the work is started, and terms of the deal should be put in writing. Then there is no chance for misunderstandings later.

—A.A.—

**PERSONAL LOANS**

I read an ad of a concern out west that claimed they would loan money on a personal note. I wonder if you could check on this concern for me.

We did check and found the firm had a good reputation. In this case, however, it seems that the real question is as to the advisability of getting a loan from such a source. We raise that point because of the interest rates. The rates charged by the outfit in question are not illegal; but, as is the case with most such loans which have been called to our attention, the interest is high. For example, if your application is accepted, you can borrow \$100 and pay it back in 12 payments of \$10.07.

If you ignore all of the inconvenience and assume that you have the equivalent of the \$100 for about half the time, at the end of 6 months the interest rate will be a little better than 10%. Figure it out for yourself. On that basis it doesn't seem like too good business to borrow money for the purchase of anything you can do without, and foresight might avoid getting into a situation where it would be necessary to meet obligations already incurred.

—A.A.—

**REWARD RULES**

We recently found a number of our 4-month-old chicks killed and the rest missing. Is there anything you can do for us?

Letters from subscribers occasionally indicate their belief that we can locate stolen property or help to bring thieves to justice. Those are matters that are outside our province and should be taken up with local police officials or the State Police. AMERICAN AGRICULTURIST does offer a standing reward of \$25 for information leading to the arrest, conviction and imprisonment for at least thirty days of cattle or poultry thieves. A similar reward applies to imprisonment of persons who defraud or attempt to defraud AMERICAN AGRICULTURIST readers. In the case of poultry, the reward is paid where poultry (chickens, turkeys or ducks) valued at \$25 or more are taken.

Claim for the reward must be made promptly—not later than date of conviction. There must be prominently displayed on the subscriber's property a Protective Service sign. In case more than one person gives information or assistance to the police, the reward is divided equally.

**"this will help pay those extra expenses"**

Jessey Hart of Spencer, N. Y., was killed when his car sped out of control on a curve and crashed head-on into a tree. His widow, Lula Hart, received the \$1000.00 North American Accident Ins. Co. check from her attorney Otis Gardner who settled the estate.

Mrs. Hart wrote saying: "Having received the full amount of my husband's policy of accident insurance, I would be ungrateful, did I not acknowledge the courteous and considerate treatment received by me from your Company. I also appreciate the promptness with which you have taken care of the matter. This has been of real benefit to me."

POUGHKEEPSIE, N. Y.

**That's Clifford Bower on that tractor** giving me the high sign. I'm going to fill his tanks, drop off some Atlantic Motor Oil and Lubricants he asked for--and he can keep right on working.

And it's that new Atlantic truck I'm driving that makes this possible. Here, let me show you why.

## YOU KNOW WHAT YOU'RE GETTING FROM YOUR ATLANTIC FARM SERVICEMAN

**See these meter ticket printers?** They measure exactly how much gasoline, tractor fuels, kerosene or fuel oils I deliver and stamp the amount on the delivery ticket. Another thing, there's a tank and hose for gasoline and another for oil. So I can deliver both with absolute safety.

**Here I am setting off** some Atlantic Motor Oil and Lubricants. I've got everything that Cliff wanted--in the quantity he wanted. And I'm going to be able to do the same thing for the next stop... and the next...and so on. Because these new trucks hold plenty!

**And when Cliff and his wife** check over my delivery, they have a stamped ticket and an itemized bill. Yes sir, they've got a complete record of what they're getting. Isn't that the kind of service you want? You can get it from any of these new Atlantic trucks. But it would be a good idea to call right away. Here are the numbers to call--pick the one that's nearest.

Albany	Rensselaer 4-7138

FOUNDED 1842

THE FARM PAPER OF THE NORTHEAST

"Daddy, where's our cow?" says little Johnny to his dad, John Pshenesky, who with his two brothers and father, Nicholas Pshenesky, operates a 340-acre dairy farm at Sheffield, Mass. The cow shown at right, recovered from the rustler who murdered a State Trooper, was stolen from the above empty stanchion May 30. Note the bloody ear of the cow where the rustler ripped out the identification tag before abandoning her.

## Cattle Rustling Leads to MURDER

**B**EFORE daylight last Memorial Day morning, a light truck turned off Route 41 near Sheffield, Massachusetts, onto a dirt road and along it to a gravel pit  $\frac{1}{8}$  of a mile off the highway.

With the truck safely out of sight of chance passers-by, the men walked across a pasture to the rear of Nicholas Pshenesky's barn less than 50 feet from the highway. Here they opened an obscure barbed-wire gate opening into the pasture, went into the barn and stole two of the best milk cows out of a string of 33. There were at least three men involved, judging by the tracks around the barnyard. They seemed to know their way around the barn and through the hard-to-find gate, but the tracks indicated that they experienced difficulty in leading the animals.

At 6:30 a.m., when Pshenesky and his sons went down to the barn to milk, they noticed the two empty stanchions and discovered fresh tracks leading through the dew-covered pasture in a straight line to the gravel pit. Massachusetts State Troopers at Lee were on the scene within an hour, but the trail died where the thieves' truck regained the highway.

This scene has been enacted many times in the Northeastern States in the past year—12

times in New Hampshire, 18 times in New York, 15 times in Vermont, and at least a dozen times each in Pennsylvania and Massachusetts.

But this cattle theft took a different twist—it led to murder!

Thursday, June 14, Corporal Arthur M. Diffendale, 33-year-old New York State Trooper, on a city street in Oneonta, New York, stopped the truck that carried the stolen cattle away from the Pshenesky farm. The driver stepped down from the cab with a rifle in his hand. As the surprised trooper tried to twist out of the way and go for his own gun, the thief fired, killing the trooper instantly with the one blast.

There ensued one of the greatest manhunts in the records of the New York State Police. Troopers found the abandoned truck within an hour. Grazing alongside it was the cow that had been on the truck. Its tag had been ripped out of its right ear. When they found the truck had been stolen from an interior decorator in Newton, Connecticut, and then found that its tire tracks checked exactly with those found in the gravel pit at Sheffield, Massachusetts, it became an interstate crime and the forces of the FBI went to work alongside troopers in the states throughout the Northeast.

(Continued on Page 11)

## REWARD for Jailing RUSTLERS

**B**EEF PRICES, and especially black markets caused by price controls, are rapidly increasing cattle rustling or stealing from farmers. For an account of the seriousness of the situation and the high losses to farmers, read the article on this page.

For many years American Agriculturist has paid rewards to those furnishing evidence that has led to the arrest and conviction with jail sentences of criminals stealing cattle from farmers. Because of the rapid increase in cattle rustling, and in order to help stop it, between now and the end of 1951 American Agriculturist will increase our reward to \$100 for evidence leading definitely to the arrest, conviction and jailing for at least 30 days of cattle thieves.

## A Plan for ACTION

If you have cattle stolen:

1. Notify the State Troopers or Sheriff immediately. Your case may give just the evidence necessary to catch the thief.
2. Tell the officers every detail you can remember. A thief usually follows a definite pattern. Some little peculiarity you may notice may identify him.
3. Keep away from the scene of the theft and keep others away until the officers have seen it. Your footprints may cover up important evidence.
4. If you see footprints or tire marks, cover them carefully to preserve them for the officers.

Even though you have lost no cattle:

1. Check on them frequently, especially dry stock in back pastures.
2. Be able to make positive identification of your animals. Have an accurate record of all your ear tag numbers. If you sell, record name of buyer.
3. Jot down the license number of any strange trucks or when the driver follows an unusual course such as parking without apparent reason.
4. If you see anyone with a cow that's had her ear tag tampered with or torn out, have nothing to do with it but notify some law enforcement officer immediately.

Law enforcement officers are relatively few in country areas and there are many demands upon their time. Your vigilance may stop cattle stealing in your area. If the evidence you give results in the conviction and imprisonment of someone who has stolen cattle from an *AMERICAN AGRICULTURIST* subscriber, you will be eligible for a reward of \$100 from *AMERICAN AGRICULTURIST*. Read the story on this page for details.

# *Rich Returns from* **GREEN ACRES**

*Fertilization of pastures or meadows is the  
cheapest way to increase your feed supply*

**H**AY and pasture are just naturally the backbone of dairy farming in the Northeast and they produce the most economical feed nutrients for the dairy herd. Since roughage can supply the dairy cow with 80% of her digestible nutrients, a fertility program pays for itself many times over in the additional nutrients it produces.

### *Three Essentials for More Grass*

**Lime**—Use it any time you can. On many dairy farms that time is now—right after the first cutting.

**Phosphorus**—Gran-phosphate can also be applied now to both pastures and hayfields. If desired, the fields can be top-dressed with manure next winter.

**Potash**—For best results on legumes use a grassland fertilizer such as G.L.F. 0-20-20 or 0-19-19 plus borax. These grades supply 20% or 19% respectively of both phosphoric acid and potash

Cooperative G.L.F. Exchange, Inc., Terrace Hill,  
Ithaca, N. Y.

## **G.L.F. Plant Foods**

**CHAMPION U. S. DAIRY JUDGING TEAM**—Maryland's top 4-H dairy judging team that is representing the United States in the international contest in England on July 4. Coaching the team are John L. Morris (far left), Extension dairyman at the University of Maryland and Roscoe N. Whipp (holding heifer), assistant agricultural agent of Montgomery County. Team members (from left to right) are Janice Palmer, 19, Olney; Robert Barton, 20, Queen Anne; Barbara Riggs, 18, Gaithersburg; and Glen McGrady, 17, Rising Sun.

Barbara Riggs of Gaithersburg, Maryland, and John Stryker of Neshanic, New Jersey, National Holstein 4-H Champion girl and boy for 1950. Champions are named each year by the Holstein-Friesian Association of America on the basis of years of experience and achievement, and with particular emphasis on the foundation laid for future work with Holsteins.

**NEIL MUTCHLER** of Cogan Station, Lycoming county, Pa., (left) receives National Dairy Products Corporation award from L. O. Pletcher, fieldman of Sheffield Farms Company. Mutchler ranked second among five Pennsylvania winners and received \$25 and a plaque.

**Robert Carey** of Cayuga County who has been chosen 1950 New York State Guernsey champion.

Sheep are admirably suited to most Pennsylvania farms, says William B. Connell, shown above, who concluded 33 years as extension livestock specialist at the Pennsylvania State College June 30 when he retired. On June 18, Pennsylvania livestock interests honored him at a testimonial livestock day on the campus.

sell me  
anything but

**WEEDONE®**

**BRUSH KILLER 32**  
**FOR AN ALL-ROUND CLEAN UP**

**"The butoxy ethanol ester of 2,4-D and 2,4,5-T. It's got super-killing power—but kills only where you aim it!"**

"A clean farm is a productive farm. That's what I found out when I started using Weedone Brush Killer 32. It kills bramble and brush—makes productive pasture out of land the stock couldn't use. It

clears fence rows, bottom land and roadsides of brush that robs nearby crops of moisture and plant food, while giving shelter to harmful insects. It clears irrigation ditches of choking weeds. And it kills dormant plants just as well as growing plants."

**FOR ORCHARDS...TO PROTECT  
PICKERS AGAINST POISON IVY**

You'll pick your apples more easily and safely by cleaning out poison ivy *before* harvest. The modern sod floor quickly gets infested with poison ivy, but Weedone Brush Killer 32 kills it right out to the root tips, and without harming grasses. *Varieties other than Winesap are not affected by this low-volatile brush killer unless it is sprayed directly on them.*

**KILLS OVER 100  
WOODY PLANTS**

Brambles (blackberry, raspberry), poison ivy, poison oak, choke cherry, certain species of oaks and pines, wild rose, osage orange, willow, wild cherry, hickory, buckbrush, sagebrush, elderberry, coralberry, honeysuckle and many others, as well as thistles, knapweed, rayless goldenrod and other perennial weeds.

**Kill brush and stumps any time of the  
year with WEEDONE Brush Killer 32.**

# THE EDITORIAL PAGE

## IMPORTANT DATE

**T**HE New York State Board of Regents and the State Department of Education are trying to get parents and taxpayers to take more and more interest in their local schools and in determining educational policies. They want to make grass-roots government and education work. But it is sometimes discouraging that so many people refuse to assume those responsibilities. For example, only a small percentage of voters attend their local school meetings, although these meetings are still one of the most democratic institutions we have left in America.

On Tuesday, July 10, the second Tuesday in July, 320 central school districts in New York State will hold their annual meetings. If you live in one of these districts, won't you mark the date on your calendar and plan to attend and take part?

## THE LIVES OF OUR CHILDREN ARE AT STAKE

**C**OMMITTEES of laymen in different localities, concerned about the safety of their children on the streets and highways, are trying to do something about it. These citizens' committees have been responsible for setting up some safety zones where needed; for holding training schools for bus drivers; and for other activities to insure the safety of school children. But they cannot do the job alone. They should have the support of the county sheriff's office, the State police, and the courts. There must be strict enforcement of the laws against reckless drivers, particularly when the lives of children are in danger, as they are when a careless driver passes a standing school bus, either way, without stopping.

## WHAT CONSUMERS WANT

**W**HAT consumers want is to get their food and other supplies at the lowest possible prices. So when prices seem high, it is natural for consumers to become easy marks for politicians and bureaucrats who promise lower prices if only they can have more and more power to regiment and control agriculture and business.

Mr. Cliff Carpenter, President of the Institute of Poultry Industries, shows how price controls on poultry products are not needed. "The average factory worker," says Mr. Carpenter, "in 1935 could earn enough money in 42 minutes to buy a dozen eggs. It took only 30 minutes of work in 1940 to buy a dozen, and only 25 minutes in 1950. . . And what is more important, the consumer could always get the eggs."

The whole trend in the poultry industry over the last dozen years has been toward higher production and cheaper eggs. The poultry industry—not price controls—has achieved this result. In England, consumers get one egg a month. England has all kinds of controls. In America, where high production is unhampered by controls, the average per capita consumption last year was 410 eggs.

What the consumer really needs is production and more production in all lines. Controls cut production, create black markets, and, in the long run, force prices higher.

## WHY COSTS ARE HIGH

**R**ESearch workers in the U. S. Department of Agriculture recently reported the following facts:

"If farmers would furnish the wheat in a 16¢ loaf of bread absolutely free, the bread would still cost 13.4¢.

"If the farmer gave away the beans in a 16¢ can of pork and beans, the can would still cost 14¢ at the store.

"If the dairy farmer gave away the milk in a 22¢ quart of milk, it would still cost 11.5¢.

"If farmers gave away the wool in a \$50 suit of

*By E. R. Eastman*

clothes, the suit would still cost \$40.50."

It is apparent in these figures that farmers are not to blame for the so-called high prices. The big spread between what the producer gets and the consumer pays is due principally to two causes: First, the high cost of labor; second, high taxes.

In a statement on television, Charles Wilson, Defense Mobilization Director, said recently that some of the people under him were working to develop a synthetic wool because the wool produced by farmers is selling at such a high price. Well, you can see by the above figures how poorly Mr. Wilson knows his economics, because the cost of synthetic wool would certainly make up almost all of the \$9.50 difference in that \$50 suit of clothes. If Mr. Wilson would give his support to cutting down the number of government employees and to saving taxes, he would do far more to reduce prices than all of his synthetic wool activities or his price control schemes.

## FARM POISONS ARE DANGEROUS

**C**ARELESSNESS is mainly responsible for the deaths of 600 children each year from accidental swallowing of poisons. When you add to this number the death or severe illness of adults from accidental poisoning, and the property loss from poisoned animals, one sees the need of being extremely careful in handling all kinds of poisons around the farm.

All poisons should, of course, be carefully labeled and kept separate from medicine and out of the reach of children. When filling the sprayer or the duster, take extreme care to avoid spilling the poison, and if some is spilled, cover it carefully. When you apply spray or dust, protect your nostrils so you will not breathe in the poison, change clothes that are worn during the work, and, of course, wash your hands and face frequently and thoroughly.

## YOU CAN'T FOOL WITH HEART DISEASE

**A**LMOST every time you pick up a paper you read of some friend who has died suddenly because of a heart attack. Heart disease is a killer, but many who have it can perhaps live longer with the disease than without it if they are wise enough to accept their handicap and adjust their lives accordingly. Here are some points to remember:

1. If you are 40 years or over, get a complete physical examination at least once a year.

2. If the doctor tells you that your heart is affected, if you value your life and your happiness, never put it under severe strain. Slow down. Under no circumstances get into a hot haymow to mow away the hay, or on to a hot roof.

3. Be very careful about lifting.

4. If you have heart trouble, you just can't afford to get angry, or to get over-excited about anything.

5. Watch your eats, particularly avoid heavy meals. Overeating puts a strain on the heart and adds unnecessary fat. Doctors point out the dangers to health from overweight. The death rate is 1/3 higher among people whose weight is 20% above the average. The death rate from heart disease is 50% greater with people who are overweight. For every inch the waist measurement exceeds the chest measurement, the person may subtract two years from his life expectancy. Why do people get fat? The Medical Society of Pennsylvania gives the answer in one short sentence: "They eat too much." Why do they eat too much? Authorities agree that emotions have much to do with overweight. It seems to furnish consolation for the frustrated person. There is only one answer to keeping your weight

down, that is, shove back from the table!

6. Lastly, be careful not to get over-tired. Rest at frequent intervals. The alternative to these suggestions is death.

## TO CONTROL FLIES

**N**EXT TO DRY, short pastures, there is nothing that will cut down milk production faster than flies. Several years ago when DDT became available, dairymen thought they had flies pretty well licked. Unfortunately, however, as time goes on, flies develop resistance to any insecticide, and it wasn't too long before DDT lost some of its effectiveness. Also, government authorities clamped down on its use, claiming that when cows were sprayed with DDT it actually appeared in the milk.

Lindane, which does not appear in the milk, largely took the place of DDT, but last year some farmers reported poor results. This may have been due to the fact that a thorough job was not done and not enough applications made. About three weeks is the length of time that Lindane will control flies, and that means at least three or four applications during the season.

The mixture should contain 10 lbs. of the 25% wettable powder or 1 gallon of the 25% emulsifiable Lindane to 100 gallons of spray. Keep the spray out of the mangers and the drinking cups, and away from all cattle feed. Apply it thoroughly, but stop before it starts to run off and make puddles on the floor.

Cleaning up the places where flies breed is just as necessary as killing them off after they hatch.

## HELP YOURSELF

"The other evening as I was driving to Buffalo, I stopped at the Esso station on the east side of Batavia to get gas. They have both white and chocolate milk in half-pint bottles in their Coca-Cola machine, and apparently have had for some years. The attendant told me they sell as much as three cases of milk a day in the summer, and about a case a day in other seasons. They have found greater profit margins on the milk than on the coke, and seem enthusiastic about the system."

—*Ralph A. Eastwood*

**E**VERY dairyman who reads this is urged to take it to the station where he buys his gasoline and oil and urge the manager at least to give this plan a trial. It will cost him nothing; it may add materially to his income. He can no doubt get supplies from any distributing milk company in the vicinity.

Any member of any milk marketing cooperative is hereby urged to bring this editorial to the attention of the officers of his cooperative, suggesting that maybe some good sales work could be done with gasoline stations and oil companies which might result in a big outlet for milk in the way suggested above, a plan which, if successful, would benefit the consumer, the oil company and gasoline manager, the milk company, and, last but not least, the dairyman.

The Lord helps those that help themselves. Here's a chance to do something for yourself!

## EASTMAN'S CHESTNUT

**A**READABLE little paper published by John Deere Company tells a story about two Missourians who were acting as hosts to a visiting Texan. All day long they tried to impress him with Kansas City's stockyards, packing houses, municipal auditorium—but nothing in Kansas City was as big as they had in Texas.

That night, the Missouri boys, determined to impress their guest, put two snapping turtles in the Texan's bed. Slightly irritated, he called his hosts to his room and demanded, "What's this?"

"Oh," purred one of the show-me boys, "those are Missouri bed bugs."

Getting down on his knees and scrutinizing the turtles closely, the Texan drawled:

"Just young ones, ain't they?"

# AA's Farmers' Dollar Guide

**GOOD CROPS:** May weather was sufficiently favorable to bring total U. S. crop prospects up to normal on June 1. Crop prospects are good to excellent in northern states, but only poor to fair in a large strip across the South.

**WHEAT** forecast is 1,054,000 bushels. Some private estimates are lower. First official **CORN** forecast will be July 10, but private estimates indicate acreage of 88 to 89 million. Growing conditions have been good.

In May, **EGG** production was a little below last year but 3 per cent above average. Number of laying hens was 2 per cent below last year. Farmers had 8 per cent more young chickens than a year ago but 4 per cent below average on June 1. Recent egg-feed ratio has been more favorable.

**MILK** production in May was about the same as a year ago. On June 1, milk production per cow was 11 per cent above average for the date. In the New York Metropolitan area, dealers will pay \$5.44 for July Class I milk; for June, dairymen will get around \$3.88 as estimated by Administrator Blanford.

**FRUIT:** **APPLE** crop is predicted slightly above average but below 1950. North Atlantic States expect a crop slightly above last year. Ten southern states expect over 17 million bushels of **PEACHES** compared to last year's crop of 6 million. New York has prospect for a record crop of 29,000 tons of **SOUR CHERRIES**—7 per cent above last year and 74 per cent above average. **SWEET CHERRY** forecast is 16 per cent below last year; 25 per cent below average. In eastern states, prospects are above average but slightly below last year in New York and Michigan.

**CONTROLS:** Fear of more inflation was used by Administration as one weapon to get tighter controls. Attacks on farmers and business were also used to increase misunderstandings between groups. Strategy back-fired. The issue, in doubt now, may be settled before you read this. It looks as though controls will be continued, but eased rather than tightened, and that further rollbacks will be prohibited. A few more letters from farmers and businessmen might have killed controls entirely.

More and more voters are asking, "Why doesn't the Administration practice some of the belt-tightening it is advocating for taxpayers?" A letter to your Congressman will help. Congress is showing some welcome signs of tightening up the purse strings. Your encouragement is important.

**PRICES:** "Bigger inflation" was predicted by Administration spokesmen who want more controls. The idea did not originate with economists or businessmen. Instead of continuing upward, average farm prices are 3 per cent below mid-February. Good crop prospects already mentioned will, of course, tend to prevent price increases.

In a recent GLF conference, general manager Jim McConnell said, "There is evidence that the spiral of inflation brought about by the Korean War and defense effort may have pretty well spent its explosive force." Mr. McConnell also indicated his belief that we have a better chance of staying out of total war than a year ago. He thinks business will continue at a high level, that there may be shortages of certain goods but they will not continue long enough to be serious. If Mr. McConnell is right, it looks like good business for you to buy needed supplies when they are available, even though you won't be using them immediately.

**FARMING:** The months ahead will be difficult ones in which to farm. For one thing help will be scarce, indicating the desirability of using equipment to save steps, and to avoid planning more work than can be done. One uncertainty facing all of us is changing government controls and regulations. Farmers will profit from studying the situation as it develops and changing plans whenever their judgment indicates. There is nothing to indicate any serious slump in farm prices and, barring an all-out war, nothing to indicate rapid price increases. —Hugh Cosline

## The Song of the Lazy Farmer

**MIRANDY'S** talkin' mighty strange about her good old kitchen range; she's had it since we first were wed, for many years she always said she wouldn't have another kind and that she never hoped to find a stove that worked a tenth as good as that coburner always would. She loved it so, in fact, that she insisted anyone could be a champion cook when so equipped, and when her baking fame outstripped all others in the neighborhood, she said 'twas 'cause the stove was good.

But lately she has changed her tune, and ev'ry morning, night and noon she starts complaining 'bout her range and says it's time to make a change. "I'm thru," she says, "with standin' o'er a hot old firebox any more; for that I'm getting much too old, and just as soon's the hogs are sold you're marching right to town with me to buy a brand-new stove, by gee." That sort of talk is silly stuff, I'd better slaw those hogs enough so they ain't sold 'til summer's o'er and it's not quite so hot no more. A gas or

'lectric stove, I'll bet, might save a lot of work and sweat, but s'pose Mirandy lost her touch? I do not want to risk that much.

# always in trim for the toughest jobs...

Esso Farm Products help keep farm machinery in top working order right through the heavy work seasons from early Spring plowing to late Fall harvest. And help prevent costly breakdowns. Whatever your needs — you'll find the complete line of dependable Esso Farm Products ready to help you get performance-plus from your machinery the year 'round.

## Summer Seedings of Grains and Legumes

By GEORGE H. SERVISS

**M**OST hay and pasture seedings in the Northeast are made in the spring, but in the southern half of the area a very substantial number of late summer seedings are made. There are certain advantages and also certain disadvantages to seeding in the late summer compared to seeding in the spring.

Practically all spring seedings are made with an accompanying small grain commonly known as a nurse crop. However, instead of benefiting the seeding, it competes with it for water and plant nutrients in addition to depriving it of needed light. In spite of these adverse factors, seedings made with oats or barley or on winter wheat and barley are usually successful, the degree of success apparently being greatest in the northern and cooler parts of the Northeast.

While the nurse crop does not benefit the seeding, it does shade out many weeds. Some of these weeds would have a more serious effect on the seeding than the nurse crop. The shorter and stiffer strawed oats such as Clinton and Mohawk appear to be much better varieties to seed with than tall, weak-strawed varieties. One big advantage of seeding in the spring with a nurse crop is the saving in labor.

### Disking Seedbed

In some areas, though, many farmers report that they obtain better seedings by seeding after the harvest of a small grain than by seeding with it in the spring. This is especially true in the winter wheat areas where many farmers report seeding on winter wheat quite risky. Plowing after grain harvest is not usually necessary; usually a good seedbed can be prepared with a disk or harrow.

Advantages of seeding after the harvest of a small grain are the elimination of nurse crop competition and also the competition of many spring germinating weeds. However, in some areas particularly in southern New Jersey and Pennsylvania, chickweed, which germinates in the summer, is making it practically impossible to obtain good summer seedings. This weed is a prolific producer of seed and is very difficult to eradicate, although its practical control appears to be in sight. Experimental work this spring with some of the chemical weed killers now available looks very promising. It should be remembered that 2-4D is not effective against chickweed, but is very injurious to alfalfa and the clovers.

Certain crops do better when summer-seeded than others. Smooth brome grass and timothy usually do very well but orchard grass is likely to winter-kill, and spring definitely appears to be the best time to seed it. Alfalfa appears better adapted to summer seeding than the clovers, with the possible exception of ladino. On land that is not well drained, it should be remembered that these late seedings of alfalfa are very subject to heaving.

When it comes to birdsfoot trefoil, we have our fingers crossed on summer seeding. It is often, but not always, a very slow starting plant and it appears logical that many seedings would not be well enough established by winter to survive in good shape. Nevertheless, successful seedings have been made in New York State in August.

### Nitrogen Needed

When making summer seedings, I definitely feel that the fertilizer should contain some nitrogen. It is essential that the plants become well established by winter, and some nitrogen in the fertilizer will get them off to a quicker

start. For most conditions, 400 to 500 pounds of 5-10-10, 4-12-8, or 6-12-6 should be quite satisfactory. Unless the new row seeding method is to be tried, this should be applied broadcast and harrowed in.

Row seeding of hay and pasture legumes appears very promising as a method to get better summer seedings and also reduce the proportion of failures. The idea is not new to agriculture. The principle is merely the placing of a small amount of fertilizer within quick reach of seedling plants. Vegetable crops growers dissolve fertilizer in transplanting water to get newly set plants off to a quick start. Farmers also generally apply a small amount of fertilizer in the row for corn to accomplish the same purpose. However, only a small amount of fertilizer can be safely placed near the seed, particularly in the case of hay and pasture seeds.

### How To Do It

Row seeding of hay and pasture crops with fertilizer localized near the seed can be accomplished with the ordinary grain drill. The chief modification needed is to buy rubber tubes that will fit on the grass seed tubes and extend to the hoes or disks of the drill. The tubes should be fastened to the rear of the hoes or disks so that the seed will drop over the fertilizer band after soil has first covered the fertilizer. About 150 pounds of fertilizer per acre is enough to apply in this manner; the remainder should be broadcast. The seed can be adequately covered by rolling or cultipacking. This method appears will worthy of a trial on at least part of the acreage to be seeded, particularly if difficulty has been experienced in obtaining good summer seedings.

No discussion of seedings would be complete without stressing the importance of adequate liming. Failure to use enough lime is probably the number one reason for seeding failures in the Northeast. There is only one way to know whether or not lime is needed, and that is by a soil test.

— A. A. —

### RYEGRASS AS A COVER

**O**NE of the sound soil management practices that is not used as extensively as it should be is the use of ryegrass for cover crop purposes. Ryegrass, of course, does not add nitrogen to the soil as does clover or alfalfa but it does conserve nitrogen that would otherwise be lost by leaching during the fall and early spring. It also greatly reduces erosion losses and helps maintain the soil in a desirable physical condition.

We are not sure if it pays to seed ryegrass in corn if the land will be fall plowed. But where spring plowing is planned, we feel sure its use is sound in corn and many other crops. Some growers are finding it excellent fall pasture where the corn is harvested in early September. In such situations, its value for pasture appears to be worth the cost of the seed. In corn, the proper time to seed it is at the last cultivation. The usual rate of seeding is 15 to 20 pounds to the acre.

In vegetable farming areas it is usually seeded after the harvest of a crop, providing this is by September first. After September first, winter rye is better in most of the Northeast.

On these truck farms where maintenance of soil organic matter is a difficult problem, the ryegrass is often fertilized. The fertilizer is generally applied as a top dressing after the stand is obtained.

## FROM THE *Editor's Mailbag*

### ANIMALS NOT ALWAYS LIVESTOCK!

IN 1946 I engaged in the raising of small animals such as mice, rats, guinea pigs, rabbits, cats and dogs. These animals are primarily used for research. We have been able to build up to the point where we now employ three persons.

A short time ago a member of the Wage and Hour Division of The Federal Department of Labor dropped in and informed me that I would have to comply with the provisions of the Fair Labor Standards Act, particularly as it applies to minimum wages and overtime payments. We had been under the impression that we were exempt from the provisions of this act under Section 13(a)(6) which exempts any employee engaged in "Agriculture." "Agriculture" is defined in Section 3(f) to include among other operations the "raising of livestock."

The representative from the above Division informed me that in his opinion and that of his Division, the animals we were raising were not livestock and therefore were not exempt. If they are not livestock, I certainly would like to know what they are.

Not only was I informed that I would have to comply with the Act but that in addition, I would have to pay one and one-half the minimum rate for every hour our employees had worked over 40 in each week for the past two years. This would amount to a sum that would bankrupt me and put us out of business.

While the closing of one small business and the adding of three persons and myself to the unemployment rolls is a small matter, I do feel that the precedent thus established has wide ramifications.

Certainly if this Bureau can decide arbitrarily what is an animal and what is not an animal, it will be only a question of time before they encompass the whole livestock industry to its definite detriment. Not only do I feel that they are exceeding their authority, but also definitely defeating the intent of the Act. The proposers of this law apparently were well aware of the peculiar problems incident to the raising of animals and that is why the exemption was placed in the Act.

The idea that raising animals of any type is like a factory where the doors may be shut after 40 hours and forgotten until the following week is certainly ridiculous to any intelligent person. Animals very definitely require some amount of care seven days a week.—C. K. Miller, Staatsburg, N. Y.

EDITOR'S NOTE: The above letter brings out one of the worst features of bureaucracy, namely, the interpretation of laws by people hired or appointed rather than elected.

This will be called to the attention of farm organizations and an attempt will be made to get the ruling changed. Of course any citizen can take a case like this to court, but who can afford the time or money to do that? What do you think about such a ruling?

— A.A. —

### ONCE IN A LIFETIME

I THOUGHT you might be interested in this once-in-a-lifetime experience. One Sunday one of our big Holsteins freshened, having a nice heifer calf. The following Tuesday, 55 hours later, Dr. J. V. Hills of Gowanda delivered a second calf, twin of the first, *alive*.

The first twin was average size. The second, also a heifer, was considerably larger. Both are strong and healthy and are getting along fine.—Mrs. Del. McBean, Perrysburg, N. Y.

# STRENGTHENING THE FARMER'S LINE OF DEFENSE AGAINST RECURRING DANGERS OF BOOM AND BUST

Late in May, the Dairymen's League opened at New Berlin, N. Y., a milk receiving plant described as "the most modern in the northeast." Early in June, the doors of another new Dairymen's League plant were thrown open for the receipt of milk at Chaumont, N. Y.

## 95 Modern Milk Plants Assure Year-Round Markets For Association Members

The Dairymen's League does not build milk plants merely to enlarge the chain of 95 modern plants now under its operation. Some plants have been closed; others have been combined during the last year. The guiding principle in each case is two-fold: 1—economic handling to provide the greatest return to members; and 2—strategic location of plants so that every member is assured of a market for his milk every day of the year, regardless of economic conditions.

## Protecting the Farmer's Interest in Both Boom and Bust

Assurance of a steady market may not seem important in the midst of a boom, Leon A. Chapin, president of the Association, told members at Chaumont. Yet no further back than two years ago, there were farmers in the milkshed who found themselves without a market when dealers cut them off. That time will come again, Mr. Chapin predicted. When it does, the chain of protective country plants will seem like a godsend.

Today, the big job of the Dairymen's League is to create a better understanding of farmers' problems among consumers; and to resist the imposition of unwise price controls and unfair subsidies by public officials under pressure from consumers.

In carrying out this work, the Dairymen's League renders far more service than co-operatives which only market milk. It actually serves as the dairy farmer's watch dog in Washington, Albany, Trenton, Harrisburg, and wherever the farmer's rights may be threatened. It champions the farmer's interest before governments, before consumers and dealers, and in the face of the great economic movements of supply and demand . . . of boom and bust.

## DAIRYMEN'S LEAGUE

**ASSOCIATION, INC.**

WHAT'S SO SPECIAL ABOUT THAT **AUTHORIZED** RECONDITIONED FORD ENGINE?

DO THEY REALLY GIVE YOU A NEW ENGINE WARRANTY?

**AUTHORIZED** MEANS RECONDITIONED TO FACTORY STANDARDS—IT CAN ADD 50,000 MILES OR MORE TO YOUR FORD'S LIFE.

YES—BECAUSE AN **AUTHORIZED** RECONDITIONED FORD ENGINE IS REMANUFACTURED WITH OVER 150 NEW OR COMPLETELY RECONDITIONED GENUINE FORD PARTS.

### ENJOY CAREFREE MOTORING FOR YEARS AHEAD!

New power on hills! New pep and economy! That's how an AUTHORIZED Reconditioned Ford Engine can add 50,000 miles or more to the life of your faithful Ford.

### RECONDITIONED TO FORD-FACTORY STANDARDS!

Completely reconditioned from the ground up in a Ford-authorized, Ford-inspected plant. Here you see just one of the many factory-type reconditioning machines—a multi-reboring machine. Another good reason why you get warranted new-engine performance!

### PARTS ARE GENUINE FORD PARTS!

Over 150 new or completely reconditioned Ford parts keep your Ford *all* Ford. Consider the Genuine Ford Pistons for example: best aluminum alloy . . . tin plating for better lubrication during break-in period . . . special expansion control struts for extreme heat conditions . . . accurately grooved depths to insure proper ring set. All new, all Ford!

### ONE-DAY INSTALLATION BY APPOINTMENT!

Each engine comes ready to install. Easy payment plan can be arranged. Ask your Ford Dealer TODAY, for an AUTHORIZED Reconditioned Ford Engine for years of economical motoring.

**LOOK FOR THIS EMBLEM** on the engine you buy. It's backed by the Reconditioners' warranty of 4000 miles or 90 days, whichever occurs first.

## POST YOUR FARM

and you will have the law clearly on your side. Our signs are printed on heavy fabric that withstands wind and weather and meet requirements of the Conservation Law.

# What About - - - Birdsfoot Trefoil?

## 14 VERMONT MEN, SUCCESSFUL WITH THIS LEGUME, GIVE THE ANSWERS

**S**O NUMEROUS are the questions about birdsfoot trefoil in Addison County, Vermont, that 14 local farmers have taken time to answer, out of their own experiences and observations, questions on how to get and keep a good stand of this unusual legume.

The management methods they have followed to get their successful stands are reproduced in the following article taken largely from a pamphlet they prepared for the County Agricultural Agent's office. The group responsible for the answers to the questions consists of C. H. Stewart, Chairman, Donald Clark, Erwin Clark, O. G. Farnham, Karl Field, H. A. Foster, Wayne Fuller, Edwin James, Stanley K. James, Carroll Landon, Wesley Larabee, Winston Seeley, Edgar Smith, and Seth Warner.

**What are its Uses?** It makes successful and high quality pasture, hay and silage.

**What Will It Yield?** As early cut hay, trefoil and timothy over a 7 year period averaged 5,485 lbs. per acre. Ladino timothy on the same soil over the same 7 years averaged 4,341 lbs. This was clay loam soil.

**How Many Crops Should Be Cut Each Year?** One large crop in the best haying weather of mid-summer is best. A large amount of late summer and fall pasture will follow.

**What About Lime and Fertilizer?** Trefoil is a deep rooted plant and feeds on subsoils where lime and fertility have been washed down from topsoils. It also uses minerals found in these lower soils. Subsoil tests at depths of two feet or more should be used as well as topsoil tests in considering lime and fertilizer needs.

**How to Lime and Fertilize Before and at Seeding Time.** Enough lime to raise the pH of the soil to 6, should be used, preferably a year or more before seeding if the application needed is large. Thorough mixing of the lime with the soil is important. Small quantities of lime, like 500 pounds per acre, may be applied to acid soils the year of seeding. If heavier applications of lime are used equally heavy applications of manure and other minerals should be used.

Heavy fertilizer applications at one time unduly stimulate shallow rooted competition and should be avoided. Nitrogen stimulates grass and weeds. Phosphate tends to stimulate clovers. Manure stimulates all three. Manure should not be used the first year.

On moderately fertile soils, the use of 150 to 200 pounds of 20 per cent super concentrated in bands with the seed is best. This is run at the same time the seed is drilled.

On low fertility soils, 300 to 400 pounds of 4-12-4 per acre, drilled in bands before seeding will help the new seeding get started. On lighter soils, 4-12-4 or 200 pounds of 0-20-20 per acre could be used. In both cases, drill the fertilizer crossways from the seed, and deeper so the seed will not come in contact with it.

**How to Lime and Fertilize After Seeding.** So far as practical, all minerals, including lime can very well be spread with manure. Light applications of manure, 3 to 4 tons per acre, reinforced with 150 to 200 pounds of 20%

superphosphate or 0-20-20 plus 20 pounds of borax annually will give good results on pasture, hay and silage areas. If possible the entire area of pasture, hay and silage should be fertilized annually with manure and minerals.

Annual applications of lime for maintenance can be made by adding around 200 pounds per acre to the load of manure with other minerals. Larger amounts of lime, like 500 pounds per acre, can be used where it is desired to increase the pH of the soil. Annual applications in small amounts are recommended rather than heavy top dressing far apart.

**What is the Feeding Value?** For hay, it is about equal to alfalfa, pound for pound. For pasture it is about equal to white clover. (From Morrison's Feeds and Feeding.)

**What About a Nurse Crop?** A nurse crop of oats or other grain is just another form of competition to trefoil, a slow starting legume. NO nurse crop is recommended. However, it is necessary to clip the weeds once or twice, otherwise weeds may be more serious than the nurse crop.

If the land is badly needed for pasture, or if the weeds cannot be clipped, a seeding of one bushel of oats per acre may be used. These oats should be grazed off, or cut when 8 to 10 inches high.

**What Kind of Equipment is Best for Seeding?** The cultipacker seeders are excellent. Conventional grain drills with separate grass seed boxes can be used. Tubes from the grass seed box connecting with the tubes which carry down the fertilizer and other seeds, makes it possible to band the superphosphate with the trefoil seed.

Broadcast seeding may be slower and take more seed per acre. Better results are obtained if the land is cultipacked or otherwise firmed down.

**How Should Seeding Be Done?** Be sure to inoculate the seed with birdsfoot trefoil inoculant. To moisten the inoculant, use water to which clay has been added.

Seed only on land where the old grasses have been thoroughly killed.

When using the grain drill, put trefoil seed in the grass box and set to run 3 to 5 pounds per acre. Use the smaller amount only when completely familiar with the seeder and after some experience in seeding trefoil. Use up to 8 pounds of brome grass per acre. Mix the brome thoroughly with the phosphate in the fertilizer box. Borax or potash should not be used in this way. It is dangerous if it comes in contact with the seed.

Remove drag chains and set drill as shallow as possible. One-half inch is deep enough. If there is no soil moisture at this depth, it is better to wait until after a rain, or just before one, rather than plant deeper. The inoculant lives only a short time in dry soil. Only one grass, and no other legumes should be used with the trefoil seed. Timothy and reed canary grass have been used. Brome is preferred.

**What Kinds are Recommended?** A mixture of broad and narrow leaf is always safe. Straight narrow leaf for very wet ground and pasture is good. Broad leaf is good for meadows. Narrow leaf seed from Oregon seems

(Continued on Page 17)

**Mr. & Mrs. York State Farmer:**

*Tuesday (July 10)  
is an important  
day in the education  
of your child*

★ THIS TUESDAY in 320 of New York's 411 central school districts, the annual school meeting will be held.

It is the most important day in the education of your child, because you can vote on how your children's school is run.

At the meeting in your district you will cast your vote on:

- The school tax rate
- The use of school funds
- The election of the members of the Board of Education
- And many other important policies

You'll also have the opportunity to give your views on the kind of education your child should have.

These school district meetings are one of the few remaining opportunities you have to discuss and control governmental services.

Even if you cannot, by law, vote (see column to right on "qualifications of a voter") it is important that you show your interest by attending the meeting.

Why? As Ed Eastman said:

*"In recent years we have been rapidly losing control of our affairs through centralization of government away from the localities . . .*

*"Some of these (school district duties) have been somewhat restricted, mostly by laws passed by the New York State Legislature, and have been lost to the districts—for one reason because the voters themselves have not attended meetings and taken part in school affairs and have not seen the dangers of losing 'grass roots' controls . . .*

*"But we, the people, and our local leaders are largely to blame for this sad state of affairs. We can be sure that if we don't attend to our business, somebody else will."*

#### **Why Are Your Railroads Urging You to Attend Your School Meeting?**

Your railroads are taxpayers in nearly every school district in New York State. Railroad taxes to school districts in the state paid for the education of more than 20,000 rural school children last year. But we, as corporations, have no vote in school district affairs.

(For that matter, we, as corporations, have no vote in local governments, even though we paid more than \$31 million in property taxes in New York State last year.)

It is you who have our vote . . . and since your vote will be cast for the best education of your children, we know that if you attend the meeting and vote, you will vote wisely.

And someday the excellent education which you secured for your children, because of your attention to local school affairs, will stand the railroads in good stead. For your children may become railroad employees. Or . . . more of a certainty . . . they will become good citizens who believe in free enterprise; in business such as ours which pays its own way all the way without a handout from government.

Have you been listening to the railroads' half-hour program over your Rural Radio Network? It's Lee Hamrick's York State Farmer program. It's profitable listening . . . each Tuesday, Wednesday and Thursday at 12:30 p.m. on your local Rural Radio FM station.

#### **QUALIFICATIONS OF A VOTER AT SCHOOL MEETINGS IN NEW YORK STATE**

##### **A VOTER MUST:**

1. Be a citizen of the United States.
2. Be at least 21 years of age.
3. Be a resident of the district for a period of at least 30 days preceding the meeting at which he or she wishes to vote.

In addition to the above, all voters must have at least ONE of the following qualifications:

1. Must own, lease or hire real estate subject to taxation within the district. (Where the deed or lease is joint, both persons may vote.)

OR

2. Must be the parent or a child or children of school age, providing such child or children shall have attended the district school in the district in which the meeting is held for a period of at least 8 weeks during the year preceding each school meeting. (Both father and mother may vote.)

OR

3. Not being a parent, has permanently residing with him or her a child or children of school age who shall have attended the district school for a period of at least 8 weeks during the year preceding such meeting. (In this case, only the head of the household may vote.)

**The Railroads Which Serve You in New York**

Here's your combination  
for easier, better cooking

You'll enjoy cooking with MAGIC CHEF—America's most popular gas range. The famous Red Wheel oven regulator provides exact oven temperatures—so necessary for perfect baking. Top burners give quick, even, cooking heat and are so easy to clean. And the exclusive Swing Out Broiler gives you smokeless broiling. All this and PYROFAX Gas give you the perfect cooking combination.

In fair weather or foul, PYROFAX Gas is always available—no matter where you live. Inexpensive to install, economical to maintain—PYROFAX Gas Service is the best buy for you. See your Distributor today. Let him show you how PYROFAX Gas can make your housework easier.

**More Women Cook on  
MAGIC CHEF

**State and County Fairs Offer  
Homemakers Cash and Blue Ribbons**

By MABEL HEBEL

CAN you bake a delicious pie, or sew a fine seam? Are you proud of your jams and jellies, of your cakes and bread? Are your canned and frozen foods the pride of your life? Then why not cash in on your skills this summer and fall at your local and state fairs? Thousands of dollars in premiums are being offered by fairs throughout the Northeast.

Last September I spent a fascinating afternoon in the Women's Building at the New York State Fair, watching Miss Lucille Brewer judge pies that had been entered in the "New York State Foods for New York State Families" contest. Miss Brewer has a way of getting the bystanders to help her judge. "Now what do you think of that?" she's apt to ask, and she tells me that someone in the crowd usually comes up with the right answer. When I came along, the crowd was so thick around her that I had a hard time finding a vantage point from which to watch her.

I was reminded of this the other day when I received the New York State Fair's 1951 premium book. I looked through it at once to see if the foods contest was being repeated this year, and found that it was—with several additions. The foods contest (Sept. 3, 4, 5, 6, and 7) is open to every person of feminine gender in New York State—women, teen-agers, and their young sisters, too. Two prizes of equal value will be awarded in each class in every section—one for contestants under 18 years of age, and one for those over 18 years. Classes include cakes and cookies; fruits—fresh, canned, frozen, and fruit pies; jams, jellies, preserves; vegetables—fresh, canned, frozen; frozen chicken; yeast bread, rolls, and quick breads.

The premium list contains real help for contestants in the form of score cards and standards for every section. For instance, under "fruit pies," it tells you that the judges will be looking for the following: Light brown crust, with edge of the pie only slightly browner than the rest; a pie that is uniformly round and even on top; crisp, flaky, tender crusts top and bottom; an adequate flavor of salt, and no unpleasant flavor of fat. Under "filling" (fruit), it says to avoid a thin pie; if thickening is added it should be neither stiff nor too juicy; and, finally, the flavor should be as natural as possible.

The book also gives advice for wrapping your entries (especially frozen foods), and of course complete information on classes, dates of entries, and special awards, such as the silver loving cup to be presented each day to the contestant whose entry in the foods contest is judged the "Best of the Day."

**Tips from a Winner**

One of the silver cup winners last year was Mrs. Chester Smith of Homer, N. Y., who has been carrying off Fair prizes for many years. In fact, besides winning the silver cup for her canned goods at the 1950 State Fair, she won 20 other prizes for her culinary skill, as well as prizes at her Cortland County fair. I decided to write her and ask her for some of the secrets of her success. She replied that she started exhibiting in the 4-H department of her county fair in 1930, and has hardly missed a year since then. "With me," says Mrs. Smith, "exhibiting at our Fairs is a way to earn pin money. Most everything I knit, crochet, sew, bake, can,

etc., is considered as a possible exhibit when the premium list comes out.

"In foods, care in preparation is the big thing. About the only advice I can give is to follow the standards set in the score card in the premium book. If your entry meets all the qualifications listed there, then your chances of winning are as good as anybody's. Breadmakers should be sure to bake their loaves the day before, as the judges refuse all warm loaves."

**More Success Secrets**

Miss Brewer (who will be superintendent of this year's State Fair foods contest) gave me the following helpful hints for contestants:

**Canned goods.** Follow suggestions in premium book for containers. If list specifies a pint jar, don't substitute a quart. Select a good clear glass jar; avoid a greenish one. Place label half way between shoulder and bottom of jar. Avoid a large label; it may throw a shadow on contents of jar. Canned vegetables and fruit should be as nearly like the fresh as possible. The liquid should be clear and free from floating particles.

**Jellies.** Jelly should hold its shape and quiver slightly when turned out.

**BESIDE MY DOOR AT EVENING**

By Edith Horton

Now beautiful at evening by my door,  
The little stream goes flowing toward the sea,

Between the roses and forget-me-nots:  
This is my world, oh take it not from me!  
Beyond the house the forested green hill  
Stands firmly planted to eternity,  
And cool grass makes a carpet for my feet;

Here is such peace, oh take it not from me!

Brightness, color and texture are important, and flavor should be natural fruit flavor. Straight-sided containers should be used.

**Bread.** Crust should be of uniform color all around the loaf, except possibly slightly browner on top. Don't grease crust after bread is taken from oven, because it will soften the crust and may crack it. Use the best ingredients, and a good recipe, and the right pan. A too large or too small pan may change shape of loaf.

**Care in wrapping.** Wrap just before bringing, in waxed paper, and lay in clean box, free from odors. Don't crush, don't crowd; don't break crust of bread or edges of cookies or cake. Don't use a rubber band around the wrapping.

Perhaps you're more interested in entering your hooked rug or crocheted spread than samples of your culinary triumphs, but whatever your interests—food, flower arrangement, needlework or art—you'll find classes to enter at your county and state fairs. Why not send today for the premium books and start planning just what your entries will be? If you live in New York State, you can get your copy of the State Fair premium book and entry blanks for the foods contest and other competitions by writing to Mrs. Martha Eddy, Chairman of the Women's Committee, New York State Fairgrounds, Syracuse, New York.

And don't forget, it's that extra bit of care that brings home the blue ribbon, no matter what you are exhibiting. Aim at the standards in the premium books, and, as Mrs. Chester Smith says, your chance of winning will be as good as anybody's!

## Cattle Rustling Leads to Murder

(Continued from Page 1)

Just 10 days later, Sunday morning, June 24, New York State troopers arrested Matthew A. Armer as he was driving away from his 50-acre farm near Nassau in Rensselaer County, New York, and charged him with the murder of Corporal Diffendale. He had made no statement at this writing but police are confident that they have enough evidence for a conviction. According to police, Armer is an ex-convict with a record of two felony convictions and arrests for auto stealing and an armed hold-up.

### Good Work!

The story of how they tracked the man through various market records and by license plates stolen in Hoosick Falls and Red Hook, and even by television, we will leave for the detective story magazines. However, we want to take this opportunity to commend the Troopers of the several states for their tireless efforts in tracking down the suspect. With the assistance of the FBI, the New York Bureau of Criminal Investigation, Sheriffs' departments, and of volunteer citizens, every tip and

Pa., a sedan paused briefly to drop two men in front of a barn some distance from any house. The men skulked to the rear, cut the lower wires of a fence adjoining the basement, caught two 5-months-old heifers and took them to the road. The farm is owned by Jim McConnell, general manager of G.L.F., and managed by Henry Beardsley. It was all carefully timed. The sedan had gone a mile up the road, turned around, and as it paused, so the evidence indicates, one heifer was jammed into the rear seat, the other in the trunk, and the car sped away.

Cattle rustling is nothing new. It has been with us for generations. But government price controls have added new impetus to the dirty business, and now in addition to the hazards of shortages in help and supplies, dangers of flood and drought, losses from insect pests and diseases, farmers, fearing to leave their herds unprotected, check them carefully for losses every morning, and view every strange truck with suspicion.

In Tioga County, Pa., State Troopers have checked carefully in nearby cities

Henry Beardslee of Mansfield, Pa., and the woven wire fence which was cut when two heifers were stolen. The two top wires are not cut, which is typical of many thefts in northern Pennsylvania, indicating that animals were stolen by the same men. Mr. Beardslee operates the J. A. McConnell farm. Mr. McConnell is general manager of G.L.F.

clue was followed through. We can be proud of our rural police force and we urge every farmer to cooperate with them to help stamp out rustling, which has reached a wide-spread volume right here in our own Northeast.

In Bennington County, Vermont, the rustling has become so serious that the County Farm Bureau has a standing reward of \$100 for information leading to the arrest and conviction of persons engaged in rustling livestock of any kind. This reward is matched by another \$100 offered by AMERICAN AGRICULTURIST when the farmer robbed is an AMERICAN AGRICULTURIST subscriber.

The biggest single theft in Vermont occurred at the farm of Lewis West, near Manchester, before daylight on Wednesday morning, April 11. Using a system that paralleled that used in the Pshnesky farm in Massachusetts, a truck was driven to a gravel pit across Route 30 from West's barn, the men led four two-year-old artificially-bred Ayrshire heifers across a plowed field, through a fence which they had pushed over, and into a gravel pit where they loaded them up. A few miles away at Bennington, Carl Sweet had one of his cows taken out of a barn only 50 ft. from his house.

### Stole Best Cows

All the Bennington County thefts have occurred at night, and usually the cows are taken right out of the barn, but there have been occasional losses in small pasture lots that were handy to a road. Harry Mitiguy, Bennington County Agent said that in both West's and Sweet's cases, the animals stolen were the best in the barn, "as though hand-picked by the thief or thieves."

On a dark night in Tioga County,

hoping to find evidence of beef sold at bargain prices. They have been unsuccessful.

If the outbreak of lawlessness is not stopped soon, it may become necessary for farmers in a neighborhood to organize for their own protection to set up regular road patrols after dark and to ask to be made deputies so they can legally carry guns to protect themselves and their property.

So far, there is no indication that all rustling is controlled from one central point, although that may prove to be the case. Many thefts in northern Pennsylvania have been committed by the same group or gang. The same is true in New England.

In Pennsylvania, the outlaws specialize in young heifers and there are many indications that they use a big sedan rather than a truck. They take one or two animals and make a quick get-away.

In New England, the gang seems to favor barns near gravel pits where the truck can drive in out of sight of passers-by, and where a bank is always available for easy loading.

### Result

Armer's arrest came ten days after Corporal Diffendale's murder. Another man accused of cattle stealing is awaiting trial in Topsfield, Mass. Vermont State Police records show that in the last 17 cattle thefts, they have gotten 7 convictions. If every reader takes all possible precautions to protect his own animals, keeps his eyes open for suspicious characters in the neighborhood, and cooperates promptly with police authorities, and if our judges and justices of the peace are tough enough, we'll make cattle rustling too tough even for the hard-boiled characters now engaged in the racket.

# Lighter... Faster... Tougher

It's the NEW  
**HOMELITE**  
ONE MAN  
Chain Saw

**27 lbs.,... 4 H.P.**  
**More power per lb.**  
**than any other saw**

It's the newest and the best

... lighter and easier to

handle. Yes and faster, much faster.

Cuts an 18 inch tree in 16 seconds. Cuts trees 48 inches or more in diameter. It's a one-man saw that really does the work of other two-man saws. And whether you're felling, bucking, undercutting or notching, this new Homelite Saw will give you greater output because of its easier handling, less fatigue on the operator and greater productive power.

Built and backed by Homelite, manufacturers of more than 300,000 gasoline-engine-driven units. This new, rugged, lightweight saw is the one saw that will give you more cutting with less maintenance than any other saw. We can prove it. Ask for a Free on-the-Job Demonstration.

# How Butter Prices Affect Milk Returns

**WE ARE** so often asked, even by farmers, why we are so concerned with the butter price when but little butter is made in this milk-shed. Those who don't have the background don't understand that the price of butter under order 27 in the New York Metropolitan Market is still a big factor in determining the blend price, which is what the producer receives—the actual wages of the dairy farmer.

I wrote to Mr. Cheney of the Dairy-men's League and asked for some figures. Using the March figures, he made up the table and explanation which I think are very clear. I am enclosing a copy thinking you might care to use it.

—Elizabeth R. Myers, Cato, N. Y.

1. The Class II price (fluid cream sold in the Marketing Area) is based directly on butter.

2. The Class III (manufacturing milk and cream) is based on butter for the months of March through July on either butter or the Boston Cream price for the months of August through February, whichever is higher. The Boston Cream price as a rule follows the trend of the Chicago butter price, so it can safely be assumed that a decrease in the butter price would be reflected in a decrease in the Boston Cream price.

3. The Class I-C price (fluid milk sold in non-federal markets) is priced at 20c above the blend price. Accordingly a decrease in the Uniform Price would decrease the I-C price.

Assuming that the price of 92 score butter at New York had been 10c per pound less for the month of March 1951, the effect on the prices mentioned above would have been as follows:

	Actual Price March 1951	Price if Butter was 10c Less	Decrease
Class II	\$3.863	\$3.413	\$.45
Class III	3.10	2.670	.43
Class III*	2.966	2.536	.43
Class I-C	4.57	4.13	.24
Blend	4.37	4.13	.24

\*Butter & Cheese

The actual computation for the month of March 1951, and the computation assuming a decrease of 10c per

pound in the butter price is shown below.

The price of butter does have a direct effect on the returns to the farmer. In March 1951 a decrease of 10c per pound in the butter price would have reduced the blend by 24c per hundred weight. This would have amounted to \$1,424,637.00. We estimated that the removal of the ban on yellow oleo, if it had reduced the butter price by 10c per pound, would have resulted in a decrease in the milk checks of dairy farmers selling milk under the New York order of \$12,000,000 a year.

Considerable emphasis has been placed, by proponents of oleo, on the fact that little butter is manufactured in New York State. However, as indicated above, the loss of income to the New York dairy farmer is far more direct than that resulting from the displacement of butter consumption by oleo. It does directly affect how the farmer's milk check is computed.

Actual Computation of Uniform Price  
March 1951

	%	Price	Contribution To Price
Class I-A	43.08	\$5.78	\$2.490
Class I-B	.06	5.78	.003
Class I-C	5.61	4.57	.256
Class II	10.23	3.863	.395
Class III	34.76	3.10	1.078
Class III*	6.26	2.966	.186
100.00			\$4.408
Adjustments			-.038
			\$4.370

\*Butter & Cheese

Computation of Uniform Price  
March 1951  
Assuming Butter was 10c Less Per Pound

	%	Price	Contribution To Price
Class I-A	43.08	\$5.78	\$2.490
Class I-B	.06	5.78	.003
Class I-C	5.61	4.328	.243
Class II	10.23	3.413	.349
Class III	34.76	2.670	.928
Class III*	6.26	2.536	.159
100.00			\$4.172
Adjustments			-.038
			\$4.134

\*Butter & Cheese

A 10c per pound decrease in the butter price would have resulted in a decrease of \$.236 in the blend price for March 1951. This would have amounted to a decrease of \$1,424,637.00 for all dairymen shipping to New York.

## FARMERS WORK ON 'LORD'S ACRE'

**I**N A recent issue of AMERICAN AGRICULTURIST we told the story of good neighborliness of Schuyler County, New York, farmers in helping out others who were ill or injured. In the same county and just a few miles down the road A. J. DuBois supplied 12 acres of land for a "Lord's Acre" project of the Valois community church.

The Rev. Harry Dunlap, pastor of the church, promoted the "Lord's Acre" idea locally, and when Mr. DuBois offered the land, Francis Marsh acted as chairman of a committee to do something about it. With four other

area farmers who were members of the church, short work was made of plowing the field. A few days later nine other men joined in the work by fitting the land and seeding oats and alfalfa.

The church anticipates netting about \$200 from the oats, which will be combined at no cost to the church by the local Ferguson tractor dealers, Welch and Sutphen. Pictured above on the day of the plowing are, from left: Coral Welch, James Bond, Jr., Francis Marsh, A. J. DuBois, owner of the farm, and Stuart Foote.

**STOP DISEASE BREEDING FLIES**  
AND MOSQUITOES ALL SEASON  
WITH JUST ONE APPLICATION of

**FLI-PEL** THE NEW INVISIBLE BARRIER  
THAT GUARANTEES RESULTS

**AMAZINGLY EFFECTIVE IN USE**  
You must see Fli-PEL work to realize how amazingly effective it is! Brush it on, or spray it on and your troubles with flies and mosquitoes just disappear. Fli-PEL is transparent and invisible—harmless to humans and pets, yet the invisible residual Fli-PEL deposit lasts for months. One application on screens, doorways, light fixtures, etc. literally banishes pest insects all season.

**ONE APPLICATION LASTS ALL SEASON**  
Fli-PEL is stainless, odorless, harmless! Spray your home, barn, cattle, fishing clothes, summer cottage, nursery. Use it indoors or out—wherever disease breeding flies and mosquitoes are a problem.

**BUY ON MONEY-BACK GUARANTEE**  
Fli-PEL comes to you with a money-back guarantee—your money back if it fails. Enough Fli-PEL to fly and mosquito-proof your six room home or barn all season for only

**\$2.98**

**UNITED ENTERPRISES**  
531 W. Webster Avenue Chicago 14, Illinois

Flies are known to carry and transmit dangerous diseases such as dysentery and typhoid. They are suspected of transmitting the dreaded polio virus. Now, with just one application of Fli-PEL, you can eliminate this hazard all season. Your money back if Fli-PEL fails. Don't delay—protect yourself, your family and your livestock now!

**HANDY MAIL ORDER COUPON**

## Grass Follows Grass on Pennsylvania Farm

RALPH CULVER of Laceyville, Pa., is a firm believer in grass farming. He not only believes in it; he practices it, and through some experimenting he hurdled one of the chief objections, namely, that when it becomes necessary to reseed you just have to plow and grow a cultivated crop. Ralph doesn't own a plow.

About a year ago, after a meadow which had been seeded for seven or eight years was cut, he put on 5 or 6 loads of manure, a ton of lime and 500 pounds of 0-19-19 per acre. Then he disked the sod with a cutaway harrow. The tool has 8 disks and weighs over half a ton. He went over the ground four times, so it is not a matter of saving labor but rather one of mixing the stubble thoroughly into the top soil where Ralph thinks it should be.

About the middle of August, Ralph sowed two bushels of Balboa rye and six to ten pounds of timothy. Balboa is a new pasture rye which seems to give an unusual amount of feed. Late in October Ralph turned 38 cows on 10 acres for 2 weeks.

### More Plant Food

During the winter he put on 5 loads of manure and 250 pounds of superphosphate per acre, and before the frost was out of the ground in the spring he sowed birdsfoot trefoil.

About the 25th of April he turned 38 cows in this field for 3 weeks, but they couldn't keep down the rye so it was mowed and cured for hay. It was mowed again around the 18th of June. Ralph says the birdsfoot seeding looks very good.

The same general procedure will be used to improve some pasture. On the pasture, however, brome grass will be seeded in August with the rye, and ladino will be seeded in the spring. In some years it might be all right to seed

ladino in August, but Ralph thinks the chances are better if he waits until spring.

Ralph is a firm believer in the value of humus in soil, and he goes along with those who think that it is one of the most important points in growing good crops. He goes along to the extent of feeling that the right place for decaying sod is near the surface rather than plowing it under 8 or 12 inches. On the other hand, he believes also that one of the best ways to grow sod for turning under is to fertilize it heavily. You can see by his handling of the fields we have described that he practices what he preaches. He admits that it costs money, but he figures it is a good investment when he remembers how much less cow feed he has to buy.

### Less Erosion

Much of Ralph's farm slopes enough so that there is always danger of erosion. That is one reason why he likes grass and one reason he likes sod mixed in the top few inches when he seeds, because the cut-up sod helps to prevent erosion.

After the sod has been thoroughly disked, a soil fitter is used to make a seed bed. This, in effect, is a cultipacker with a springtooth harrow following that, which in turn is followed by another cultipacker. The outfit makes a very nice seed bed. The program which Ralph has evolved eliminates the growing of any cultivated crop and makes it possible to get an excellent seeding on sod; in fact, by the use of the rye he gets a large amount of pasture in the fall of the same year on which the hay is cut.

If any reader has tried out a similar practice—or a different one—in order to approach 100 per cent grass farming, we would be very glad to hear from him.—Hugh L. Cosline

## New York State Police to Fill 100 Vacancies

THERE is an immediate need for about 100 more New York State Troopers and an examination will be held on July 28 at Albany, Binghamton, Buffalo, Malone, Syracuse, White Plains, and perhaps at some other cities. The salary will range from \$1,600 to \$3,482 per year plus food, lodging and uniforms.

Because the chief responsibilities of members of the New York State Police are outside of incorporated villages, readers of AMERICAN AGRICULTURIST who have been brought up in small villages or on farms are likely to have the necessary qualifications. The following is taken directly from the notice of the examination dated June 13, 1951, and signed by Superintendent John A. Gaffney.

ALL APPLICANTS MUST POSSESS THE FOLLOWING REQUIREMENTS:

(1) United States citizen. (2) Between the ages of 21 and 40 years (candidates must have reached their 21st birthday and must not have passed their 40th birthday on the date of the written examination). (3) Sound constitution. (4) Not less than 5 feet 10 inches in height measured in bare feet. (5) Free from all physical defects. (6) Physically strong, active and well proportioned. (7) Weight in proportion to general build. (8) No disease of mouth or tongue. No dental caries, unless corrected; no missing incisor teeth. Reject if more than three teeth are missing, unless they could be replaced. (9) Satisfactory hearing. (10) Color perception and satisfactory eyesight (20/20) without glasses; no ocular disease. (11) Good moral character and habits. (12) Mental alertness and soundness of mind. (13) Minimum education, attainment of gradu-

ation from a senior high school or the equivalent thereof. (14) License to operate motor vehicles on the highways of this State. (15) No conviction for crime within this State or elsewhere.

Failure to meet these requirements at time of examination is disqualifying. No re-examination will be allowed.

PERSONS NOT POSSESSING THESE REQUIREMENTS SHOULD NOT FILE APPLICATIONS.

Application must be submitted on blanks provided by the Superintendent and may only be obtained in person or by mail from the Division of State Police, Capitol, Albany, N. Y. Applications must be filed with the Division of State Police, Capitol, Albany, N. Y. Applications filed by mail bearing a postmark later than midnight of July 12, 1951 may not be accepted. Applications filed in person in the office of the Division of State Police later than midnight of July 13, 1951 may not be accepted.

If you are interested in taking this examination and believe you have the necessary qualifications, the editors of AMERICAN AGRICULTURIST suggest that you write for an application. Any young man can be proud to wear a trooper's uniform.

— A. A. —

Farm pond sites should be planted and fenced if livestock are kept. A ten foot sod border surrounded by trees and shrubs makes an attractive setting. Where fencing is required, it may be possible to plant alongside it a hedge of multiflora rose which will, in time, become stockproof and take the place of the wire fence.

## THE MASSEY-HARRIS

# Spreader

pays off

- easier loading
- more uniform spreading
- longer life

Nobody need tell you what manure means to you in raising higher yielding crops. You know from experience! And if you've seen the Massey-Harris Spreader in action . . . or talked to a neighbor who has one, you know how quickly the Massey-Harris Spreader pays for itself in terms of richer soil and better crops.

Its low-slung body speeds up both mechanical and hand loading. The big flare-topped, acid-resistant box has grooved sides and bottom . . . holds 60 to 70 bushels . . . makes every trip count. Its screw-type jack hitch makes hook-ups simpler, safer.

You'll like the job the Massey-Harris does in the field, too. Its big rubber tires give you good traction . . . carry heavy loads over soft ground. The control levers are in an easy-to-reach position. You can throw

it in and out of gear and set the rate of feed without leaving your tractor seat. A sturdy slat apron moves the manure back to the beaters. Heavy teeth, staggered and riveted in the U-bar members of the cylinders do a thorough job of shredding, regardless of the toughness of the manure. Covered cylinder ends prevent wrapping. The two-piece auger distributor spreads a wide, even blanket, as light or heavy as you choose.

You can count on your Massey-Harris Spreader for years of dependable, low-cost service. It's built to take the punishment of fast, heavy hauling over rough, frozen fields. See your Massey-Harris dealer for details of the complete line of Massey-Harris spreaders, tractors, combines and equipment. For free catalog by mail, send coupon below.

**G.L.F. Pastry & Cake Flours**

Quality Pastry and G.L.F. Cake Flours are high quality, soft wheat flours milled by G.L.F. from low protein, soft white wheat grown by New York State farmers. We recommend using low protein pastry flour for pie crust, cakes, biscuits, pancakes, and other baked goods leavened with baking powder. For special cakes use G.L.F. Cake Flour.

Quality Pastry and G.L.F. Cake Flours produce baked goods with a tender crumb and are economical to use because of the reasonable price and the fact that they require a minimum of shortening.

# More Grass Silage On More Dairy Farms

By L. B. SKEFFINGTON

**T**HIS seems to be the year when almost every dairy farmer is making grass silage. Many who have ensiled grass in the past are putting up more of it this year. After a slow, cold start, growth in most sections has been prolific on improved pastures and meadows. Generally, upstate areas in mid-June experienced moderate to extremely heavy rainfall which had beneficial effect upon grass and planted crops.

In some cases, rain delayed finish of corn planting and caught some hay down, but on the other hand encouraged many farmers to keep right on cutting grass for the silo. In our own case at Gannett Farms we have not been able to keep ahead of the grass. We have two silos filled and have had to clip and rotate pastures often.

A couple of Ag teachers stopped in the other day, took a look at the pastures, and wanted to know how we keep alfalfa and ladino in them so long. We told them we supposed it was liberal use of potash and phosphate, and clipping. Every now and then we are asked about bloat. We never have had any, which I attribute to the advice of Ed Babcock several years ago.

"Keep part of the pasture clipped, if there is much ladino in it," he said. "Don't worry about the old dried grass. When the cows want it, they will go to it." We find this is so. Dean Davis of the California Agricultural College

told me that there was just one other thing to do: "Throw a few bales of old dried hay over the pasture fence."

\* \* \*

## "Farm Fair" This Year

Two years ago farm organizations in Seneca County did not like the way the county fair was being conducted. Too much emphasis upon horse racing and carnivals, they said. Being unable to do anything about it, they pulled out and staged the Seneca County Farmers and Homemakers Exposition. A good job was done, and it has been easy to see where farm interest centered.

This year, by invitation, the farm groups will be back in the county fair, provided that each farm organization has a representative on the fair board and that certain other conditions are met. Board members of both groups met together, and the net result seems to be that the county will have a bigger and better fair than at any time in recent years.

\* \* \*

## State Fat Stock Show

A New York State Fat Stock Show is scheduled for Caledonia on Nov. 2, with Jack Frederickson of Stanley as general chairman. Experience last year indicated that such a show has extensive possibilities, so plans are being started early. The emphasis this year will be on livestock marketing and the usefulness of marketing grades. There will be open classes and special classes for boys and girls.

\* \* \*

## Tomato Contracts Signed

After weeks of waiting, and with tomato growers becoming uneasy as planting time approached, the New York Canning Crops Growers Cooperative approved numerous contracts with processors. This was the first year of collective bargaining on behalf of tomato growers, following a sign-up of growers representing two-thirds of tomato acreage.

Original demand of the Co-op was for \$37 and \$27 per ton for Grades 1 and 2. Committees of growers negotiated contracts in several areas with various shadings of price, depending upon local conditions, hauling, etc. In some areas, contracts with processors were not approved. In these areas the Co-op plans to set up inspection stations to accommodate small processors and open-market buyers. In other words, it will stay in the tomato business to help grower-members without processing contracts to dispose of their crop.

All contracts approved with processors require the latter to deduct one and one-half per cent as dues for the Co-op. Growers seem to feel that they made substantial progress in their first year of collective bargaining, and there is some talk of extending the plan to other crops.

\* \* \*

## More Greenbacks

"Greenbacks from Green Acres" was my message when I was booked as the speaker at the Oneida County Green Acres field day. Last year I spoke in adjoining Herkimer County, so I was encouraged to think that my thoughts had some point. This year I tried to summarize in even briefer form. "For getting the most out of a Green Acres program," I suggested:

1. Use good land for pastures—not any old lot overgrown with brush and weeds. Good fields are easier to clip

and rotate.

2. Apply enough lime and fertilizer. If you use too little, you are cutting down on size of the crop.

3. Improve pastures and hayfields by planting recommended grasses and legumes. Nice green alfalfa is more appetizing to cows than some old timothy.

4. Plan your forage program as a whole, to improve the soil, to obtain maximum yields of feed, and to make best use of storage space in mow and silo.

5. Use modern equipment. Of course it is expensive, but you will be able to do more work with it.

6. This naturally leads up to the point that the operation should be large enough to justify the equipment. If you follow a grassland improvement program, you can expect to obtain larger yields that may help to pay for the equipment.

— A. A. —

## CHOCOLATE CAKE CONTEST WINNERS

**N**INE more Grangers are on their way to the finals in the big statewide Chocolate Cake Contest which AMERICAN AGRICULTURIST and the New

Miss Elizabeth R. Getty of Rock Tavern, N. Y., whose entry in the American Agriculturist-Grange Chocolate Cake Contest won over all others in the run-off contest held by the Orange-Rockland Pomona Grange. Miss Getty is a member of Little Britain Grange.

York State Grange are sponsoring jointly. Hundreds of dollars in cash, groceries, and household equipment will go to State winners next fall. Here are the lucky nine who are now in line for these prizes:

### POMONA WINNERS

COUNTY	GRANGE	WINNER
Cattaraugus	Mansfield	Mrs. George Causebrook
Cayuga	Auburn	Mrs. Edith Harris
Chautauqua	Kennedy	Miss Eunice Hill
Columbia	Canaan	Mrs. F. Otto Schmidt
Cortland	Albright	Mrs. Francis Parker
Essex	Whitonsburg	Miss Barbara Simpson
Oneida	Sherrill	Mrs. Owen Cunningham
Orange-Rockland	Little Britain	Miss Elizabeth Getty
Tioga	Spencer	Mrs. Nellie Gould

— A. A. —

## FOR GOOSE RAISERS

At the annual Poultrymen's Get-Together at Cornell on August 1 and 2, goose raisers will have a chance to be heard and to ask questions. In fact, "goose day" will be held on the previous day—July 31—under the direction of Professor Lou Hurd. Lou says that geese have been gaining in popularity, and other men in the poultry field—notably John Vandervoort—say that there is money to be made in raising geese.

As noted several times in AMERICAN AGRICULTURIST, there is special interest on the part of strawberry growers who are trying out geese to clean out the grass in strawberries.

At the Get-Together, the New York Poultry Council will meet at 4 p.m. on August 1. The New York Poultry Improvement Cooperative will meet at noon on August 2. Turkey growers will also get together informally on August 1.

## Tully, N. Y., Boy Wins A.A. Scholarship

**F**OR many years AMERICAN AGRICULTURIST has offered a scholarship each year to a Leadership Training Camp conducted by the American Youth Foundation. The scholarship includes the camp fee and traveling expenses to and from Camp Miniwanca, Michigan.

Each spring, applications are called

Paul Hallinan of R.D. 1, Tully, New York, winner of the American Agriculturist Scholarship to the Leadership Training School at Camp Miniwanca to be held in August.

for, and the winner is selected on the basis of his record in youth organizations and other community activities, with particular emphasis on evidences of leadership.

While there is plenty of fun at Camp Miniwanca, there is also a stiff two-weeks' training program which we believe will make any boy who attends a more valuable citizen in his community. The scholarship is given primarily because the staff of AMERICAN AGRICULTURIST believes it is a good investment in Northeastern Agriculture.

# Four-H Boys and Girls

## Demonstrate Poultry Practices

RECENTLY at the Syracuse Hotel in Syracuse, N. Y., sixteen 4-H Club members participated in the 1951 poultry demonstration project, prizes for which are provided by the Atlantic & Pacific Tea Company. Fifteen minutes was allowed for each demonstration but as several of the contestants had an unusual amount of equipment which had to be arranged, the contest lasted from 10 o'clock in the morning until after 4 o'clock in the afternoon.

Every demonstration was capably handled, as was only natural since each contestant was a county winner. In addition to the six contestants whose pictures are shown on this page, the following participated in the contest.

Nancy Thompson of Ticonderoga, Essex County, "Culling the Poultry Flock."

John Bowman, High Falls, Ulster County, "How to Raise Baby Chicks for the First 6 Weeks."

William S. Wilson, Roseboom, Otsego County, "Fowl Air."

Ronald Hadlock, Clinton, Oneida County, "Poultry House Ventilation."

Raymond Greenfield, Owasco, Cayuga County, "Let's Talk Turkey."

Bernard Dunkleberger, Auburn County, "Homemade Mechanical Picker."

James Heiman & Donald Scanlon, Akron, Erie County, "Picking Chicken with the Slack and Full Scald."

William Mapes, Spencerport, Monroe County, "Drawing and Trussing a Chicken."

Ronald Ward, Seneca Falls, Seneca County, "Culling the Poultry Flock."

Joan and George Hillman of Olean, Cattaraugus Co., N. Y., "The Customer Is Always Right."

The State Champions in former years were:

1950—Edward Corrin of Greene County, "Building a Range Waterer."

1949—Otto Koch of Sullivan County, "Rat Control."

1948—Fred Hopmeier of Schoenectady County, "Washing vs. Sandpaper and Steel Wool in Cleaning Eggs."

Robert Adler, E. Nassau, Rensselaer County, showed the audience "How to Make an Intermediate Feeder." To save time the various pieces had already been cut to dimension. Robert put them together, at the same time presenting a bill of materials and the final cost.

▲ Roy Curtiss III of Yaphank, Suffolk County, New York, giving his demonstration on "Control of Lice and Mites" which won him the right to represent New York at the meeting of the Northeastern Poultry Producers' Council at Harrisburg next fall. Roy explained in a very convincing manner the various chemicals and how each should be used.

▲ Janet Marquis, R. D. 4, Cortland, New York, representing Cayuga County, won an "excellent" rating for her demonstration on "Preparing a Brooder House for the Chickens." Step by step, she put down a litter, hooked up the brooder, put in feeders and water fountains, put a guard around the brooder to keep the chicks close to the source of heat, and finally she put some chicks under the brooder.

◀ Harold Haner of Buskirk, Rensselaer County, was rated "excellent" on his demonstration "Chicken Feed to Egg Quality." Some of his methods of presenting facts were original and convincing. For example, transference lighting from the rear showed the location of yolk and size of air cell of eggs of different quality.

Neil Empie of Johnston, Fulton County, was rated "good" on his demonstration of "Built-up Litter." He explained both its advantages and disadvantages. Built-up litter, he said, helps to keep a poultry house dry, and there seems to be some factor developed in the litter which actually increases the rate of growth. On the other hand, he said, there is some danger that disease might be spread by it.

Noah Prior, Jr. of Chaumont, Jefferson County, gave a very original demonstration on "Poultry Showmanship." After showing the proper method of putting a bird into a coop and removing it from the coop, he removed the coop from the bird and left the large White Rock male bird standing unrestrained on the table and regarding the audience with perfect poise.

## BABCOCK'S HEALTHY CHICKS

MAKE GREAT LAYERS

A. the 1950 Storr's Conn. Egg Laying Test our White Leghorns won first all breeds, with 3899 eggs and 4124.5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the all-time World's record for all breeds, all tests won in 1944-45.

WE HATCH THE YEAR ROUND  
White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks. We own two hatcheries with 600,000 egg capacity, three poultry farms, and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

## How "Black Markets" Operate

**O**UR present livestock and meat situation is laughable, if you can still laugh when our individual liberties are steadily being taken away from us. Right now our "boys" in Washington are like the little boy who got his rear end slapped pink and then pouted around blaming everyone for the condition he was in, forgetting that he was responsible for the "window" being broken.

Grown men are now holding hearings, investigations and what have you, in Washington, to find out who is to blame for the present meat shortage. Actually they are really trying to blame the farmer, the livestock raiser, the slaughterer, and even the fellow who eats beef, for the sad plight they are now in regarding the present unfair, unjustified and unwanted rollbacks and controls. If you will get busy and write to your congressman, controls can be eliminated.

Meat is disappearing. It did before under controls, so there is nothing new about that. The funny thing, or rather the discouraging thing, is that all the honest men are spending their time and money to save their businesses and protect the liberties of all of us while black market operators are staying at home making "hay."

Many loads of cattle have gone through the Buffalo Stockyards in the last week with new names attached,

or with names we have not seen since the last black market days when we were under controls. Our imports from Canada have increased 35% in two weeks. Our legal packers are rapidly being forced out of business, for they cannot compete and obey the laws while black market operators are doing business under no law at all.

How can this be done is a fair question. Perhaps the best answer is that it is being done exactly the same way it was done under rationing. The black market boys' books were always legally correct. O.P.A. made many "crack-downs," just as O.P.S. say they will, but they seem to get nowhere.

For example: A retailer goes out to buy beef and finds that the legal packer has none, for he cannot buy it alive at the price O.P.S. has set. He therefore must go to a black market operator or go out of business. Then this is what happens:

Retailer: "Joe, I have to have a couple of sides of beef."

Joe: "All right, I have it but it costs quite a lot."

Retailer: "How much?"

Joe: "Oh—just the O.P.S. legal price."

Retailer: "All right, send it out."

Joe: "There is a little difficulty about getting it out to you. I have to have \$100 delivery charge in cash and your signature on a receipt for the beef which does not show this delivery charge."

Or, it is being done this way: "Our scales are accurate, yours are not, so you must accept this beef at our weights."

Retailer: "Then if you send me 70 pounds of beef and bill me for 100 pounds at the legal price, I must sign a receipt for 100 pounds or not get the beef?"

Joe: "That's right."

Then Joe sells the other 30 pounds from each hundred pounds he has shown on his books for cash. Now his books are O.K. and he has met all quotas, yields, price compliances, and every other regulation that Mike Di-Salle says makes black markets impossible and, furthermore, a "crack-down" on Joe is useless.

Obviously, then, Joe can go out and pay 33 cents a pound for a live bull, as he is now doing, when the government says he cannot pay over 28 cents. Yet the honest, legal packer, big or little, cannot do this under threat of going to jail. The vicious cycle goes on and on, getting worse and worse as long as government controls are in force—and the "poor" public pays all the bills.

Every day we hear from bureaucrats: "What is going to become of all the cattle? They have to come to market some day." This shows pure ignorance of the livestock industry, yet it sounds reasonable enough. No man in his right mind will sell his bull for 28 cents when a government market quotation is 33 cents, and just so long as some "Joe" is proving to himself that the public is willing and able to pay him a profit at 33 cents a pound he will furnish it.

If he does not dare eventually to buy it at a public open market, he simply goes into the country and gets it before it goes to market. But the sad part is that the producer who got 33 cents for his bull cannot depend upon "Joe" or upon what the bureaucrats may do. He, therefore, with no confidence, produces no more bulls and then we have rationing — red stamps, butcher-shop lines, and a true shortage, just as we had before — until controls were removed and confidence restored in our tried-and-true system of supply and demand price-making.

The whole meat picture is as simple as that, but it is only a small part of what is happening to this "Grand Old Country of Ours." Socialistic and communistic forces, intentionally or through dumbness, are lying to our people

about the beneficent things they can do if we give them even more power, and tighter power, and, unfortunately, they are getting away with it.

Russia has gone all the way in the very government power steps that we are taking. Wouldn't you think that would be lesson enough?

— A.A. —

## THE JUNE EARLVILLE SALE

**O**NE hundred eighty-three head of Registered Holstein cattle were sold in the June 12-13 sale at Earlville, N. Y., for \$122,500, resulting in an average of \$660 for each animal. This is the highest volume ever obtained in this series established over 28 years ago under the management of R. Austin Backus, Mexico, N. Y.

Ninety-four breeders from 7 states sold their choice Registered Holsteins in this sale to 100 buyers from Mass., Penna., New Jersey, Maryland, Missouri, and 26 counties of New York State. The Super offering which was sold the first day was selected by Orson D. Smith, Canastota, N. Y., and consisted of 67 head that averaged \$985, including 23 that sold from \$1,000 to \$1,900.

There were three animals selling for \$1,900 apiece, including a 3-months-old bull calf consigned by Daniel Mayne, Fairport, N. Y., and purchased by Archie Meek, E. D. Russ, and Eddy Wade, Bainbridge, N. Y. A second-calf heifer consigned by Lawrence W. Roe, Madison, N. Y., sold for \$1,900 to Forsgate Farms, Jamesburg, N. J.; and the other \$1,900 animal was a first-calf heifer due to freshen in August, consigned by John Roebuck, Walden, N. Y., and purchased by Robert Wehle, Scottsville, N. Y.

The largest buyer, Hassan's Farm, Germantown, Md., purchased 32 head for which they paid \$23,280, the largest individual purchase ever made by any one party at any one of these sales.

Nearly 1,000 people were present at the sale each day, coming from many states and Canada. These Earlville sales are conducted monthly under the management of R. Austin Backus, Mexico, N. Y. The next sale will be held on Thursday, July 5.

## WHAT ABOUT BIRDSFOOT TREFOIL?

(Continued from Page 8)

safe. We have had too little experience with European seed to recommend it.

**Care of Seeding the First Year.** Keeps weeds clipped. If oats is used, graze when 8 to 10 inches high. Grazing of trefoil the first year is doubtful. Don't use manure the first year.

**How Long Will a Seeding Last?** Many stands over 30 years old are known. Established seedings seem perpetual.

**On What Kinds of Soils Should Trefoil Be Planted?** In nature trefoil is one of the most widely spread plants known. Probably that is because of its ability to feed from subsoils and survive considerable abuse in top soils, such as moisture variations.

Managed as outlined herein we are confident it can be grown over a wide variety of soils.

**How Should a Farmer Start?** Tillable pasture offers a good starting place. Once established, an almost permanent legume stand is obtained. By seeding 10 acres a year a farmer could have 100 acres established at the end of 10 years. This is not generally true with most legumes which last on the average, 3 to 5 years.

Some of the poorer land on the farm can be used first, since taking it out of production the first year to get the seeding established will be felt less

than if a more productive area is used. Often the subsoil is as good as on the better managed areas.

**General.** Legume acreage can be greatly increased, and economically too, by considering birdsfoot trefoil, and the management practices discussed here.

— A.A. —

## THE LAMB THAT STAYS HOME

Any farm boy knows that if one sheep leaves the pasture, the rest of the flock will follow. When your lambs are loaded for market, however, one or two should stay behind. These lambs can supply tender, nutritious, tasty meat for the family table. Which one should you keep? The motto, "Eat the best and sell the rest," is a good one to follow. The flock can supply more than just income from wool and lambs sold. It can supply you directly with fresh meat and add variety to the diet. Don't overlook this additional source of return from your farm flock.

—George H. Wellington

Old Doc TRESCOTT Says—

"TAKE IT EASY,

and you'll live longer! — and taking it easy is just what you can do when you install TRESCOTT Potato Handling equipment.

"Just think of it! You simply dump the potatoes right from the field crate or storage bin into one end of a TreScott Potato Machine.

Dirt is eliminated, No. 2 and No. 3 sizes are graded out, sprouts are removed and dirt brushed off the No. 1 grade before they go over the roller sorting table into the 2-way bagger for 10 lb., 15 lb., 50 lb., or 100 lb. containers, etc. All you do is dump 'em and watch!"

Several sizes of elevators, sizers, brushers, roller sorting tables, washers, waxers and baggers—all field-and-use-tested—are available. Interchangeable for a wide range of combinations and uses.

Write for circular giving full information — and tell us your requirements.

# Let Your Children MAKE Things

RECENTLY I aired my grandmother's quilt she made when sixteen. The tulips still show bright red against the finely quilted white background, and the green leaves are still there in graceful curves. Every young girl in those days made a quilt and it was not only a fine way to acquire bedding for the hope chest, but something else our forefathers and mothers didn't know much about (at least they didn't call it what we do today). It was creative activity—a form of art.

Coverlets were woven, too, and many precious handmade things found their way, along with the early settlers, through the forests and across the plains. Handmade chests and fine embroideries, threaded with dreams from the hearts of the young and gay, were the last thing to be parted with when the Indians swooped down and chased them from home and fireside.

All of this goes to prove that in the very roughest of pioneer times people couldn't live without art. It cropped out here and there even when strict religious creeds seemed to forbid it. Hand-carved butter and pudding molds, hand-painted tinware, and decorated stoneware graced their pantry shelves.

Finely painted clocks and pianos, portraits of young and old, and pictures of homely scenes are among our earliest collections of Americana. Many were done by individuals who whiled away the long winter evenings with paint brush, needle or knife. The reason this golden thread of activity can be traced down the very path of civilization is because art is so necessary to the health and happiness of mankind. Not just the enjoyment of what is produced, but the creative activity itself. Our machine age has very nearly stolen it from us. Radio and television, fine as they are, leave nothing for the individual to do. The camera makes the picture, the movies entertain us for a small admission, and we sit and watch. All of this is wonderful and to the good, but the pleasure of *making* is not in it.

Not all of us respond to the same kind of creative activity or art. Some like to sing, others to dance. These are both cousins to arts and crafts. And the variations are so many it would be impossible to list them. Sewing, weaving, basket making, carving, modeling, painting, cutting and pasting, and woodworking are some of them. There are combinations of singing, talking, writing and dancing with designing and painting, such as amateur play production, pageants, etc. But the do-it-yourself pleasure is the same.

Some persons have a taste for or respond more readily to one kind of creative activity, and others to something else. That is why it is so important to give a young child a taste of all of them so that he may find himself. Children inherently like to build with blocks, make mud pies, play with dolls, play house, and draw and paint. Mother likes to arrange neat rows of bright colored fruit jars, cut flowers in the top crust of her pies, choose Susie's hair ribbons and select the colors for her kitchen curtains. All of this is art.

Johnny might be able to buy a very nice boat at the dime-to-dollar store, but the pleasure it will give him is not

—Photo by C. Hadley Smith

**E**IGHT-YEAR-OLD David Wagner and his four-year-old brother Robbie of 314 Cornell Street, Ithaca, N. Y., are making the pinwheel boats described in Joseph Leeming's book called "Toy Boats to Make at Home." Robbie is painting his red because, he says, "Wed is my favorite color." David, who is keeping a weather eye on little brother, is sawing the slit in the stern in which a piece of cardboard or tongue depressor will be inserted for a rudder.

The boats are made from a rectangle of soft pine  $2\frac{3}{4}$ "x8" and  $\frac{3}{8}$ " thick. A carpenter cut off the corners, and some older boys whittled the curved bow. A center line drawn down the length of the wood block helps to line up the point with the rudder and also helps locate the masts made of 4" pieces of  $\frac{1}{4}$ " doweling. The dowels are 4" apart, the first one  $1\frac{1}{2}$ " from the stern end of the boat. Holes were drilled in the hull with a Yankee drill, and the masts whittled down so that they fit tight when driven in with a hammer.

The ends of the masts were dipped in casein glue before placing, to make them stick. A coat of shellac preceded the enamel paint Bobbie is applying. David has one shellacked and drying on the two tin cans seen in the picture.

The pinwheels are made from three-inch squares of paper, and these boys made theirs double, one sheet white and the other colored because they are prettier that way. Diagonal lines are drawn from corner to corner, and a circle drawn around a big button at the intersection. This circle is the deadline for scissors when cutting the diagonals. Every other corner is then turned in, and a big pin run through them and through the center of the wheel. A tip on driving a pin in a dowel is to chip the dowel first with a knife. A flat surface is easier to pierce than a round one, and if it is done before the boat is painted and a pin hole made, it is all ready for the pinwheel "sails" when the paint is dry.

to be compared to that which he may derive from whittling out a hull, stringing up a rubber band motor with a hand-carved propeller, and launching his own handmade craft. It is the *making* of it that gives such deep satisfaction. And making it *the way you want to make it*. Imagine your neighbor telling you which way to plant your flower beds, or how high or low to clip your hedges! You want your own, and the right to make it the way you please. And so does a child.

Give him a variety of materials and suggest ideas—but don't dictate. And be satisfied with the result no matter

how crude. In less than twelve-year-olds, it is the trying, the making that counts, not the product. Even a teenager should be allowed to make choices, and feel his way. Then what he or she makes is their very own.

The love of beauty is inherent in every one of us and a pre-school child is a natural designer, with no inhibitions unless we put them there with too much criticism. Children under ten will draw, paint, build, cut and paste with wonderful freedom and satisfaction from what they do if given material, a place to work, and a little encouragement. A wooden easel for the youngster

who likes to splash paint can be placed in the yard on a summer day or stood over a piece of oilcloth or layers of newspaper indoors in bad weather.

Simple, natural materials lie on every hand. Keep an eye open for new ideas. Save paper, all kinds, and paper bags. Dry beans, peas, and macaroni make excellent design material, as also do buttons and odd bits of hardware. A half cup of each of two or three of these will keep a youngster busy for an hour and develop his ability to choose, combine, and arrange. Let him tell you what he makes. Today it will be a picture, tomorrow a design. One day he outlines a horse with beans, or arranges them to make a star. The next, the peas are dumped on a sheet of paper to make the leafy top of a tree in his picture.

Mud pies are wonderful. So are leaves. Children like to mold wet sand in small cups or pans. When I was a child, somebody gave me a set of pie tins, doll-sized — about three inches across. I had a box of sand, and many a summer afternoon was spent keeping store. I made cakes and pies, meat loaves and endless products with the wet sand, inverted on an old wood plank and decorated with stones, flowerets and seeds. Leaves became fruits, vegetables, and wrapping paper.

The dead-end of a cross-street near our home was "filled" with cinders from a glass factory, and among the clinkers were great chunks of colored

By

DOROTHY WELTY THOMAS

glass that looked like jade, sapphires, emeralds. Two other little girls and I built fairy palaces of these, lined them with dandelion gossamer, and housed our paper dolls in them. A footnote on this is that one of the little girls grew up and took claim on a homestead in Montana, another became a missionary, and the third a teacher. Each child wanted to *make* something.

If Johnny makes you a dining room table on the floor of the barn from some old rough boards and tells you seriously he has a secret and it is going to be something beautiful—don't laugh. He can pass from the imaginary to reality and back again two or three times without damage to his ego, but he can't stand it to be laughed at.

Let them cut, paint, sew, dig, arrange and cook to their heart's content. Someday they will make great things and you will be glad you endured the mess.

(Patterns on red and white construction paper for pinwheels for boat, and also for a large double 8-point, red and white pinwheel, may be had by writing to Mrs. Dorothy Welty Thomas, AMERICAN AGRICULTURIST, Box 367, Ithaca, N. Y. Please enclose 5 cents for mailing.)

# Cherries

## CHERRY AND GOOSEBERRY JAM

1 quart gooseberries  
1 quart pitted sour cherries  
5½ cups sugar

Wash the gooseberries and remove the stem and blossom ends. Place all ingredients in a kettle. Heat slowly, stirring constantly until the sugar is dissolved. Bring the mixture to a boil and boil rapidly, stirring occasionally, until it is thick. Remove the jam from the heat, skim if necessary, and pour into hot jars. Seal. Yield: three pints.

## CANNED CHERRIES

Cherries keep their shape better if the pits are not removed, and with some varieties the flavor of the pit is desirable. Sweet cherries are not usually pitted. Use ripe, freshly picked cherries. Wash, stem and drain them. Pack them tightly into clean, hot jars, and cover them with a boiling sirup. The sirup may be medium (3 cups of sugar to 4 cups of water) or thick (4 cups of sugar to 4 cups of water), as desired. Seal the jar according to the type of jar used. Process in a boiling water bath; pints for 20 minutes, quarts for 25 minutes.

## CHERRY MERINGUE BREAD PUDDING

2 cups hot milk  
1 cup dry, ¼-inch bread cubes  
¾ cup sugar  
2 tablespoons butter  
1½ cups cherries, drained  
3 eggs, separated  
6 tablespoons sugar

Pour the hot milk over the bread cubes; add the sugar and butter and let stand 5 minutes. Add the cherries and slightly beaten egg yolks. Pour into a greased 2-quart baking dish and

bake in a slow oven, 300° F., for 50 minutes, or until a knife comes out clean. Make a meringue of the egg whites and remaining sugar, and spread over the baked pudding. Return to the oven and bake until brown, about 15 minutes. Serve warm. Yield: 8 servings.

## CHERRY PIE

3 cups cherries, drained  
¼ cup cherry juice  
¾ cup sugar  
¼ cup flour  
Pastry for a 2-crust pie

Heat the cherries and juice. Mix the sugar and flour; add gradually to the cherries. Cook until thick, stirring constantly. Pour the mixture into a pastry lined pie pan. Cover with a top crust, seal the upper and lower crusts together well, cut or prick the top. Bake in a very hot oven, 450° F., for 15 minutes, then reduce the temperature to 350° F., and bake for 20 minutes longer, or until the cherries are tender and the crust is brown. Yield: 1 9-inch pie.

—Anna Rogers Willman

## Kidney Slow-Down May Bring Restless Nights

When kidney function slows down, many folks complain of nagging backache, headaches, dizziness and loss of pep and energy. Don't suffer restless nights with these discomforts if reduced kidney function is getting you down—due to such common causes as stress and strain, over-exertion or exposure to cold. Minor bladder irritations due to cold or wrong diet may cause getting up nights or frequent passages.

Don't neglect your kidneys if these conditions bother you. Try Doan's Pills—a mild diuretic. Used successfully by millions for over 50 years. It's amazing how many times Doan's give happy relief from these discomforts—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

## WHAT'S GONE BEFORE

Immediately after his marriage to Ann Clinton, Mark Wilson leaves to join Lincoln's volunteers. His brother, Charlie, and his father, George Wilson, follow him into the Army; also Ann's father, Fred Clinton. Mark returns to the Army after a leave and then news comes to Jenksville that he has been killed at the Battle of Fredericksburg. Ann's grief seems more than she can bear. Meanwhile, Charlie Wilson is busy with the cavalry following Lee back to the North. He takes part in the Battle of Gettysburg, from which both he and his father escape unhurt.

## CHAPTER XXII

PERHAPS because Nancy had grown more used to the war, or because she was driven so hard by the necessity of keeping her family fed and clothed, the summer and fall of 1863 somehow got by without her worrying as much as she had in the first years of the war. When she realized this, she thought of Mark and wondered if she were getting hardened to grief. "Maybe there's a limit," she thought, "to what a woman can stand. After that, nothing much matters."

It helped that Tom was a little older and able to take more of the responsibility for the outdoor work. Enoch Payne was just as helpful as ever, although it was getting more and more difficult for Nancy to get him to accept any pay for his services.

The crops weren't so good. Nancy knew that it doesn't take long for a farm to go backwards when the hand of the master is absent. But still the family had managed to get in some of the most necessary crops, and the two cows had calved. They were raising a nice heifer, and she planned to butcher the bull calf in the fall for meat for the family.

Hardest of all for Nancy to take was Ann's behavior. She no longer seemed to care about anything. Once in a while she got the mail and brought a letter from George or Charles home to Nancy. Sometimes she would stay to listen while Nancy read the letter aloud, but often as not before Nancy was halfway through it, she would slip quietly out of the door and they wouldn't see her again for some time.

This happened when she brought Nancy a letter from George in which he described, in some detail the Battle of Gettysburg. When Nancy got the letter, in spite of her horror as she read of the awful carnage, she was happy that her husband and Charlie had come through safely. She was filled with a feeling of optimism as a result of the victory of the Union forces. After all, Lee had failed in his great invasion, the enthusiasm of the North had been revived, and maybe this was the beginning of the end.

But this time, also, before Nancy had finished reading the letter, Ann turned from her and dashed away. What did one battle more or less mean to her? Her husband was dead!

To Ann it seemed that the farm this year was just about in the same "don't-care" mood that she was. She had managed to plant the crops, but they had not done well, not only because of the poor season but because she had not planted or cared for them with the same care and enthusiasm that she had at first when the men had left. Even her mother's constant worrying and

nagging about the farm and the likelihood of their losing it made little impression. When she thought at all, she just felt numb. Why struggle and worry? Nothing could happen worse than what had happened.

Even when her mother began to hint that maybe the answer to their problem, the way to get a little security, was for Ann to be kinder to Henry Bain, Ann didn't argue. Maybe that was the way to save the farm, she thought. What difference did it make now?

As for Henry, he played his cards well. He was a frequent caller, always kind and thoughtful, and careful not to be too personal or otherwise to annoy Ann in any way. Occasionally he took her for a ride, and she went in the same apathetic mood in which she did everything else, and as much to please her mother and get a little peace at home as for any other reason.

Gradually, almost without realizing it, Ann began to depend on Henry's kindness. She no longer felt close to Nancy, because Nancy and all of her old friends reminded her so poignantly of her grief that she preferred to avoid them. Two or three times in her despair she thought of going to Pastor Belden for help. But there again she felt that he couldn't help, because she would be thinking all the time it was he who had married her to Mark.

Quick to note that Ann seemed to be a little easier, a little more like herself when Henry was there, her mother stepped up her sly campaign to break down Ann's resistance. She even let

Henry know that she quite approved of his attentions to her daughter.

On one of Ann's rides with Henry in the middle of October, he took her to the top of a ridge. After tying his horse, they walked a short distance from the road and stopped to admire the view, and the fall coloring of the maples and the other hardwoods. The sun was warm. As she listened to Henry's talk and looked across the countryside blazing with color, heard the drowsy undertone of insect life, Ann felt more relaxed and more at peace than she had been in a long, long time. She sat down, and Henry sank down beside her. Taking her hand, he said, tenderly:

"Ann, my dear, I just can't bear to see you and your mother so worried about security, about your farm. This afternoon I brought you up here not only to see these beautiful woods, but to tell you that, look in any direction you wish, all these woods and lands belong to me. I know that you don't love me, but I love you. I have for a long, long time. Mark is gone. Marry me. Maybe in time you'll learn to love me. In the meantime, I'm sure I can make things easy for you, for your mother, and for your father when he comes back."

As he talked Ann withdrew her hand and drew a little apart from him. Inside her a little voice seemed to be saying: "The devil taketh him up into an exceedingly high mountain and sheweth him all the kingdoms of the world and the glory of them. And sayeth unto him, 'All these things will I give you if thou wilt fall down and worship me.'"

Then, ashamed of such an unkind thought, Ann forgot all the things to Henry's discredit, remembering only how kind he had been to her and her mother for week after week. She drew closer to him again, reached for his hand, and said:

"Henry, don't think I am ungrateful. I have come to depend on you more and more, but it's true that I don't love you. I never can love another man."

"Never is a long time," he interrupted.

"Maybe so, but that will be true for me."

Then, turning to look directly into his eyes, she continued:

"Henry, I just don't care what happens to me. But I do care about Mother, and about Dad, if he comes back. If you are sure you know just how I feel, I will marry you and try to be a good wife to you."

Exultantly he jumped to his feet, pulling her up with him, and took her in his arms, pressing his mouth to hers. But even in his ardor he felt the coldness of the lips that met his, the lack of response. After standing it as long as she could, Ann stepped back, cold shivers running up and down her spine. She felt more alive than she had since the news of Mark's death had come, not in response to Henry's caresses, but because of a complete physical aversion to them. Then, her indifference returning she thought:

"I can stand even that. Maybe I'll get used to it. Anyway, Mother'll be pleased."

Sensing her mood, Henry took her hand and led her back to the buggy. That night Ann told her mother. Mrs. Clinton couldn't restrain her satisfaction:

"Oh, I'm so glad," she said. "Now we'll all be taken care of."

Then she made a mistake:

"Even if Mark had come back—" she began, but got no further, for her daughter jumped to her feet and, in a low voice, said: "Never say a thing like that to me again!" Brutally frank, she continued:

"You might as well know that I don't love Henry Bain. I'll never love him. I'm marrying him for your sake and to save this damned farm—and you know it!"

Almost frightened by Ann's vehemence, her mother was wise enough to hold her peace. All she said was:

"When?"

"Tomorrow," snapped Ann. "The sooner the better. Let's get it over with. Another thing," she continued, "I want no fuss. You're not to tell anyone until we get back. We're going to Ithaca and find a Justice of the Peace."

Mrs. Clinton said no more. On the surface she was quiet and a little subdued; inwardly she was jubilant.

The next day Ann stood in Ithaca with Henry Bain before a stranger in his shirt sleeves and was married to him. Only the Justice's wife and another stranger were present for witnesses. As she repeated the vows, they seemed to choke her, and she had a desperate and fearful longing to turn and run away from there, away from everybody.

They ate supper that day in Ithaca, and then took a room in the local hotel. Henry excused himself and was gone for a long time. Ann was glad to be alone, dreading his return, but couldn't help thinking that his absence was strange. Now she remembered Enoch Payne's story of his experiences in Ithaca with the Copperheads and the gossip that she had almost forgotten that Henry Bain—her husband—had for a long time now made frequent trips to Ithaca and was a leader of the Copperheads.

Waiting and dreading his return, Ann's feeling of indifference and apathy gave way to wonder and fear that she had made a terrible mistake. Had she in trying to settle some of her problems not added the worst one of all? Then she shrugged her shoulders, lapsed back into indifference, and muttered aloud:

"What do I care? What's done is done. Nothing, not even this, matters. Nothing can ever really touch me again."

Sinking into the old threadbare hotel chair, worn by the guests of a quarter century, Ann closed her eyes and waited with neither anticipation nor fear for her husband's return.

## NO DRUMS

(Continued from Opposite Page)

in Ann's marriage to Henry, the Clinton farm now took on a new life and activity. The crops were harvested. New stock and enough hay to feed them were moved from one of Henry Bain's other farms to the Clinton barns. Henry, after moving to the Clinton home, had immediately taken over the full management of the farm along with his many other activities.

Since her marriage, Ann had gotten completely out of touch with Nancy and the other Wilsons and their activities. In fact, she no longer went to the post office or store, and avoided former friends and neighbors, quick to sense their coldness and antagonism.

Nancy had been profoundly shocked when she heard that Ann had married Henry Bain, the most hated man in the entire community. What Nancy didn't realize at first was that Ann had been so stunned by Mark's death and the whole impact of the war, plus her mother's constant nagging and worrying about the farm, that she had married Henry Bain as an escape. When Nancy's insight finally made her reach this conclusion, she sighed deeply, knowing full well that it was no escape, and that Ann, still young, would before too long recover from the shock she had had, and would then realize that in marrying Bain she had made a dreadful mistake that would eventually bring her a greater sorrow.

When, after a mild question or two as to where he had been he had told Ann it was none of her business where he went, she shrugged it off, as she did everything else, and told herself that she didn't want to know. What he did was a matter of utter indifference to her. What she couldn't ignore, however, was his attitude around home. Here his true nature was beginning to show itself. Ann could stand Henry's arrogant bossing of everything about the farm outdoors. After all, she was glad to be rid of that responsibility. What she resented most was his changed attitude toward her mother. He no longer made any attempt to be considerate, or even polite to her. Often when Mrs. Clinton was speaking, he would interrupt her, and once he had told her to stop talking so much. Ann couldn't help thinking that she had married Henry mainly to give her mother some peace and security and to make it easier for her, and now she began to wonder what would happen when her Dad got home.

Harder still to take was Henry's attitude toward herself. It was easy enough to think that nothing mattered, that she had known when she married him that she didn't love him and so what could she expect, but it rankled just the same. He had been so kind before they were married and now he was neither kind nor considerate. Maybe she was to blame. In her most honest moments, she admitted that she was no true wife to Henry. Fight herself as she constantly did, tell herself that he had certain rights, she could not help her whole being rebelling against their relationship, nor prevent the cold chills from chasing up and down her spine every time Henry laid even a possessive finger on her.

As they got to know each other better in the intimacy of home and of marriage, she grew more and more annoyed by little habits and idiosyncracies which, had she loved him, would have gone unnoticed or been completely discounted. She began to do considerable worrying as to whether her forced toleration wasn't rapidly curdling into an intense hatred.

Henry, too, wasn't long in realizing his wife's coldness, but in his complete egotism he felt sure that what she or any woman needed was to be made to realize that a husband was the boss, and that the woman's attempts to reason why should never be permitted.

Sure, Ann had told him when she consented to marry him that she didn't love him. But it mattered not at all how she felt. It was a man's feelings and needs that mattered, he said, to himself. Any man, and particularly a man of his ability and means needed a wife, and that was that. In time he would drive the foolishness out of her or he would know the reason why. As for the mother, she was going to be put in her place, too. No more of that whining and complaining around him.

Ann had never forgotten the homely, sad, but striking face of Abraham Lincoln in the picture that she and Mark had stood before in the Owego Hotel. Nor had she forgotten the kindness in that face, and particularly in those deepset eyes under the shaggy brows when she and Nancy sat before the President of the United States in the White House and pleaded for Mark's life. Those memories, together with the patriotism inherent in every good American, were now coming back to plague Ann's thoughts as she began to realize that the man to whom she was married was almost if not quite a traitor, opposed to everything for which Mark Wilson and so many other boys had fought and died, and for which so many more of her friends were fighting.

As Ann began to think about the war again, she felt more and more unhappy and helpless to do anything. She had made her choice and her bed; now she had to abide by her decision. But she was awake at last to the situation she had created. In marrying Henry Bain she realized that she had made a bad situation even worse for her mother and father, and most of all for herself.

She finally reached the conclusion that being the wife of Henry Bain—or of any other man—did not mean that she was his slave. He could possess her body, but never her soul, nor her love and affection, until he had earned that right. It was hopeless for her to try to influence Henry's actions, especially his anti-Union activities, but she did have the right to assert her own attitude and loyalty to the Union.

The differences between Ann and Henry finally flared into the open when Ann announced her intention of taking a more active part with the other women of the neighborhood in making and sending various articles, chiefly clothing, to the United States Sanitary Commission, for the comfort of the Union soldiers. She returned home from Jenkstown one night about supper time to find Henry waiting for her in a towering rage:

"Where've you been?" he demanded.

Turning in the center of the kitchen floor to face him, she answered:

"You told me once, Henry Bain, when I asked you where you had been that it was none of my business. I don't think that's the way a husband and wife should be, so I'll tell you where I have been. I spent the afternoon—as I intend to spend many other days—making things for the Union soldiers."

He started to shout at her, but was so enraged that his voice cracked, and he had to start again:

"I don't want to hear of your doing it again, do you hear? No wife of mine will have any part in prolonging this war."

He was trembling all over. Ann spoke quietly:

"Henry, if you want me to continue to be your wife, we might just as well understand each other right now. No soldier on the battlefield, no person back here at home, can feel more intensely about our winning the war than I do. I can't do much, but whatever I can do I shall. And you can't stop me!"

She was standing close to him, gazing directly at him with white face and blazing eyes. He stood for a moment staring at her almost in awe, and then turned and without a word went out of the house.

(To be continued)

## Tune Out Summer Static

## Tune In More Programs

with ZENITH'S New  
Super-Sensitive FM

Yes! More stations, more programs—day or night, summer or winter, even during the worst storms. Zenith's new Super-sensitive FM brings them to you *all* beautifully sharp and clear, virtually free from annoying static and fading. You enjoy news, sports, music, weather and market reports when and where AM and many FM sets just won't work.

Exclusive, superior Zenith Tuning Circuits prevent station drifting, fading. Zenith quality-built speakers assure you FM tone at its best. Built-in Zenith® FM antenna ends the need for outside aerial in primary signal areas.

### New Zenith "Super-Medallion" FM-AM Table Radio

A miracle of power, tone, smart styling! Super-sensitive FM *plus* famous Long Distance® AM reception. New giant dial for easy tuning. Handsome Walnut plastic cabinet.

# The H. E. Babcock Memorial

A lot of us remember things learned from Ed Babcock. He had a knack for teaching seldom equaled. Here he was spelling out to farm and business leaders the importance to the nation of the optimum diet. His concept of the optimum diet as one liberally supplied with meat, eggs, milk and its products has been generally accepted.

By T. E. Milliman

horses, the Angus, the sheep and hot-house lambs, the pastures and his ability to make them exciting subjects, the dairying, and the farm machines. His writing stimulated a lot of thinking and action for better adapted farm machinery for the Northeast. He hastened the mounting of farm equipment on rubber.

Some of us will remember the farm characters—"old 68," the ewe that would not be regimented nor have her production controlled. She had twins. Who was to say her nay! Then there was Taupey, the bucking pony—an indomitable spirit—Hitler the hog—and many others. Perhaps at the top of the list in interest was Tony—the unbeautiful, strong, quick, intelligent, polo pony who in his 11th year dashed out of the barn one day, and not seeing too well, failed to miss the corner of an adjacent building, hit his head and was gone. The incident had meaning for those who are reconciled to seeing a fine career cut off quickly before any deterioration sets in, and Ed Babcock liked that philosophy. The way Tony went was much to be preferred to becoming old, and blind, and helpless and crippled, he thought.

So he himself left us in 1950, still high in effec-

saw a better life and better business for all Americans, city and country alike. The Babcock Memorial Professorship has taken form as a means of perpetuating that vision and bringing it to a reality. All farmers, and especially Northeastern farmers, have a stake in it.

## A Living Memorial

There was much stirring among Ed's friends and admirers in agriculture, industry, and the professions to find a good way of honoring his memory and at the same time to set up means for carrying out his lifetime objectives. After numerous meetings to which men came from all over the country, The H. E. Babcock Memorial Professorship was gradually evolved and was described as the Chair of Food Economics, with a goal of \$500,000 for financing the Professorship and related activities.

The idea was offered to Cornell University, which Ed dearly loved and in whose behalf he had labored mightily. The Trustees of that great institution readily approved and accepted the offer. They were all friends of Ed Babcock and understood well the objective of the Memorial.

A committee was formed and they with others have now succeeded in raising \$315,000 toward the goal of a half-million. Most of the contributions have so far come from non-farmers who admired Ed and knew him to be on the right track. Now it is our turn as farmers to honor this friend by

**W**E, the readers of "Kernels, Screenings & Chaff," had ringside seats with Ed Babcock for 18 years of important agricultural history in this country.

During this period, ending in July 1950, I don't believe I missed a single issue of KS&C, and I know a lot of readers would say the same. Many of us knew Ed Babcock and worked with him prior to 1932, but from that date on we had, in addition, the enjoyable association with him in the "Kernels" page in A.A. We sometimes wrote back our differences of opinion, and occasionally got quoted when we least expected it.

The Babcock page was a farm forum and an example of fine agricultural journalism. It had variety and warmth, it rang true, it was extremely instructive at times, and at other times had entertaining features. We never knew just what to expect and therefore always stole a look at "the page" as soon as it came in.

The pictures here will recall but a few of the ideas Ed wrote of. We all remember following the chopped dry hay experience, the grass silage processes and results, the light and heavy

This picture of Ed Babcock and Ed Eastman has much significance. The two Eds were great friends and co-workers practically from the start of their careers. Here in front of grass-fed heifers they could have had no better background to illustrate animal agriculture as a means to better diet for all our people.

When Ed put packages of meat into the Babcock home freezer to freeze or removed them for use on their table, he was pioneering. He dreamed up and had built the first home freezer ever known. The idea caught on rapidly and almost at once home freeze boxes started down the assembly line.

tiveness in agricultural leadership. Never one to look back, his whole philosophy was to deal realistically with the present and to plan for the future. His untiring efforts, guided by his extraordinary vision, were fundamentally directed to improving the diet of humans, of animals, and of the soil. Through this improvement he

supporting education to better living through diet.

Already Cornell University has filled the Chair of The Babcock Memorial Professorship by the appointment of Dr. Herrell DeGraff, formerly Professor of Land Economics at Cornell University. To farm people this is the most satisfactory appointment that could be made. It is equally gratifying to urban dwellers throughout the country. Dr. DeGraff is fairly young, a sound thinker and a courageous and effective speaker and writer. Men and women rally to the support of his teachings and both government and business are beginning to pay heed to the truths he utters.

Dr. DeGraff was reared on a practical farm in the Northeast. Although his appointment is to a chair of national influence, we as Northeastern farmers have the satisfaction of knowing that Herrell DeGraff is one of us.

## Announcement

Committees are now forming throughout the Northeast and every farm family through the leadership of the Grange, the Farm Bureau, and the Home Bureau will be contacted in behalf of the Memorial. H. E. Babcock served us for a lifetime. Now it's our turn.

The **MASSEY-HARRIS COMPANY**, Racine, Wisconsin, has a 40-page 1951 Buyer's Guide printed in 4 colors which they will be glad to send to you on request. Among the equipment pictured are the Depth-O-Matic 2-way hydraulic system from the 1-plow Pony to the 4-5 plow 55; plows, harrows, drills, planters, sprayers, combines, and corn pickers.

The **TRESCOTT COMPANY** of Fairport, N. Y., has a new portable orchard grader. It is the Trescott Model 60 with a capacity up to 100 bushels of apples per hour.

If you are planning to build, you will be interested in a booklet called "How to Build Farm Buildings That Last Longer." You can get a copy without charge from the **WEST COAST LUMBERMEN'S ASSOCIATION**, 1410 S. W. Morrison Street, Portland 5, Oregon.

Visitors to Yellowstone Park have pleasant memories of it for life. A natural way to get there is to take the **NORTHERN PACIFIC RAILROAD** and an excellent way to learn about it is to send a post card to Verne BeDell, Room 534, 630 Fifth Ave., New York 20, N. Y., and ask for a copy of his Yellowstone booklet.

A new fly killing insecticide has been developed by the **DU PONT COMPANY**. It is called **Du Pont Dairy Cattle Spray** and is a combination of methoxychlor and lindane, both of which have been approved by the **USDA** for killing flies in dairy barns.

Two new publications, "Modern Ways with Meat" and "Facts about Meat" are available from the **NATIONAL LIVESTOCK AND MEAT BOARD**, 407 So. Dearborn Street, Chicago, Ill.

Two new corn planters have been added to the **DEARBORN** line of farm equipment. They are the Dearborn corn planter and the Dearborn drill planter. Both are designed to attach to the Ford tractor.

G.L.F. has a Chemical Weed Control Guide which they will be glad to send to any subscriber on request. Just drop a post card to **G.L.F. SOIL BUILDING SERVICE**, Terrace Hill, Ithaca, N. Y.

The new No. 45 Papec Crop Blower has a 10-foot hopper and 380 sq. in. of throat-opening which give it a greater capacity than field machines on all types of material. An important feature is its tilting hopper, which can be raised quickly and easily to allow trailers or trucks to get into position for unloading without backing. An automatic locking device holds the hopper in the raised position so it cannot be blown or pushed over.

## SERVICE BUREAU Life Insurance for Farmers

**A**S with automobiles, baseball, and ice cream, the United States leads the world in the volume of life insurance in force. At the beginning of 1950 the total was 215 billion dollars—almost \$5,000 per family, or \$1,400 per person. Available information indicates that farmers own less than their proportionate share.

Everyone knows that life insurance guarantees payment to one's beneficiary in case of death. If the insured does not die, most life insurance will pay something to him when he cancels the policy, or, in the case of endowment insurance, when the policy matures. This payment to the insured in case he does not die makes most life insurance differ from other types of insurance. This difference means that in addition to protection, most forms of life insurance also provide a means for investment. The principal difference between the various kinds of life insurance is the varying proportion of protection and investment. Some people want life insurance which provides a maximum of protection; others want more investment. Therefore, life insurance companies provide a variety of policies to meet varying needs.

### Types of Life Insurance

The four basic types of life insurance are term, ordinary life, limited-pay and endowment. For a given face amount, they all provide for the same protection or death benefit. Term insurance has no investment feature, and the other types have increasing amounts of it. The premium per \$1,000 of insurance increases as the amount of the investment feature increases. For a given

amount of money, you can purchase the maximum of protection by buying the lower cost types.

Most farmers have need for protection. Unlike many salaried persons, most of them have ample opportunity to invest their surplus funds in their own farm business. This farm business also provides at least some of the wherewithal to take care of the farmer and his wife during old age.

The types and amounts of life insurance that a given farmer should buy depends on at least three factors: (1) the amount of protection desired, (2) the amount of investment desired, and (3) the amount of money available over the years to pay for life insurance.

When the amount of money available is so limited as to reduce the amount of protection below that desired, one can still get the maximum protection by purchasing the lower cost types of insurance. This, of course, would provide little for the insured during old age.

### Plan Insurance Program

One should attempt to plan his insurance program as far ahead as possible. Some young men find that before they are married, or buy farms, they have relatively little need for protection, but have sufficient funds to buy insurance. Such young men often buy limited-pay or endowment insurance. Within a few years some of them have gone in debt for farms and have fine young families dependent upon them. They need a great deal of protection to help provide for their families and pay debts in case the unexpected happens. The amount of money available to buy insurance is limited, and debt repayment affords ample investment opportunities. Such young men should then have the lower cost types of insurance or combinations of them in order to get the maximum protection for their families. Unfortunately, the insurance acquired earlier was not of those types and still requires premium payments which include a considerable amount of investment. It can be dropped, but only at a sacrifice. The insurance purchased under the earlier conditions no longer fits.

Your future cannot be predicted, but the earlier you can develop your insurance program to fit your needs the better. A reliable insurance man can be of great help in making the proper decisions.—G. W. Hedlund

—A.A.—

### GONE BUT NOT FORGOTTEN

On October 4, 1950, I sent a bank money order in the amount of \$229.95 to the Western Radio & Television Corp., 210 Fifth Ave., New York 10, N. Y., Robert Canyon, Pres. This was in answer to an ad which I saw in a Sunday paper, and was for a three-in-one console set. I received an acknowledgment promptly, but heard nothing further. A registered letter sent in November was returned unclaimed.

The above bank money order was cashed in Amarillo, Texas, where we have been told Robert Canyon was living at a trailer court. According to information we now have, a warrant has been issued for Canyon's arrest. If this fellow should turn up in this part of the country, notify the authorities.

—A.A.—

### HANG ON TO IT!

We sold some bulbs to a firm last year, and they sent us a check which bounced because of insufficient funds. They told us to send it back to them and they would make it good. We did but they didn't!

It is a criminal offense to write a check without enough money in the bank to cover it. If you hang on to a bad check, you are much more apt to get your money. If you return it to the writer, you have no evidence to hold over his head.

When the  
**CROP IS HEAVY**  
and the  
**GOING TOUGH**  
that's when Papec  
**SHOWS ITS STUFF!**

Papec owners repeatedly tell us of harvesting down and tangled forage with their Papec Harvesters, after other harvesters have either broken down under the load or found the crop just too heavy to handle. Papec's simple design and sturdy construction, plus the "know-how" gained by the Papec organization in more than 50 years of building feed machinery, are the reasons for Papec's superior performance.

There is a Papec Forage Harvester to fit your need exactly... Model 151D with either engine or power take-off assembly, for the average farm... Model 181 with its big 18½" throat, for large farm operations and custom harvesting.

See your Papec dealer for information on Papec Forage Harvesters and Crop Blowers, or write for new booklet to: Papec Machine Company, 397 N. Main St., Shortsville, New York.

Fresh bog spavin?  
"Clear it up fast  
with **ABSORBINE**"

says C. W. Pace of Longmont, Colorado

"As soon as I see signs of bog spavin, puff or soreness on my horses, I use Absorbine. That's the treatment advised by our veterinarian, and I have been using it for over 16 years."

Yes, farmers know there's nothing like Absorbine! It's not a "cure-all," but a time-proved help in relieving windgall, collar gall, and similar congestive troubles.

A stand-by for over 50 years, it will not blister or remove hair. Only \$2.50 at all druggists. W. F. Young, Inc., Springfield, Mass.

### NEW FORDSON TRACTOR PARTS

High tension magneto and bracket assemblies. Prompt shipment. Write for parts list. **FISK ALDEN CO.**, 132 Brookline St., Cambridge 39, Mass.

**IH dealers have the right tools and equipment for every service job. This saves waste motion . . . guarantees better workmanship. IH dealers have invested thousands of dollars in precision equipment, besides regular hand tools, to serve you better.**

# How IH dealers give you fast service

**IH-trained servicemen  
use precision equipment  
to do Blue Ribbon Quality work  
in less time . . . at lower cost**

**IH servicemen find trouble fast with equipment like this compression tester. It tells them in a minute whether piston rings or valves need attention . . . *without* removing the cylinder head. This speeds service on your farm equipment and saves you money.**

**They detect worn parts with tools like this valve spring tester. Weak springs which don't seat the valves properly may cause loss of power or valve failure. Here again testing rather than guessing can ward off unnecessary delays and costly repairs.**

**They restore like-new performance with tools such as this hydraulic press for straightening connecting rods. Close tolerances, within thousandths of an inch, can be maintained with these precision tools. As a result, IH trained servicemen can duplicate factory workmanship.**

**They take the guesswork out of service work by using precision gauges to make their work match IH factory standards. They prevent engine-crippling distortion by using torque wrenches to tighten bearing and head bolts just enough . . . not one turn too much!**

**THESE FIVE GIVE YOU COMPLETE**

*care that counts  
in the field*

- 1. IH Trained Servicemen**
- 2. IH Approved Tools and Equipment**
- 3. IH Blue Ribbon Certified Quality**
- 4. IH Precision Engineered Parts**
- 5. IH Pre-season Inspection for Scheduled Service**

**Look for the IH 5-Star sign when you need service! It's your assurance of prompt, precise service at a reasonable price. Your IH dealer has the men, the machines, the parts, and the know-how it takes to make McCormick equipment work better and last longer.**

FOUNDED 1842

THE FARM PAPER OF THE NORTHEAST

Goodbye,

“Bonnie Wee Farm”

**T**HE time has come when we must leave you, *Bonnie Wee Farm*, you with whom we have spent twenty-eight happy years. We named you “Bonnie Wee” when we came because you were such a good little farm, fruitful and beautiful. Here our two sons and daughter spent their childhood, watched the birds and listened to their songs, chased the butterflies, and saw the wild geese and ducks fly overhead. How they loved to tramp all over your fields and woods, and how they loved the little brook and the pond where they swam in summer and skated in winter.

Our house has been a mansion to us, the dearest spot on earth. What beautiful sunrises we had as we looked to the East in the morning; and nothing was more lovely than the sunsets at the end of day. Nowhere did the sun shine brighter than at Bonnie Wee.

We worked hard, and in return you gave us a good living. For twenty-five years, we had a retail egg route in Schenectady, and you were proud of your name on the truck in big letters—**BONNIE WEE FARM**. When it was loaded with eggs and chickens and honey and glads, and the boys and I were ready to start for town, it was a good feeling.

You fed us well and you made our summers bright with flowers—glads, roses, lilies, and so many others. And we shall never forget the good cats and dogs that we had: Pete and Tippy and Toby and Tony, and the rest. Toby was the most intelligent of them all. When he was outdoors and wanted to come in he would push the door open, come in, turn around and push it shut. We will always hold him in loving remembrance, for he never did a mean thing in his life.

And there was “Jimmy Horse” who always answered when we went out the back door in the morning and shouted “Hello, Jimmy Horse” to him. The day we had the circus and parade was a great day. First there was Jim-

my Horse hitched to the stone boat, and on the boat were the “wild animals” in crates: two dogs, three or four cats, some rabbits, and a few guinea pigs. Next came one of the children’s wagons with crates containing bantams. Then more wagons with crates of white ducks, brown ducks, yellow ducks, a few red roosters and red hens, followed by the goats. It was the greatest parade we ever saw, and how the kids loved it.

And do you remember the Christmas when the children put out hay for Santa’s reindeer, and in the morning the hay was gone and the kids found reindeer tracks all over the fresh snow? (That was the year we had the goats.) Remember how the children hollered for everybody to come and see the reindeer tracks?

Each spring, how we listened for the sound of the first peepers, and finally we would get our reward when someone would rush in and announce, “The peepers are singing!” We’d rush outdoors and, sure enough, we’d hear the song that only the peepers can sing, and we would know that Spring had come again.

And we’ll never forget, Bonnie Wee, the good people that came to the farm and bought honey of us during all those years. Some years we sold over a ton of it right here at the house. We kept 12 or 15 five-pound pails of the honey on the front porch, with the price marked on the pail, and a sign nearby which read, “Leave Your Money and Take Your Honey.” We set a dish there to put the money in, and of all those tons of honey that we sold this way, there was not one pail that wasn’t paid for! When people tell you everybody is dishonest, tell them they are wrong, for we know better.

We always tried to treat you well, Bonnie

By George W. DeRidder

Wee. We took care of the house, the pond and the waterworks, the

well, the ditches, the big henhouse, the brooder house, the fields, the fruit trees, the shrubbery, the roses and all the other flowers. And you treated us well and gave our children a good heritage. They learned to work hard, and to take responsibility, and you were just as proud as we were when they won 4-H awards. Do you remember how excited we all were when George was named Champion Victory Gardener in our county, and then in New York State and the Northeast, and he won a hundred dollar war bond and a trip to the National 4-H Club Congress? That was a happy time for all of us.

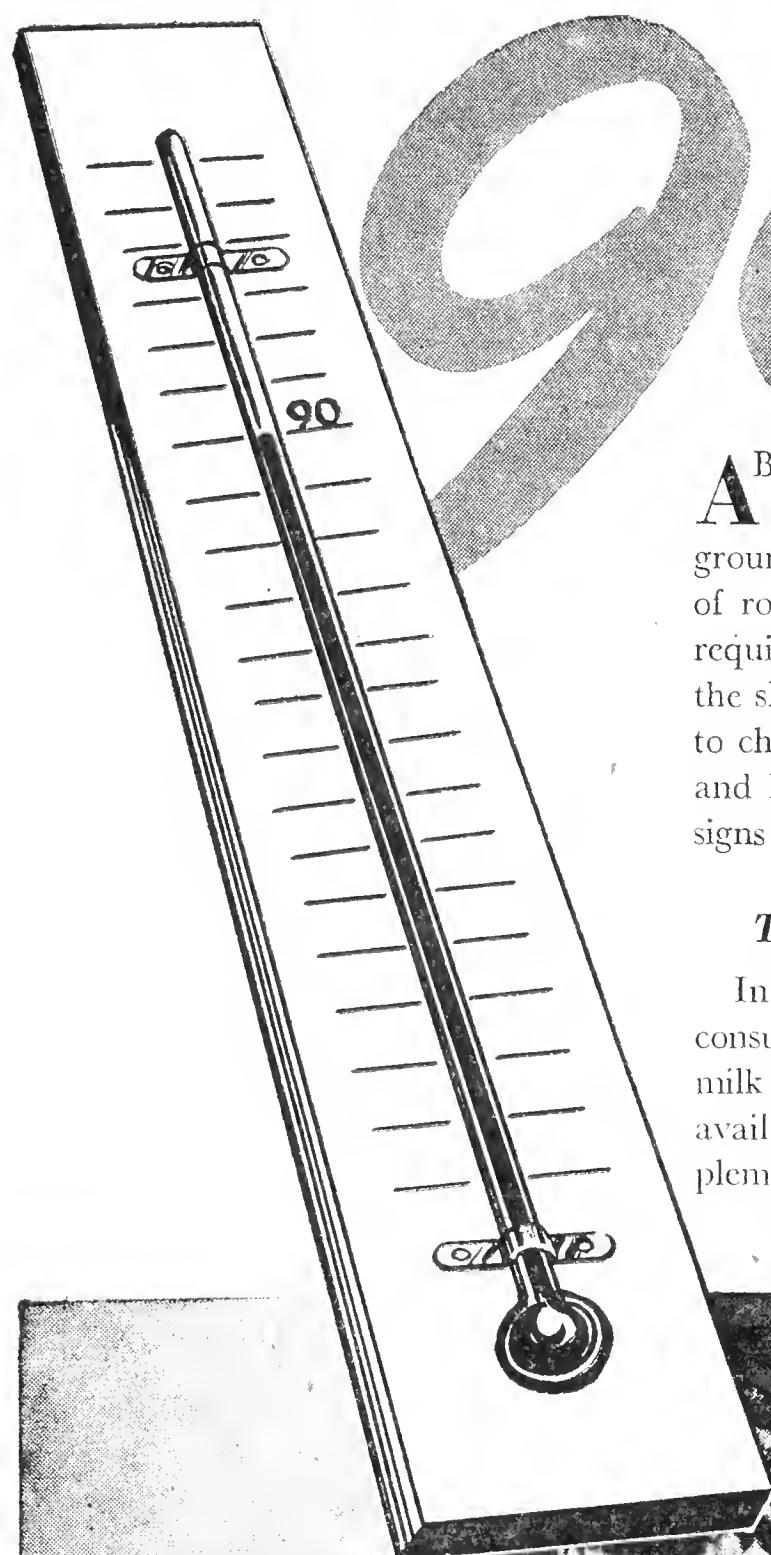

Bonnie Wee, we want you to know that we never wanted to leave you. Selling out and moving away from you is one of the hardest things we ever had to do, but we have no choice. The children have gone, and a man cannot carry on alone when he is seventy-five years old and not well. Our daughter and her husband have gone to a big dairy farm in Galway; George, Jr., to a city job; and Seymour, our oldest boy, who loved you best of all, gave up his life for his country in the last war. He was the real farmer, and if he had lived, he would never have left you, for when he was home on furlough, he told me that as soon as the war was over, he would be back on the farm to stay. But God willed it otherwise.

And now as the shadows lengthen on the trail that we have followed so long over the hills and through the valleys, we say “Hail and Farewell!” to you, Bonnie Wee Farm—the place on God’s green earth that we have loved best of all.

# 90° in the Shade

**A**BOUT this time of year, when the days really get hot, cows have to cover a lot of ground in order to get filled up. They often tire of roaming around, don't get all the feed they require and seem contented to just lie down in the shaded areas of the pasture. It's a good idea to check over your pasture conditions right now and keep a more watchful eye on the cows for signs of a coming drop in milk production.

### *Total Feed Consumption Important*

In order to avoid any great shrink, cows must consume nutrients in direct proportion to their milk production. If sufficient nutrients are not available in pastures, it's important to start supplemental feeding to make up the difference.

G.L.F. Flexible Formula feeds offer the most nutrients per dollar spent for supplemental feeding. Because the total feed intake is the important factor in maintaining milk production, it doesn't matter what protein level you decide to use. Just be sure the cows are getting enough total feed nutrients from pasture and grain. The cost per pound of total digestible nutrients in all of G.L.F. Flexible Formula feeds is about equal, regardless of the protein level you choose. This could only be possible with the G.L.F. Flexible Formula system which takes advantage of the best feed ingredient buys while maintaining a high standard of quality.

# How to Control Grain Weevils

By H. H. SCHWARDT

N. Y. State College of Agriculture

**S**TORED-GRAIN insects are becoming increasingly troublesome to flour millers and wheat growers in western New York. Although there is no indication that they are now more numerous than before, they have become highly unpopular with the U. S. Food and Drug Administration, the agency charged with protecting the public against foods of questionable purity.

Regulations now require millers to produce flour that contains no insect fragments. This seems to be a reasonable ruling destined for widespread approval since none of us likes to eat insects, live or dead, or pieces of them. And the millers want flour to be clean since a single buggy lot can spoil a mill's reputation.

But to mill clean flour the miller must have clean wheat. He must refuse "weevily" wheat brought to him from the farms, and sometimes that means he must turn down 75 per cent of the wheat offered to his mill. He doesn't like to do this, because he needs the wheat, and it spoils his friendship with growers who have been bringing him wheat for twenty years or so.

If he gets kind and accepts and mills some of this wheat, he may find himself in plenty of trouble. One segment from a grain beetle's feeler (you couldn't see it except with a microscope) ground up and mixed with 100 pounds of flour pollutes the whole lot in the eyes of the Food and Drug Administration and if the miller sells this flour and the pieces are discovered by an inspector, the miller can be fined or even sent to jail.

## Inconsistent

There are other considerations that make it difficult for the miller, and in turn for the farmer. It is well known that if all wheat containing a few weevils was channeled into livestock feed, there would not be enough flour for our own people, to say nothing of our hungry foreign neighbors. To take care of this unwanted exigency the federal grain standards provide that wheat can be called weevily only if it has two or more live weevils, or five or more live bran bugs in a kilogram (2.2 lb.). If it has only one weevil or three bran bugs in a kilogram, it is not officially "weevily" and cannot be graded down by a miller or any one else because of the bugs it contains.

The miller therefore may have the unfair burden of producing fragment free flour from wheat that contains about 50 weevils per bushel. The situation may force him and others out of the milling business and destroy valuable local markets for the wheat grower.

In Northern states like New York, the problem should not be impossible to solve. Weevils do not fly to the field here, as they do in the South, to

infest the ripening grain. They lie in wait in nearly empty farm grain bins or in a feed box, or even in accumulations of hay dust in the barn. When the clean new wheat comes in from the field, they crawl into it. If you fumigate them out of the wheat, a new batch of them moves in as soon as the fumigant has diffused out of the grain.

## Disinfection is the Answer

The obvious answer is to clean up both the barn and the bin before the new crop is put in each year. The bins should be completely emptied, swept out, and sprayed with DDT, using 10 pounds of the 50 per cent wettable powder in 100 gallons of water. Clean up all accumulations of old grain and feed in the barn. Remember that a handful of grain, bran, dairy concentrate, laying mash, or even dog food, can produce enough bran bugs to infest several bins of wheat. If you have a combine or grain drill stored in the barn, see that it contains no grain. Piles of feed sacks left around for more than a month in summer may give rise to bran bug infestations. Get the sacks back to your dealer as fast as possible. Keep a close watch for grain insects on incoming sacks of feed and spray them with a pyrethrum household spray if any are seen.

If wheat or other small grains are regularly grown as a cash crop, it will pay to build a storage bin apart from the barn so that it can be kept entirely insect free. Grain so stored can be fumigated with reasonable expectation that reinfestation will not occur before the grain is sold.

A separate storage house, properly built, is easy to keep clean and easy to fumigate. In addition, it can be kept at outdoor temperature during the winter so that any bugs it contains will be frozen or cooled to a standstill. It can be made rodent proof and thus stop another serious source of loss. If dry beans are grown, the separate storage house will also provide an excellent place to keep them away from bean weevils and rodents.

Prefabricated steel bins are available and are better in many respects than those of wooden construction. Being round they are easier to clean, they are weather tight, rodent proof, easy to fumigate, and allow the grain to cool faster when fall weather comes. There are no cracks and bugs cannot burrow into their walls.

Wheat growers in western New York will find it increasingly difficult to market weevily grain for milling purposes. Wheat stored on the farm from harvest time until the following spring or summer is likely to become infested unless careful clean-up and spraying routines are followed. Separate storage buildings are easier to keep insect and rodent free than are bins built into the barn.

Close up of rice weevils at work on wheat. The insects lay their eggs in the kernels. They hatch into weevils which eat the wheat and make it unmarketable. The snow-like residue on this untreated grain is frass left by the insects.

## PRICE CONTROLS CAUSE INFLATION

**B**Y A VOTE of 169 to 145 Truman and his politicians won the first round further to regiment the American people by his strict price control program. That is not a final victory, however, for at this writing there are still many amendments to be passed on by the House of Representatives, and the Senate still has to act.

Never to my knowledge has any Administration brought pressure on the people's representatives in Congress on any bill as Truman and his price controllers have done this time. A famous radio commentator said the other night that every prominent radio commentator in America had been told, or practically ordered to tell the American people to write their Congressmen for price controls, for if they did not the cost of living would go up at least three hundred dollars during the year.

Any politician or bureaucrat—I don't care who he is—who makes such a statement is either a fool or a liar. Price controls is a device for Hitler-minded men to control the destinies of the American people. Instead of preventing inflation, price controls help to cause it. For example, in the City of Rochester, New York, alone there were at the latest count 53 federal employees, or government snoopers, to enforce the price control legislation, and more were being added every day. Add to this the similar or larger number for practically every city in America and you get some idea of the vast army of tax-eaters who are taken from productive work and placed into government non-production.

The hundreds of thousands of government employees alone, plus the worst extravagance that any government in history has ever indulged in are the real causes of inflation, and of the resulting high cost of living.

They talk about the need for controlling meat prices. The reason why meat prices are high is the consumer demand for the highest cuts of meat. Price controls will mean black markets in meat and in every other commodity where they are used. Price controls in meat mean that the meat animals for the most part pass up the feeding lots, where 50 or more additional pounds are added, and go directly to market from the farms. This means eventually a smaller supply of meat and poorer quality. I write earnestly and emphatically on this problem of government controls because I am as sure as I am that I am alive that unless the American people realize what this government is doing to us and for our liberties, and do something about it by registering their feelings in telegrams and letters to their congressmen, we are headed toward complete regimentation, loss of our liberties, and the ruin that now prevails in England and the rest of the Old World, largely because of the same causes.

## GRANT G. HITCHINGS

**W**ITH the passing of Grant G. Hitchings of Onondaga County, New York, at the good age of 88, the apple industry lost a pioneer and America a good citizen.

How well I remember the controversy Mr. Hitchings started, when I was a young teacher of agriculture many years ago, when he insisted that the best way to grow apples was with sod mulch! It was the time when nearly every pomologist and fruit grower believed that the orchard should be cultivated all of the time. Mr. Hitchings said you could save much work, cut down the cost of production and grow better apples by leaving the orchard in sod after the trees were grown, and by cutting and leaving the grass on the ground. Now, of course, the sod mulch method is a general practice.

On his big fruit farm of 440 acres, with 315 in

*By E. R. Eastman*

apples. Mr. Hitchings pioneered in many other ways. He constantly watched for new developments both in machinery and in growing and marketing methods. His partnership with his three sons was, he felt, a major influence in keeping him open-minded and watchful for new methods.

AMERICAN AGRICULTURIST named Grant Hitchings a Master Farmer in 1939, and only last year the New York State Horticultural Society made him an honorary life member of that fine Society. He also was a Gold Sheaf member of the Grange, as is his wife.

Like that of other good pioneers, Grant's fine work will live on.

## FAIR TIME MONEY

**O**N MY desk as I write there are several very interesting Fair premium catalogs, including one from the New York State Fair, which will run from September 1 through September 8.

At both county and state fairs there is opportunity to pick up considerable premium money if you just try for it. In almost every farm and garden there are at least one or two products better than anyone else is likely to have. Almost every farm woman knows how to do an excellent job of canning fruit, or making a rug, or what have you, that has a good chance to win a prize if pains are taken to exhibit it. Farm boys and girls with their knowledge of how to grow farm products and animals have good chances to get prize money and valuable experience at the local and state fairs.

If you don't have catalogs, write for them, study them, then try your luck at exhibiting some product or animal of which you are proud.

## A DAIRY PROGRAM IN A NUTSHELL

**C**OMPETITION of other products with fluid milk is increasing from other dairy sections of the United States. Some milk concentrates are hard to tell from fluid milk when water is added. Our milk sheds are constantly widening. Here is a boiled-down program by which northeastern dairymen can meet this increased competition:

### BETTER PASTURES

More and more farmers are realizing that pastures that start early, keep good through the hot weather, and stay late are the best crop on the farm.

### BETTER ROUGHAGE

This includes especially more alfalfa, ladino, birds-foot and the use of newer and better grasses and grass silage.

### MORE HOMEGROWN GRAIN

This is possible now through hybrid corn varieties and corn pickers.

### BETTER COWS

Made possible by better selection; better breeding; use of artificial breeding; better knowledge of each cow through DHIA or other records; better growing of young stock.

It is plain that no matter how good a dairyman is, there is no point in growing good pastures and crops only to feed them through the bottleneck of poor cows.

### DAIRYMEN MUST ADVERTISE

Every other successful business does. There is need of more support for "Milk for Health," the

Dairy Councils, and of every other effort to tell consumers about the great food value of milk.

## MARKETING ORDERS

Marketing orders are good, providing dairymen and their organizations have at least an equal voice with government in their making.

## COOPERATIVE MARKETING IS ESSENTIAL

Here again it matters not how good a producer a dairyman is if his product is not well sold. A good cooperative organization is the only way a dairyman can have any voice in the marketing of his products.

## MEMORIES

**T**HIS nice summer morning just at daylight I awoke to hear a dog barking up across the hill. I'm quite sure that he had cornered a woodchuck. Immediately I was carried back across the years to other summer mornings in the country when perhaps I had been rounding up the cows and "Old Maje" had got between a woodchuck and his hole.

This thinking led to memories of summer evenings on the front stoop with the folks—Father, Mother, and brothers—while, to the tune of the bullfrogs in the nearby creek, and watching the fireflies winking at us across the lawn, we visited lazily, waiting for the hot rooms upstairs to cool off so we could go to bed.

How all of us would like to turn back the clock of time and see and visit again with the old friends and loved ones long since gone! We cannot do that, but I told a class of high school graduates a few days ago that what we can do is to make sure of what we have. There is a homely old adage that "you cannot read your tombstone when you are dead." It does little good to heap the casket with flowers after a lifetime of neglect or indifference. How really seldom do we commend and praise and show appreciation to our friends and our loved ones! How frequently we hurt them with criticism or what is just as bad, with indifference! The failure, for instance, on the part of young people to write home to Father and Mother, to remember all the little niceties of life that make for right living. How often we alibi ourselves for failure to say or do the things that prove our friendship and our love. We say we have been so busy that we just haven't had time. But the day will come all too quickly when the old home, and Father and Mother, will be gone, and it will be no longer possible for those who have left home to make the trip back or to write or say the word of appreciation.

It will mean much to you and especially to those who love you if you tell them, and tell them often what they mean to you.

## EASTMAN'S CHESTNUT

**I** WILL BET every one of you who read this chestnut, (sent in by F. J. Beck of Dolgeville, New York) has had a similar experience with strangers over-burdened with curiosity:

Dropping into the seat on the train with a man who had his arm in a sling, the stranger began his inquisition:

"I'll bet you broke your arm, didn't you?"

"Yes, I did."

"Fall off something?"

"No."

"Got hit by somethin'?"

"No."

"Don't tell me you broke it on purpose?"

"Well, I did it, but not on purpose. I was trying to pat myself on the back."

"Gosh Amighty! What in the world did you want to pat yourself on the back for?"

"For minding my own business so well!"

### It Sure Pays to Feed Farm Animals

# SALT PLUS!

# AA's Farmers' Dollar Guide

**PUBLIC RELATIONS:** One of the most frequently discussed topics at all meetings of farmer groups and farm organizations this year has been "public relations." Newspaper columnists, radio commentators and many of the editorial writers have fallen for the propaganda being peddled by some of our Washington hired hands to the effect that prices will skyrocket unless we continue price controls. They are telling the housewives of the country the stories the "control boys" are putting out and thereby making farmers look as though they are all selfish millionaires.

Our government taxes us for all the money they need for the "information services" offered by almost every division of the government. These information departments then devote their time, at our expense, in trying to convince Mr. and Mrs. America that their departments are essential; that the country would collapse without the services, controls and other social programs the bureaucrats want.

The administration got especially active along 'control' lines a few weeks ago when there was the first sign of the tension easing in Korea. They know that a cease-fire order in Korea, plus anticipated good crops, will ease demands and that in the ordinary course of the old law of supply and demand, most prices will ease off—and the control boys would be out of a job!

Farm groups don't have the money to combat such tactics on the part of our Washington 'servants' although most of them are doing what they can to interpret the farmer's position to Mrs. Consumer. Every farmer must take it on his own shoulders to help establish good public relations with consumers. At every opportunity we must point out to our city cousins and to each other, because we are all consumers, that price controls which discourage production, will never put more food on America's tables.

If we really want the good will of our customers, then we must also question the whole matter of price supports. We can't tell America that we don't want price controls when the price level is high but that we do want government help when prices are low!

**PEACE AND PRICES:** As this is written (July 11), it seems fairly certain that open hostilities will end soon in Korea. If shooting stops, we must remember that it will be because Red Russia approves and wants a peace—perhaps to build its strength for a few years before starting another chapter in their cold war program. Experts are saying that Stalin will make all sorts of demands on us and the United Nations—and that he'll probably get away with them because we are all sick of the crazy situation which gives us no opportunity to fight our real enemy. However, no one dreams that a cease-fire will bring world peace.

Prices started slipping back when there was just a rumor of peace in June; dropped more with negotiations for an armistice; and will go lower when shooting is stopped in Korea. But farm prices are not going to pieces. For a while it may look that way on some products but the defense program will go on, employment will stay high and, with money in his pocket, the consumer will continue to eat at the first table. Even the USDA is beginning to realize that our annual food production is not keeping up with our great growth in population. The chances are that in the long run, farm prices will keep pretty well in line with general price trends, if we keep away from artificial controls.

**VEGETABLE CROPS:** With plenty of rain and warm temperatures, most vegetables made good progress in June. The sweet corn crop looks good throughout the Northeast as do the crops of carrots and tomatoes. Yields and quality of cabbage in most sections are so good that prices have dropped to where some growers are abandoning their crop.

**MEAT PRICES:** Indications are that a cease-fire order might prompt cattle feeders to unload high-cost animals in a rush to market to avoid loss. A glut on the market would naturally bring a price-break. It should be remembered that the beef supply is limited and the demand good. If there is a price break, it probably will be temporary. Hogs are a different story. Prices would decline with beef but price recovery would be slow as a huge crop of pigs will be ready for market this fall.—A.J.H.

## The Song of the Lazy Farmer

**OCCASIONALLY** I'm took to task by folks who'll get up nerve to ask: "How can you stand to loaf all day? Why, we'd go crazy quick that way!" If that's the case, of course, they need to keep on workin' at high speed, because it's my philosophy that ev'ry-one should do what he enjoys the most and likes the best—in my case it's to sit and rest. I s'pose I'm built the wrong way 'round, but it so happens that I've found whenever I have work to do it drives me quickly crazy, too.

That only proves a fact that's old—men just ain't poured out of a mold. Each one is diff'rent than the rest, and who's to judge which one is best? I claim the thing that each should do is what makes him the happiest to; what purpose would there be, let's say, for me to put up hay all day when all it does is make me mad and turn my disposition bad? When I sit in the shade and smile, that's better by a country mile than if I spend my time in toil until my blood begins to boil. Mirandy likes to play that she is always sore at lazy me, but she knows life is happiest for her when I am laziest.

## QUONSETS

Storing Potatoes in Maine

Corn Drying and Storage in Iowa

Dairy Barn in Minnesota

Housing Farm Machinery in Texas

Cottonseed Storage in Alabama

FARMER'S FAVORITE . . .  
EVERYWHERE!

Quonsets are all steel. They are wind-resistant, non-combustible. They are quick to erect. They are reasonable in cost. (Total in-place cost will surprise you!) They are versatile. They are strong and long-lasting . . . made of arch-ribbed, nailable Stran-Steel framing.

All over America you see them . . . Stran-Steel Quonsets . . . on farms of all types and sizes.

There are many reasons for such preference for this busiest of all farm buildings.

The Quonset is versatile . . . perfect for crop storage, housing livestock or machinery, and dozens of other uses. More than that, the Quonset is an efficient, shirt-sleeved working tool that increases production, cuts legwork and back-breaking drudgery to a minimum.

Doubtless you know someone who has a Quonset building on his farm. We suggest you talk to him. Or call in your Quonset dealer and get a list of the farmers in your section who have solved the farm building problem—profitably—with one or more Quonsets. Use the coupon for valuable information on buildings best suited to your type of farming.

Quonset 32

Quonset 24

Quonset 40

Use this coupon for information about Quonsets as a farm production tool. We will include data on sizes, colors, and the name of your nearest Quonset dealer, from whom you can get the detailed costs.

What Do YOU  
Think?  
By JIM HALL

**A**BOUT a month ago, I got in my car and drove across central and eastern New York, across Vermont into New Hampshire, down into Massachusetts, and back a different way across New York to Ithaca. I was looking for information for our cattle stealing article, calling on farmers, state police, and county agents but at the same time keeping my eyes open for what else I could see. Even after seeing it with my own eyes, I find it hard to believe that so many farmers put up grass silage this year.

It seems just the other day—but actually was back in 1948—that AMERICAN AGRICULTURIST went all out with contests, prizes, and booklets, urging the use of early cut grass for feed as silage. Perhaps you'll remember that we ran article after article pointing out the economies of putting up grass silage; telling what, when and how to ensile grass with and without preservatives; and pointing out that it was a type of insurance against dry summer pastures and also freed some acreage for corn for grain.

Our all-out efforts to encourage the use of grass silage came only after long years of watching the progress of it on the farms of the late Ed Babcock and Tom Milliman where they first started using it about 18 years ago, and at the New Jersey State College Farm where Carl Bender had been canning grass since about 1916. The year we really started pushing the new practice, only a little better than 3% of New York's dairymen put up grass silage. The next year it jumped to 13%, and now various county agents estimate that somewhere around 20% are making grass silage.

Now the New England Green Pastures contest brings us some real figures that are not estimates. According to Ralph Littlefield of the University of New Hampshire, who compiled the records, "In 1950, 15 of the 30 county winners made grass silage." Ralph says the interest is continuing to increase from year to year and that a lot more farmers are making it for the first time this season.

Lester Smith, extension agronomist at the University of Vermont and chairman of the Vermont Green Pas-

tures Committee this year, recently announced that of the 1,185 Vermont farmers in the Green Pastures contest this year, 402 planned to put up grass silage. That is 33.9%!

## Some Shopping List!

Verle Houghaboom of the Green Mountain extension service, reports that machinery purchases planned by Vermonters this year also indicate that more men are adopting Green Pastures suggestions and are putting up grass silage. Owners report that the majority of their machines are in good condition, but here are a few of the things they plan to purchase during this year: 1,539 side delivery rakes, 918 ensilage cutters, 1,133 lime sowers, and 1,003 manure spreaders.

But that's only a part of their shopping list. In the supply line, they have or are going to buy this year: More than a million feet of water pipe; more than 100,000 squares of metal roofing; 753,700 bags of cement; more than half a million feet of electric wire; a quarter million rubber teat cups; and 50 thousand rolls of barbed wire. Of course there are a few other odds and ends like 60 thousand bales of binder and baler twine; 13 thousand bales of baling wire and 7,100 spools of electric fence wire.

Add to that thousands and thousands of tons of lime, fertilizer, and seed, thousands of electrical appliances for home and barn, the new cars and trucks, all the shoes, clothes and food, all the gas, oil and tires bought by these 19,000 Vermont farm families and it's easy to see that farmers are the biggest and best consumers in the land!

## Irrigation

Elsewhere in this issue of AMERICAN AGRICULTURIST is an article I put together on irrigation of pastures and hayland in the Northeast. As you'll note, I'm pretty enthusiastic about the possibilities after talking to and corresponding with a lot of farmers who have tried it. For instance, when I stopped in to see County Agent Ray Pestle at Brattleboro, Vt., he told me 10 men in his Windham County had irrigation systems of various sizes and

(Continued on Opposite Page)

It is time to begin to train animals that are to be shown at fairs. This young fellow is learning to behave while being led. He is also starting to get a "hairdo" which, by fair time, will make his coat so sleek that admirers can almost see their reflections in it. Showing animals and crops at fairs can bring in pin money and furnish fun, and exhibitors are certain to learn the fine points or shortcomings of their entries.

## Artificial Breeders' Cooperative Presents 11th Annual Program

**D**OCTOR W. E. Petersen, eminent dairy scientist and member of the faculty of the University of Minnesota for more than 30 years, will be the principal speaker at the 11th Annual Meeting of New York Artificial Breeders' Cooperative, Inc., August 4, 1951 at Ithaca.

Dr. Petersen will talk on "More Economical Milk Production Through Better Bred Cows and Better Utilization of Roughage." He has received two international awards for his contributions to the dairy industry. While perhaps best known for his studies of milk secretion, he has during the past few years devoted much time to studies of grassland farming operations. In connection with his work on grassland farming, he has visited England, Australia and New Zealand to study methods used there.

The afternoon session will also include election of three directors from NYABC Districts 4, 5 and 6; one director to fill the unexpired one year portion of the term of the late James L. Sears who was District 3 director; and one director to represent the Jersey breed on the NYABC board. Delegates will represent 68 local dairy cattle artificial breeding associations in New York and Western Vermont which are affiliated with NYABC. In addition to the election of directors they will take action on proposed changes in the by-laws, consider the advisability of providing beef sire breeding service, receive officers' reports, and discuss general progress of the program.

Feature of the morning program will be a competitive Cattle Show in which \$3,232 in 209 premiums and awards are offered to natural or artificial daugh-

ters of all five dairy breeds of sires that are or have been at NYABC headquarters in the service of members' herds.

Judging will start at 9 a. m. Judges will be Hilton Boynton, extension dairyman at the University of New Hampshire, and John Dewey, Editor of the Ayrshire Digest. Superintendent of the show is Harold Rosa, assistant manager of NYABC.

### MARYLAND 4-H TEAM WINS INTERNATIONAL CONTEST IN ENGLAND

Maryland's 4-H dairy judging team walked away with the international contest at the Royal Show in Cambridge, England, on July 4. With seven teams competing from different countries, the Free Staters, representing the United States, won by a good margin. The team was presented a gold challenge trophy by the London Daily Mail.

The four members of the team rang up a score of 1,627 points, edging out the runner-up, England, by 70 points. The Free Staters came out on top in the placing of three of the four classes: they ranked first in the British Friesian, Guernsey, and the Shorthorn classes. Their score was the second highest in the judging of Ayrshires.

Members of the victorious team are Barbara Riggs, 18, Gaithersburg, who was highest scorer in the contest; Janice Palmer, 19, Olney; Glen McGrady, Jr., 17, Rising Sun; and Robert Barton, 20, Queen Anne. They were coached and accompanied to the contest by John L. Morris, Extension dairyman of the University of Maryland, and Roscoe Whipp, assistant agricultural agent of Montgomery County. Mrs. Frank Palmer, mother of Janice Palmer, also accompanied the team.

— A. A. —

### WHAT DO YOU THINK ?

(Continued from Opposite Page)

that every one of them was very pleased. Of course there wasn't much interest in irrigation in June because it seemed to rain every day but July, August and the forepart of September usually present a different story.

I believe it was the late Henry Talmage of Long Island who went back through the records and discovered that for 22 years every summer had been dry for at least two weeks. Even this year meadows and pastures got a slow start due to the May drought. I'm betting that 10 years from now a very large percentage of farmers with enough water will have irrigation systems. What do YOU think?

### Heifers or Bulls?

A few weeks ago I mentioned here an idea a dairyman passed on to me about why he thought his cows had more heifer than bull calves. Right after that, while I was out of town, a Mr. J. F. Goddard called and left the message that he could tell how to get cows with calf of either sex wanted. Since then, and between road trips, I've been trying to find Mr. Goddard's phone number or address. I've tried Farm Bureau, Soil Conservation and other places without luck. However, whenever I mention that I'm looking for a man who can tell me how to have all heifer calves if I want them, the farmer I'm talking to always says, "If you find him let me know. I'll pay cash for that recipe." One man said, "That knowledge would be worth \$500 to me." I think it would be worth even more to some operators. Well, whatever the idea is worth, I wish Mr. Goddard would call again and if I'm out, leave his phone number or address. Or his formula. My curiosity is burning me up!

## Thirty Years at DIE-KOHL FARM

By ALLIENE S. DeCHANT

**M**Y idea was always cows," says Clarence S. Dietrich. At 54 he shares with his only son William, the ownership and management of one of the finest dairy farms near Kutztown in Berks county, Pennsylvania.

A pioneer in the purchase of modern machinery, he and his son value their equipment at approximately \$25,000. "Our equipment," he says, "is adequate for 700 acres, and since we farm only 300, we do custom work, offering our services to farmers in an ever-widening area. The first year we baled 50,000 bales of hay and straw. To date our total approximates 350,000. Recently, with our combine we cut 18 acres in 10 hours, netting 272 bags of wheat. With our forage harvester we can fill an 18-foot wagon in 12 minutes. We also help farmers with our two-row corn picker."

Farmer Dietrich prides himself most on the purebred Holstein dairy herd he and his son have acquired over a period of years. Each cow is artificially bred by a proven sire, T.B. tested, and free from Bangs' disease. "I began with five," he told me, "a mixed lot, because I didn't have money for more. Now our average is 20 milkers and 11 heifers. Milk always brings a steady income."

Mr. Dietrich takes just pride in the

"I bought things gradually," he remembers, "and in the Fall of 1920 purchased our first manure spreader. A year later I plunged again and acquired our first tractor and plow, which we traded for a new one in 1926. Our first rubber-tired tractor was procured in 1938. Now we farm the original 133 acres plus 167 rented ones with four tractors, a combine, baler and forage harvester and other tools. Three of the machines have auxiliary engines. Recently we installed a hay dryer in the barn."

Clarence attended two schools in Berks County: Center, in Greenwich Township, and Stein's, in Richmond Township. At 15 he was hired out at 50 cents a day, when a man's wage was a dollar. At 17 he began work with William Sunday, with whom he stayed for five years.

"My first job," he said, "was to spread manure that was stacked man high in the barnyard. We spread it spring and fall. We used five horses and a manure hook. I also had to spread manure while plowing, which was a slow, tough job. I used a spring harrow which was only six feet wide, hitched three horses to it and harrowed an 18-acre field. I could go the length of it only twice in half a day. I thought I'd never get done—up and down, up

Clarence Dietrich at the wheel of one of his five "Lehigh Valley Cooperative" trucks.

fact that in 1934 he was among the first day shippers to the Lehigh Valley Cooperative Association (formerly the Lehigh Valley Producers Association.) He attended the second meeting of the board of the new organization, since which time he has been one of its leading backers. He pioneered for members and had a tough time persuading some farmers "to help the thing along," for they were skeptical despite the jump in price. "Sometimes I was out until midnight talking with farmers. Now it is easy, and farmers outside our 30-mile radius clamor to join."

Machinery has always fascinated Mr. Dietrich. His first purchase of machinery for himself was made at the Kohler homestead, when his father-in-law, the late John Kohler, quit farming and rented the 133-acre property to the Dietrich newlyweds. The farm is now called the Die-Kohl farm — 'Die' for Dietrich and 'Kohl' for Kohler.

and down! When I was 21 my wages went up to \$30 a month."

A staunch Lutheran, Mr. Dietrich has been a deacon at New Bethel (Zion's) Church, Grimville, and is regular in attendance. His son William, daughter-in-law, and grandson occupy the same pew. When the new church was built he assisted by hauling stone from the Kohler quarry near Lyon Station, a 10-mile trek from the farm, to the quarry and then to the church. "Had a team of good horses," he says. He also hauled the heavy iron girders.

"Farming is a 365-day-a-year job," says Mr. Dietrich. "Much money is tied up, as compared with my boyhood days when a farmer could make a good start with a thousand dollars. Farming is far more interesting to me now," he adds, "and I wish I were physically able to work 18 hours a day at it. But I've got to slow up and relax, and that's a tough assignment!"

## Every farmer faces this hot-weather problem

The soaring temperatures of summer weather put an extra strain on men in the fields. That's true of machines, too, and the fuel they use.

Maybe you've noticed yourself that your tractor doesn't perform as well after hours of hard, hot work? Or you've had your truck or car heat up and stall? Had a hard time getting it going again?

A lot of such problems are caused by summer heat right at the time when engines must work their best. Then, dependability has an extra value to you.

That's why Gulf *specially blends* its two great gasolines—No-Nox and Good Gulf—for summer operating conditions; to give you the best kind of performance in hot weather. For example:

**ECONOMY.** You use fewer gallons per hour in the field because summer-grade No-Nox and Good Gulf Gasolines resist hot-weather evaporation. For every kind of work these fine fuels give you even power and smooth idling.

**STEADY POWER.** Gone are the balking and stalling so often caused by hot-weather vapor-lock. For light and heavy trucking, you can get top efficiency with summer-grade Good Gulf or No-Nox Gasoline.

**SMOOTH POWER.** Gulf's summer-grade No-Nox Gasoline is specially made to give you freedom from the hot-weather knocking and pinging that usually grow worse as temperatures soar.

For Summer work or relaxation, use  
**Gulf SUMMER-GRADE gasoline**

power-FULL to bring out FULL power in your tractor, truck and car

Combining on a  
half gallon of fuel per hour  
with a **Sheppard**  
**DIESEL**

$\frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$   
THE FUEL THE PRICE THE COST

FRANK C. MACKLIN of Ashton, Illinois, writes . . . "pulled a combine for approximately 29 hours on 15 gallons of fuel. On a power take-off driven forage harvester I used approximately 11 gallons of fuel on a ten hour run."

Saving 75% on tractor fuel costs with a Sheppard Diesel is one way you, too, can beat rising farm costs. Get the facts on a Sheppard Diesel and its many big *plus* features. Mail coupon today.

### Farmall "M" Owners

You can convert to Sheppard Diesel power right now. The 6M Sheppard Diesel was designed especially for your tractor . . . can be installed in less than a day to give you, too, a 75% fuel cost savings. No alterations to frame. All present implements can be used. Check coupon for more details.

## The F.F.A.—Four-H Way of Getting Started in Farming

**I**N SPITE of the large amount of capital needed for a start in farming these days, young men are doing it. As farmers retire, younger men must take over unless we are content to look forward to a time when most profitable farms will be owned by absentee landlords, either individuals or corporations.

In the May '19 issue we told of a successful father-and-son partnership in Allegany County, N. Y., where the junior partner may eventually own the farm. Similar partnerships are being formed between older and younger farmers who are not related.

Another successful way of getting

is preparing himself to take more and more responsibility.

Leon Button, who lives a few miles away, is a dairyman. His father has a full-time job off the farm, and Leon and a younger brother shoulder a large part of the responsibility for operating 417 acres.

Leon owns 5 purebred Brown Swiss cows, a bull and 7 heifers; also 75 ewes, 2 purebred sows, and a small poultry flock. His knowledge of cows has been increased by showing at fairs. He has a couple of blue ribbons from the State Fair and many from the Yates County Fair.

Realizing that good roughage is the

Leon with "Heidi" who was grand champion 4-H cow and reserve grand champion in the open class at the 1950 Syracuse Fair. She also took second place in the gold medal group at the International Dairy Exposition at Indianapolis in 1950. Leon has a big start toward owning a herd of Brown Swiss cows.

Ralph Francisco looking at some pullets that have just been moved to clover range. Ralph has accumulated hens and equipment, including a part interest in a bulldozer.

started is through 4-H membership or Vocational Agriculture in High Schools, or both.

Two young men living near Rushville, N. Y., Ralph Francisco and Leon Button, illustrate this method. They are not yet farming entirely on their own, but they are on their way. During their four years in high school, they established reputations and built up inventories which will go a long way toward eventual farm ownership. These years were used for the relatively slow process of growing livestock. When they finished high school, they already had cows and hens ready to produce.

Ralph Francisco is a chicken man. In addition to owning 475 White Leghorn breeders he has a part interest in a bulldozer, owns brooder houses and other equipment, and has a sizeable bank account. Total assets on a conservative basis are close to \$6,000.

Of course, capital isn't everything. What about Ralph's knowledge of poultry? He has built brooder houses, wired houses for electricity, mixes his own poultry feed, and culls and vaccinates his flock. A year ago he attended a four-day school at Cornell where he learned to select poultry breeding flocks under the New York Poultry Improvement Plan. He used the knowledge gained on his and his dad's flocks but he is qualified to select breeders anywhere in the State under the State Plan.

The home farm has about 7,000 birds and hatches 27,000 chicks a year to raise and to sell. Ralph says his dad hopes to retire some day and that he

foundation of profitable dairying. Leon has removed brush from 20 acres of pasture, has fertilized and seeded it, and plans to increase the improved acreage.

To check on milk production, he joined the D.H.I.A. and the New York Artificial Breeders Cooperative. To control Bangs Disease, the herd is enrolled in the State Bangs Disease Eradication Program. His net worth totals better than \$6,000.

Needless to say, not all boys have taken advantage of the opportunities of high school vocational agriculture to the extent that Ralph and Leon have. Many are doing it. For example, there is Frank Arnold who also lives near Middlesex and who was State FFA president in 1949-50. His Ag teacher, Henry McDougall, tells me Frank owns stock and equipment to operate a farm of his own. What's more, he has the helpmate to do it, as he was married recently to Leon Button's sister.

In this great Northeast about 3,000 farm boys graduate with training in vocational agriculture each year, which means that 30,000 have graduated since 1941. Add to these the army of boys and girls who have had 4-H training and I doubt that you will worry much about family farms disappearing. These young folks expect to farm for themselves.—Hugh L. Costline.

# Hang up the Shovel

## Let the G.L.F. Stable Cleaner Do the Dirty Work

ONE by one, some of the hardest jobs on the farm have softened up as electricity took over—milking, carrying water, cleaning eggs. But still the dirtiest chore of all, the back-breaking, most disagreeable day-in and day-out job on the farm has remained. Cleaning the cow stable every morning was still a job for a man and a shovel.

Now this chore is going the way of all the rest. After two years of research, trial and error, study, development, and testing on practical dairy farms, G.L.F. has a stable cleaner that works. It can clean out a 90 foot gutter—clean—in less time than it takes to milk one cow. It is doing just that, day after day, on a number of farms right now.

### Easy to Install

The G.L.F. Stable Cleaner is easy to install and simple to operate. Any farmer who has one will tell you, "You don't have to tear your barn apart to put in a G.L.F. Stable Cleaner." If your gutters are at least 14 inches wide, straight, and in good condition, anyone can do the small amount of concrete work necessary to prepare your stable for the cleaner.

The G.L.F. Stable Cleaner is delivered assembled and ready to use. The cows can stay

right in the barn while it's installed! There are no chains, tracks, paddles, gears or any kind of metal in the gutter. A flat belt especially fabricated to resist acids and withstand abrasive wear is all there is in the gutter.

### A Great Backsaver

Like any modern farming tool, the G.L.F. Stable Cleaner will pay for itself many times over. But to farmers who have used it, that's secondary. It's the saving of their backs they like.

The G.L.F. Stable Cleaner is now available through your G.L.F. service agency. Ask about it. Particularly if you're planning a new barn, or changes in your present one, plan to include the G.L.F. Stable Cleaner as part of your basic equipment.

Cooperative G.L.F. Exchange, Inc.,  
Ithaca, N. Y.

**SAVES HARD WORK.** "I can load a 90-bushel spreader and have the belt back in place in less than 5 minutes by just pushing a switch. It saves a lot of time, but to me its biggest value is in the hard work it saves. For labor-saving devices, I put the G.L.F. Stable Cleaner right next to the milking machine."—Gregory Thew, Campbell Hall, N.Y.

**BACKSAVER.** "It's a real backsaver and ideal for me due to the layout of my barn. Before I got it, I could clean my five gutters by shovel and carrier in an hour; but now I can clean out a load in exactly 6 minutes and 57 seconds by the clock."—Rex Burleigh, Snedekersville, Pa.

**BEST THING EVER.** "It's the best thing ever made to cut out heavy work in a dairy barn. I wish that all our cows were in the two rows so that we wouldn't have to use the old wheelbarrow and ramp for the other cows. We just pull a switch and the barn is clean in six minutes."—Arling Kiefer, Sr. & Jr., Bangor, Pa.

**NOT TIRED OUT.** "When I get done I am not all tired out. I can go out in the afternoon now and cut logs instead of lying down to get rested. If I could have had my gutter cleaner 20 years ago I'd be milking twice as many cows today, because I would have had the strength and the time."—Nelson Varcoe, Honesdale, Pa.

**LICKS MEAN JOB.** "We are not all tired out early in the day. I wouldn't take anything for my G.L.F. Cleaner if I couldn't buy another. It saves us the dirtiest job on the farm and you don't have to work your heart out with a shovel and wheelbarrow."—Clifford Baright, Poughkeepsie, N. Y.

# G.L.F. Stable Cleaner

**D**OES PASTURE irrigation pay? If a farmer has ample water and installs a system big enough to avoid high "per acre" costs, the answer is "Yes." It should net him extra dollars even in years of normal rainfall.

That's the conclusion I reached after talking to Northeast farmers with irrigation systems and studying surveys and experiments conducted all the way across the country from Maine to Washington.

Men who are using supplemental water on their farms (and there are more than 5,000 of them in the Northeast, not including New England) are for the most part enthusiastic about the results they are getting, and are recommending irrigation to their neighbors who have sufficient water. A recent survey in New York, New Jersey and Northern Pennsylvania indicates that between 700 and 800 more farmers in those areas plan to install irrigation systems.

No one disputes the value of irrigation for vegetable and small fruit crops. Farmers and experiment stations all over the country have reported phenomenal yields of these crops with irrigation. In the Northeast, yields are almost sure to be 50% higher even in years of normal rainfall. Many truck, potato, and small fruit farmers have paid for their irrigation equipment by saving their crops in one year of drouth.

As far as pasture irrigation is concerned, there have been no experiments or surveys in the Northeast over a long enough period or wide enough area to give us conclusive results. Therefore, my conclusion is based on the sum of results reported by Northeast farmers; yields obtained in a one-year test in Maine; the production comparison in a two-year test in Illinois; and cost figures for installation and operation from 14 Massachusetts farms and the average of 140 farms in the western part of the state of Washington.

The insurance value of an irrigation system during a drought year is no small consideration, but the prime object of adding more water when needed is to get higher yields at a low enough cost to warrant the outlay of a large sum of money for the system. I think some of the answers to this will be found in the condensed reports that follow.

### Maine

In a report by the Engineering and Agronomy Departments of the University of Maine experiment station covering just the 1950 season, an irrigated plot of mixed grasses and clover that was low in quality produced 1,387 pounds more milk per acre than did an adjacent plot that wasn't irrigated.

The test was made at Hampden, Maine, on a 6.4 acre plot of loam soil, medium in fertility. Irrigation was applied to half of the plot whenever tests showed the soil had less than 40% available moisture. This lack of moisture occurred 10 times in the period from June 1 to August 16. Each time, one inch of water was applied for a total of 10 inches added to the 8.21 inches of rainfall that fell on the plots between June 1 and September 14. On June 15, 7 cows were pastured on the irrigated, and 4 on the non-irrigated side. An attempt was made to match the cows out on both pieces of pasture as to their lactation periods and rate of production. They remained on pasture 29 days, until July 13, and were taken off because the forage had been grazed down quite short on both pastures. On August 7, 5 cows were put on the irrigated side and 2 on the non-irrigated side for 11 more days pasture. For both pasture periods the irrigated side produced 7,065 lbs. of milk and 258 cow days pasture, while the other side produced 2,691 lbs. of milk and 125 cow days pasture. This gave a milk production increase of 1,387 lbs. per acre due to irrigation.

On these same plots, forage growth was measured and cuttings were made three times during the summer: on July 3, August 3, and September 14. The irrigated section produced 10,636 lbs. per acre of green weight forage compared with 1,692 lbs. per acre on the non-irrigated section.

No cost figures accompanied the preliminary report on the Maine pasture test, but we do have some figures from the state of Washington, where costs were analyzed on 128 farms using sprinkler irrigation.

### Washington

On one farm studied by the State College of Washington the cost was \$13.21 per acre to apply a total of 10.4 inches of water on 25 acres. On this farm, electrical power was used, and labor costs were figured at 90¢ per hour.

In a study of the 128 irrigated farms it was found that 35 of them with 10 acres or less under irrigation had an investment of \$208 per acre; 51 with 10 to 30 acres had \$100 investment per acre; 30 with 30 to 50 acres had \$62 invested per acre, and 12 with more than 50 acres under irrigation had \$37 invested per acre. On 140 irrigated farms in Washington, the average cost of installation was \$1,860, including cost of drilling wells where a well was used as a source of irrigation water.

Commenting on the Washington irrigation, Ralph A. Loomis, agricultural economist, said: "The carrying capacity of sprinkler irrigated pasture was doubled. Increased pasture production resulted in an average of 2.5 additional months of available pasture per season. Hay production was increased by 1½ tons per acre on the average." (This jibes closely with the report of a New Hampshire farmer who added 6 inches of water in 4 lots to his hay land last year and reported that it increased production about 1½ tons of hay equivalent per acre, which he valued at \$60. He said this meant an increased return above costs of at least \$27.50 per acre.)

Many Washington farmers reported that they were able to liquidate their equipment after two years' use of irrigation. Similar claims are made by some Northeast farmers. For instance, one grower near Taunton, Massachusetts, last year irrigated 150 acres of alfalfa and, because of the irrigation, was able to get an extra cutting of close to 100 tons which he didn't need and sold at from \$40 to \$50 a ton. The irrigation investment for 150 acres was \$7,200.

### Illinois

Of perhaps better comparative value to Northeast farmers are results of pasture irrigation tests in Southern Illinois, where the average annual rain-

Belt-driven pumps for front or rear tractor mounting are now available. Illustrated above is a Marlow pump on a Farmall tractor. Barnes Mfg. Company also makes pumps for use on the Farmall tractors.

fall of 45 inches is comparable to ours. Like Maine's, that test consisted of two tracts of land, but there each half was divided into 7 subplots receiving different soil treatments.

Both 5-acre fields were plowed in the fall, 1947, and three tons of limestone and half-ton of 32% rock phosphate applied per acre before seeding this grass mixture: 3 lbs. orchard grass, 3 lbs. alta fescue, 2 lbs. Kentucky bluegrass, 2 lbs. redtop, and 2 lbs. timothy. In the spring of 1948, 2 lbs. of ladino per acre were broadcast. The plot that gave the greatest increase due to irrigation—and which maintained the highest percentage of legume at the end of the year (32.5%)—was treated in both 1948 and 1949 with 3 tons of limestone, half-ton of rock phosphate, 500 lbs. 32% superphosphate, and 500 lbs. of 50% potash.

Twelve inches of water were used on the irrigated plots. The best plot yielded the first year 3,666 lbs. more dry matter than the adjacent plot with the same soil treatment but no irrigation. In 1949 it yielded 4,053 lbs. more dry matter than the non-irrigated plot. This plot yielded enough to have given an animal gain per year of 214½ lbs. more than the similarly treated plot without irrigation. The Illinois technicians who ran the tests concluded that:

"Both forage yields and animal gains have been significantly increased by irrigation.

"Irrigation helps keep ladino in the pasture mixtures.

"Soil treatment was as important as irrigation in increasing the yields, and a combination of the two gave maximum results.

"Irrigation may be profitable in years of normal rainfall where as few as three irrigations are required.

"Irrigation may take one of the biggest hazards out of determining carrying capacity of pastures from year to year."

### Points to Ponder

From the above sources and from several of the manufacturers of irrigation equipment come several basic recommendations for men who are thinking about using supplemental irrigation systems:

1. Of utmost importance is a water supply that you know will stand up during the dry season. It takes 27,143 gallons of water to put one inch on an acre. For example, if during the year you wanted to add six inches of water to a 10-acre field, you would need 1,628,580 gallons. With a nearby lake or river you will be safe enough. If you are going to depend on pond or well or small creek, you had better have a competent engineer study your supply before laying out a system.

2. Have a careful analysis made of your soil to determine just how much water it can take an hour without runoff or erosion. In Southern Illinois they found that they got best results when two inches of water were applied at a time, but not many soils on Northeast farms can take or need such heavy applications. Some farmers report that from ¼-inch to ½-inch is all they ever put on at one time. The type of soil has a direct bearing on the size, and therefore the cost of your installation. If you put ½-inch on at a time, the portable pipe could be moved oftener, and therefore water a much wider area than if you had to leave the pipe in one location for a whole day and night, or even longer.

3. The extra water during summertime definitely stimulates growth and therefore uses more of the fertility in the soil. Plan to use more lime and fertilizer per acre with irrigation, as it takes a combination of both more water and more plant food to get the maximum results.

4. In choosing the type system you are going to use, weigh carefully your labor situation. If labor is very tight in your area and it appears that it might continue to be that way, then it may well pay to put a little more money in your system so that it will cover more area at one time and therefore necessitate fewer moves. Most of the manufacturers today are making systems of aluminum pipe that are very light and easily moved. Many of them also design systems that permit moving several hundred feet of pipe, complete with sprinklers, without disassembling the line. With some you can tow the whole lateral line with a tractor. In one system, the lateral pipes and sprinklers can be rolled across the pasture on wheels. As a general rule, systems such as those using huge nozzles covering up to 3½ acres at once require a great deal more pressure but do save on labor.

5. All studies of costs of installation, including those made by the University of Massachusetts in 1949, show that the most economical installations are those that cover the larger acreages. For instance, one Massachusetts farm with 100 acres of irrigation had a cost for 4 inches of water of only

# Empire State Club Members Celebrate 25th Annual Congress

THE last week in June, 4-H Club members from all over New York State gathered at Cornell for the 25th State 4-H Club Congress. One of the happy events of the meeting was the return of W. J. Wright, who was State 4-H Club leader from 1918 to 1943, and Mrs. Wright.

On Friday evening Dean W. I. Myers of the State College of Agriculture presented to Professor Wright a citation in the form of a plaque calling attention to his great service to agriculture. Also, during the Congress, State Club Leader Albert Hooper presented him with a pin in recognition of his 25 years of 4-H Club Service. The presentation of this pin was to have been made at the National Club Congress, but Professor Wright was unable to attend.

Also recognized at the Congress were a number of men who have 20 or more years of service as County or 4-H Club Agents. These men together with years of service are:

- Harry L. Case, Chenango County (31)
- H. H. Tozier, Jr., Dutchess County (26)
- John D. Walker, Erie County (25)
- E. B. Fuller, Monroe County (29)
- E. G. Smith, Oneida County (28)
- Mrs. Dorothy Flint, Nassau County (28)
- Russell B. Ace, Livingston County (22)
- Paul W. Thayer, Albany County (22)
- Leon C. Pratt, Madison County (22)
- Robert A. Dyer, Columbia County (22)
- Bert J. Rogers, St. Lawrence County (21)
- Melvin J. Merton, Genesee County (21)
- George Burkhardt, Nassau County (20)

## 4-H Members Win Awards

On Wednesday evening, Sally B. Johnson of Chester, N. Y., and Everett W. Tennant of Smithville Flats, N. Y., were presented with American Agriculturist Achievement Awards by associate editor Hugh Cosline. For twenty years these awards have been offered to members of youth organizations, including Future Farmers, young Grangers, Young Cooperators, and, for a time, Boy Scouts on farms. The winners are chosen on the basis of their activities and leadership in organizations to which they belong. Also considered is the originality which young people show in overcoming ill luck and handicaps in their projects.

The congratulations of the staff of AMERICAN AGRICULTURIST go to these two young people and to others who have won or who will win this honor in 1951.

## Dance Contest

On Thursday evening 4-H delegates relaxed at a dance in the armory. The event of the evening was a square dance contest at which Miss Lois Ford and Willis Simpson of Orange County were named Champion 4-H Square Dancers of New York State. They each received a handsome engraved trophy presented by AMERICAN AGRICULTURIST, as did the second best couple in the state, Pam and Larry Bush, a brother-sister couple from Greene County.

Judged third were Martha Jane Kells and William Behling, Cayuga County; and right on their heels for fourth place were Jackie Darfner and Doug Warner of Washington County.

Judges who picked the four best

couples in the State Finals were Robert Child, Field Secretary of Rural Radio Foundation, and Mrs. Child; and James LaRock.

Other finalists competing at Cornell, and who were champions in the three districts of the 4-H Council, all received ribbons, presented by this farm paper. They were Betty Bortugno and George McQuale, Columbia County; Janet Clark and Sheldon Randall, Franklin County; Marjorie Mceeks and James Rice, Schuyler County; Edith Jordan of Herkimer County and Fred Shaver of Chenango County; Beth Meyer and Laurence McMinn, Yates County; Louisc Williams and Bob Brandall, Cattaraugus County; Janice Brown and Jerry Reynolds, Genesee County; and Charity Howland and Dale Green, Alleghany County.

The program of the Congress which lasted from Wednesday afternoon until Saturday morning was largely aimed at training in leadership. No one could attend the sessions and see the hundreds of attentive, intelligent faces without renewed confidence in the future.

— A. A. —

## MORE — WATER — GRASS — MILK

(Continued from Opposite Page)

\$11.39 per acre, but another farm with an 18-acre irrigated plot had a per acre cost of \$22.06. Oftentimes a little more or a little larger pipe, a little higher powered engine and pump will give you a system with much more coverage, but little more cost, thereby reducing substantially your per acre charges.

6. There are several factors that affect both installation and operation costs on a farm, in addition to the size of the installation; the distance from the water source to the fields to be irrigated; the elevation from the water to the field; the shape of the field itself; the number of inches of water desired for application at one time, which depends both on the type of soil and the type of crop to be grown; and the type of power desired for the system, such as electric, diesel, gasoline, or possibly from a farm tractor.

## Figures Available

After a survey of your situation, a trained engineer, either from an irrigation company or your state college, can make a complete recommendation covering the size and amount of pipe, the size of sprinklers, the capacity of the pump, and the horse power needed for your operation. The engineers know exactly what performance to expect from all different kinds of equipment. They can tell you within a few pennies how much it will cost you to put an inch of water on an acre. All the companies—and there are lots of them competing for irrigation business in the Northeast—have developed very simple systems with ingenious lightweight couplings and valves to speed the work in the field, and pumps and sprinklers or nozzles which will give exactly the performance they promise when their specifications are followed.

It seems that the biggest problem in irrigation is out in the field where men still aren't sure exactly how much water to apply and how often. I know of one man who didn't get the results he expected from his irrigation because he had an idea that one thorough soaking during the year was enough. Other men irrigate once every 10 or 14 days "whether they need it or not." One of the best rule-of-thumb systems for irrigating is that when rainfall is less than 2 inches in two weeks during the summer, turn on the water.

## WHY BUY MARLOW?...

MARLOW WATER WIZARD CENTRIFUGALS ARE YOUR BEST SPRINKLER IRRIGATION PUMP BUY BECAUSE --

1. Marlows are designed especially for irrigation.
2. Marlows are the only irrigation pumps delivered completely equipped.
3. Marlow makes the world's most complete line of sprinkler irrigation pumps.
4. Marlows are sold and serviced from coast to coast by leading irrigation equipment distributors.
5. Marlows are backed by over a quarter century of specialized experience in producing quality pumps.

No other pump offers all these advantages. If the question is sprinkler irrigation pumps, Marlow is the answer.

## Jacuzzi HORIZONTAL SPEEDI-PRIME

Provides SHALLOW or DEEP WELL Service...

The Jacuzzi Horizontal Speedi-Prime water system is easily converted from shallow well to deep well service by simple changing of the injector assembly. This feature is valuable in many areas where the water table is lowering. This pump is normally equipped with a mechanical seal which is leakproof and requires no adjustment. This Jacuzzi mechanical seal is of the cartridge type, easily replaceable in the field. This same type pump is available in the Vertical Speedi-Prime. It offers a choice of three water systems: Shallow well, Deep well with parallel pipe and Deep well with single pipe.

Other warranted Jacuzzi pumps include: Aquamat, Selective Stage Jet and the Ever-Prime Water System.

# Growing Pullets to Lay Eggs

By **L. E. WEAVER**

**O**NE evening recently, I was in the poultry house of Professor H. E. Botsford and saw a beautiful flock of big, vigorous White Leghorn pullets that began to lay less than a month previous and were already up to a production rate of 33 per cent. They were started as chicks last November and, of course, were not grown on range.

L. E. Weaver

With egg prices probably well past the low spot, it seems as though this flock should be a real income-producer for "Botsy." Perhaps it will contribute some concrete evidence in support of the Darrah-Kearl proposition that November may be the best time to start chicks for replacement pullets intended for market egg production. Not many people are starting chicks in October or November, but if it proves to be as good a bet as it sounds, a lot more will soon be doing it. Poultrymen are usually alert and willing to forsake the old routines for the new, often "just to see how it works out."

I didn't ask "Botsy" if his pullets had been vaccinated against Newcastle

disease or immunized for Infectious Bronchitis. Possibly neither of these troubles have bothered his flock in the past nor have been in the vicinity, in which case he probably would be taking less risk by doing nothing than by introducing these infections so close to his susceptible old stock. I am just trying to think of the changes in the management of the growing pullets that are brought about as a result of a radical change in the time of starting the new flock.

Red mites are not much of a problem in cold weather as a rule. Could they be forgotten entirely? I am quite sure that confinement rearing must bring some problems of inadequate ventilation, damp floors, and possibly feather picking, which are seldom met with in warm weather with open windows and wide range.

Because most pullets are started in the spring it may be helpful at this point to list the practices that a good management program includes as routine:

1. Provide plenty of fresh air at night. A range shelter is better than a brooder house as a rule, largely because it is more open. Your best pullets next fall (if the owls don't get them) are likely to be the ones that forsook the houses and roosted in the trees.
2. Provide shade if the pullets are fed on range. Chickens just won't stay out

## How to Keep the Hens Cool

**L**AYING HENS don't enjoy hot muggy weather any more than the rest of us do. On sultry days we can wear lighter clothes or almost none at all, and find breezier spots to do our sitting or working. But about all the poor hens can do is slow down in their eating, and consequently in their laying. They are stuck with their one coat of heat-retaining feathers, and no chance, as a rule, to go searching for a better hole. Furthermore, because of their natural stupidity, or perhaps it's instinct, they probably would still go back every night to the same old crowded roosts in the same stuffy house even if they were free to go into the apple trees outside. So it's up to us to do whatever can be done to protect the layers: from the discomforts of hot spells. If we fail to do it we risk losing many dozens of eggs, and even many hens through heat prostration.

The things that can be done are of two sorts; preventive measures that are done in advance, and emergency measures to give relief in times of particularly severe heat waves.

### Preventive Measures

Two preventive measures stand out above all others; fixing up the poultry house so that the heat of the sun is not absorbed and retained but is reflected away from the hens; and keeping windows and doors open so that air can move readily across the floor. These two measures require practically no time or attention after they have once been attended to. Take time to replace the regular door with a screen door at the same time you are putting the screens on your own residence. Take out or hook back the glass windows and tack up wire netting if you don't have wire-covered frames to put in.

It will take more time to change over the usual poultry house to increase its heat resistance. Next time you put on a new roof let it be something light in color if possible. Bright metal roofs are cool beneath—believe it or not—because they reflect and do not absorb the heat. About the hottest attics on

a sunny day are the ones beneath black roofs.

For most poultry keepers, however, it will be easier and just about as effective to put in some insulating material as to change the roof. A tight ceiling of material that won't sag and pull away from the nails when covered to a depth of 3 or 4 inches with shavings (when settled) sawdust, rock wool or similar material will go a long way toward keeping the heat from getting into the room beneath, even though the roof is dark in color. If you insulate the sidewalls in a similar way you will make the place still more bearable for your hens on hot days.

One other long-time measure is to install an exhaust fan in the end of the pen away from prevailing winter winds, and near the ceiling. It will help keep the pen dry next winter as well as to take out some of the hot air on days when no breeze is stirring outside.

### Emergency Measures

Hens, like humans, seem to crave lots of cold water on hot days. It would not be practical to carry ice water to them, but it has been shown by experiments that it does pay to put extra water containers in the laying pens, and to refill them often.

If the hens are not eating as much as usual, one or two small feedings of wet mash or pellets may help to keep up their feed intake.

Where the flock is small it may be possible to let the hens go outside where it may be less uncomfortable in the shade of trees or hedges than it is inside.

In extreme cases where hens are likely to die of heat prostration in the nests, it will lower the indoor temperature several degrees to spray the litter and sidewalls liberally with water. If no water is available under pressure a dipper and bucket will do the trick.

Finally, when you find a hen that has passed out or is ready to do so, immerse her up to her neck in cold water and then lay her in the shade. The evaporating water does a cooling job that usually will revive the victim.

in the hot sun, not even to eat or drink. That's one reason they grow faster inside where they eat in some comfort, and therefore eat more.

3. Keep the shelters or brooder houses as cool as possible. Let the breeze blow through by opening doors and windows at opposite sides. Avoid dark-colored roofing, which absorbs heat. When possible, use bright metal roofing, which reflects the sun's rays away from the building.

4. Remember that red mites come with hot weather. They multiply at a terrific rate, and they can be damaging your pullets and you won't suspect it until it may be too late. Finally, remember that it is an easy job to keep the mites out in the first place. Just use a good mite killer on the roosts before you move the pullets to the shelters.

5. Water is an even more essential part of the pullets' ration than feed. It costs so little. Never let the water supply fail for even a few hours.

6. Protect yourself against heavy losses from disease in the flock next winter by vaccinating and immunizing the pullets before they are starting to get ready to lay, and therefore are not harmed by these treatments. Ask your county agent about the program for your section.

7. Follow an accepted schedule of feeding. Different customs are advocated by different companies, but apparently all will produce good pullets if you feed a given brand as it is designed to be fed.

**BABCOCK'S  
HEALTHY  
CHICKS**

**MAKE GREAT LAYERS**

A the 1950 Storrs Conn. Egg Laying Test our White Leghorns won first all breeds, with 3899 eggs and 4124.5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the all-time World's record for all breeds. All tests won in 1944-45.

**WE HATCH THE YEAR ROUND**  
White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks. We own two hatcheries with 600,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

## From the Editor's MAILBAG

### MORE MEAT CHICKENS

THOSE of us who have been closely associated with the Chicken-of-Tomorrow program since its beginning are naturally quite proud of its accomplishments. The 1951 finals, as you know, were held in Fayetteville, Ark., June 11-16.

In the last five years the growing time of meat chickens has been decreased from 12 to 14 weeks for 2½-pound chickens to 9 to 10 weeks for three- or four-pound chickens. Feed consumption per pound of chicken has also been reduced from four to less than three pounds. All of this, coupled with the fact that the idea was spread clear across the land, has resulted in an agricultural industry that is producing meat chickens at the rate of 800,000,000 for 1951, as compared with 616,000,000 in 1950. In 1940, the production of chickens for meat purposes was 123,696,000.—Hudson S. Robbins, Secretary CHICKEN-OF-TOMORROW Committee.

—A.A.—

### "CHUCKS"

I read the item on the editorial page about "Those Pesky Chucks" with interest. I am a farmer and have had to fight woodchucks for a good many years.

For the past fifteen years I have used the method of soaking burlap sacks in gasoline and then putting one down each woodchuck's hole. When you do this, be sure he is in there; then block the hole. I never set the sack on fire, as fire and gasoline are dangerous; and I find that without setting it afire, it works just as well. It certainly kills them and it has worked better than any method I have ever used.—G.M. Burrill, Putnam, Conn.

—A.A.—

### STILL OLDER!

IN "Freedom Is the Theme" in the February 4 issue, you speak of the New York State Agricultural Society which was organized in 1832 as probably being the oldest farm organization in America. I thought you would be interested in the following:

The Essex Agricultural Society, with offices at Topsfield, Massachusetts, was organized on June 12, 1818. This can be verified by contacting the Secretary, Ellery Metcalf, c/o Essex Agricultural School, Hathorne, Mass. I am a life member of this organization and it is the oldest that I know of.

—W. L. Bushby, LeRoy, N. Y.

—A.A.—

Dear "Doc" Roberts:

For many moons I have enjoyed the observations that you make after analyzing conditions as you see them. I freely admit that I was one who approved the 18th Amendment hoping that it would do some good, but one thing we should have learned from that experience was that our country covers a big territory and the job of policing is too big.

But the urge now seems to be to enact more laws to provide more hand-outs and more jobs, requiring more legislation, all of which creates a bigger job of policing at every turn.

—Fred Lyman, Talcottville, Conn.

—A.A.—

### WEEDING GEES

Dear Mr. John Babcock:

In reading your Sunnygables Notes in "Kernels, Screenings & Chaff," I noticed you inquired about geese as weeders. We had a peculiar grass

which came up like a carpet (annual) and many others. We pastured geese on a strawberry field and they destroyed every bit of grass, but smartweed, ragweed and pigweed grew high as my head. The geese would starve before they'd touch a weed or a strawberry. If the bed is too small, they will pull off the leaves of the plants when they rest, so it is a good idea to provide water and shade at least 20 feet from the plants.

We used ducks too, and they took nothing but grass. Incidentally, ducks are good in asparagus plantings. They eat the grass and carefully inspect each stalk for the beetles and grubs which they love. They get so "darned" excited when they find a real buggy one, just as we do.—Mrs. G. F. Bergeron, 1318 Granby Rd., Chicopee Falls, Mass.

—A.A.—

### ANOTHER HANDICAPPED FARMER

I could not help but write you when I read "Farming with One Arm" by Gerald Chapin. Mr. Chapin is a man who deserves all the credit you gave him, as it is very hard for a man to do things with only one arm, especially when it is his right arm that is gone.

I can sympathize with him, as I am a farmer without my left arm which

was amputated three inches below the shoulder. I cannot use a hook but I have a harness which helps to take the place of my hand. I believe I am the only one-armed man who can wheel a full load of manure in a common wheelbarrow. I drive a tractor, drive a team, chop wood and do all kinds of work. I can even shoe horses. I was left-handed all my life until I had an accident in 1945, just two days before my 40th birthday. I had to learn to write with my right hand which I cannot do very well yet.—J. E. Tedford, Essex, N. Y.

EDITOR'S NOTE: In the story "Farming with One Arm" we indicated that Gerald Chapin's father was Oscar Chapin, one-time County Agent. That was incorrect. Gerald's father is Walter, a brother of Oscar.

### Boys will be boys... that's why they like to watch us work and ask us questions

• And we've got the answers—because we've learned a lot about the telephone since it was invented 75 years ago.

Every telephone man uses that knowledge on the job. He works with tools that experience built. He puts in telephone materials and equipment that experience designed. Construction goes faster, lasts longer; service has improved steadily over the years.

There's more and better rural telephone service here in America than anywhere else in the world, and we're keeping right on extending and improving it in Bell rural areas.

The farm telephone has a big job to do, as it helps meet the needs of the national emergency.

BELL TELEPHONE SYSTEM

**ADVERTISING RATES**—10 cents per word, initial or group of numerals. Example, J. S. Jones, 100 Main Rd., Anywhere, N. Y. Phone Anywhere 15R24 counts as 12 words. Minimum \$1.00. Send check or money order to AMERICAN AGRICULTURIST, P. O. Box 514, ITHACA, N. Y. Advance payment is required.

**YOUNG PRODUCTS**

Dept. 8-F, 2605 Elmhurst, Detroit 4, Mich.

By J. F. "Doc" ROBERTS

**A** REVIEW of the livestock situation of the last two weeks gives a perfect picture of just how bureaucratic "controls" raise prices of the very essentials they are supposed to lower.

The last week in June we had control agitation in Congress, i.e., reports of no more rollbacks, no more quotas, and even the grand possibility that pricemaking would be returned to the people themselves. This so frightened black market operators and law evaders that they were afraid to stock up heavily, and livestock was lower.

Ever since this DiSalle group began getting power, our livestock markets have been stimulated by new buyers; therefore, prices have been getting higher. But the feeling in the legal livestock industry still persists that legislators and bureaucrats will soon see that even "talk of controls" is forcing livestock prices up, and that every time they actually put on a "control," prices will just rise again.

**How It Works**

How could this happen? Better, why does this always happen?

First, everyone knows—and our legislators should know — that livestock and meat controls cannot be enforced.

Second, black marketeers know it also and jump into the market for millions of "slippery bucks" that are sure to be available to them. These opportunities increase at every new order "tightening controls." "Tightening" makes it harder for the legitimate packer to compete with the illegitimate, for it only tightens up on the legitimate packer. The illegitimate never has, or never will, operate under any law.

Third, every animal that black marketeers buy makes one less for the honest man to buy, until (as happened again this time) the honest packer (whether big or little) can only get enough animals to operate his plant a day or two a week.

Fourth, soon the black market boys

are buying most of the livestock available. Then, they can control prices and control the supply to the consumer as well. Thus the public pays higher and higher prices or goes without.

Now, we have the proof of all this. Congress began to talk and vote as if they would reverse bureaucratic controls and laws regulating price. No one knows better than the black market boys that unless there are laws stifling the production of their honest competitors, they cannot compete. Therefore, they let up on their buying and, naturally, prices come down on all livestock. With controls somewhat restricted, the public is again having more to say as to what they can and will pay legitimately, but this will continue only if the bureaucrats keep hands off or are forced to do so by Congress.

You and I have the opportunity, perhaps our last, to return our country to the people. When they passed the "watched down" extension of the price control law, Congress allowed us thirty days (over half of which are gone) in which to get word to them as to whether or not we want to turn ourselves over to bureaucrats and black marketeers. The opportunity is here now; let your Congressman know by letter what you want.

P.S. Let's give Congress credit for voting no more rollbacks in food prices. Livestock is on a sound footing, including dairy and replacement stock. Do not sacrifice any animal but keep it until it is ready to go. Wool is in the shortest supply both here and over the world that it has been in years. Wool is excellent property and in a position to bring its true value by winter.

— A.A. —

**MAINE MAN HEADS U. S. HOLSTEIN GROUP**

Harold J. Shaw of Sanford, Maine, was elected president of the Holstein-Friesian Association of America at the 66th Annual Convention of the Association in Des Moines, Iowa, last month.

Other officers are J. Homer Remsburg, Middletown, Maryland, vice-president; E. M. Wright, Waterloo, Iowa, Scott Meyer, Hannibal, Missouri; Harvey Nelson, Union Grove, Wisconsin, and M. R. Moomaw, Canton, Ohio, directors.

Approximately 1,500 attended the convention sale which was topped by Crescent Beauty Lady Gloria 2D, which brought \$5,200. Altogether 76 registered Holsteins brought a total of \$99,450 to average \$1,308.

The delegates approved the long-debated Selective Registration Plan for inauguration January 1, 1953. Through the plan, bull calves will be recognized in their registration certificates if their ancestors meet certain requirements of achievement in body conformation and milk production.

**POTATO FIELD DAY AUGUST 9**

**O**VER the years the Empire State Potato Field Day has grown into one of the big farm events of the year in the Empire State. This year well over 10,000 potato growers are expected when the event occurs August 9 on the Wells-Aldrich farm in Sauquoit, Oneida County, N. Y.

As usual, there will be a full program including demonstration plots where potato diseases and insects can be seen and where the effect of different practices can be observed. Throughout the day potato-growing machinery including planters, diggers, cultivators, etc., will be operating so that visitors can observe their good points and ask questions if they so desire.

An entirely new feature will be a potato peeling contest for farm women. It will be limited to 50 entries (first come, first served) and the contest will run continuously from 9 to 12 noon. Each contestant is asked to bring her own paring knife. The scoring will be based on the amount of waste in the peels and defects that remain in the potatoes after peeling. The time required will also be considered in choosing winners.

**"It's hard to beat a HARDER WOOD STAVE SILO..."**

That's what thousands of satisfied Harder owners have told us. And that's why so many farmers buy their second, third and even fourth Wood Stave Silos from Harder.

For year after year dependability there's no Silo with a better service record than the famous, trouble-free, Harder WOOD Stave Silo.

If you prefer concrete then the popular "red and white top" Harder Concrete Stave Silo will prove a profitable investment. It's the talk of farmers everywhere.

Write or phone today for descriptive literature.

CITY.....ZONE.....STATE.....

HERE's a wonderful feeling of satisfaction and security in having a well-filled jam and jelly closet—and it's easy to keep up with the procession of fruits from spring to autumn if you take them as they come and do not try to do too much at any one time. Plan to have a variety of jams and jellies, and then use them in every way possible.

Red jam makes a luscious filling for cake or topping for ice cream; jelly spread on bread or in sandwiches doubles the youngsters' consumption of the staff of life; a bit of red jelly a-top a serving of custard or pudding adds color and flavor; jelly or conserve added to baked apples the last five minutes of cooking increases their prestige. You can mix jelly with mayonnaise or whipped cream for fruit salads; you can make the "crowd" or the "gang" happy with doughnuts and grape conserve; you can enhance any meal by putting a beautiful, sparkling jelly on the table, to go with the hot biscuits or the meat. And what would breakfast be without that last piece of buttered toast with jam or marmalade?

When making jams and jellies, keep in mind their suitability as Christmas gifts, bazaar contributions, roadside stand items, and state and county fair entries. Somebody's going to win premiums on their jams and jellies at fairs this fall—and it might as well be you!

### How to Make Jam

Jam may be made from whole, cut or pulped fruit. The prepared fruit is cooked with sugar until it is soft and the juice is thick. The finished product may be lumpy with pieces of fruit, or smooth like the fruit pulp, but the fruit does not remain whole.

Use only fresh fruit, free from decay or discoloration. Wash, remove stems or blossom ends; peel and core hard fruits, or remove pits. Slice or chop as necessary.

Place clean jars and covers upside down in a pan of water and bring the water to a boil. Keep them in the water until you are ready to fill them with jam. Each 4 cups of prepared fruit will make about one quart of jam. The paraffin may be put in a tin or small saucepan and kept melted in the pan with the jars.

To each cup of prepared fruit add  $\frac{3}{4}$  cup of sugar. Cooking in small quantities gives a better product; not over 4 cups of fruit and 3 cups of sugar. Use a saucepan large enough not to boil over.

Heat the fruit and sugar slowly, stir-

by  
**ANNA ROGERS WILLMAN**

# PASS the JELLY, MOM!

ring constantly until the sugar is dissolved. Bring the mixture to a boil, and boil rapidly until it is thick.

Take the jam off the stove, cover and let stand for two minutes. Skim if necessary, stir the jam well, pour into hot jars and seal with a thin layer of paraffin. After the jam is cold, pour on more paraffin, making sure there is a good seal with the sides of the jar. Wash the jars, put on the covers, label and store in a dry, dark, cool place.

Fruits suitable for making jams are apples, apricots, blackberries, blueberries, cherries, currants, elderberries, gooseberries, peaches, pears, raspberries, and strawberries.

### How to Make Jelly

Jelly can be made from fruit juices which contain pectin, or from others by using commercial pectins.

Fruits which have enough pectin are: apples, crab apples, blackberries, currants, cranberries, gooseberries, grapes, quinces and raspberries.

Fruits which do not have enough pectin are: apricots, blueberries, cherries, elderberries, peaches, pears and strawberries.

Fruit of good flavor and color, and which is no more than just ripe, will make the best jelly. Use only fresh fruit, free from decay or discoloration. Wash the fruit, and remove any stems

WE are twice blessed by Nature's generous offering of fruits from spring to fall—first when we eat them fresh, and second when we find again their fresh fruit flavors in delicious jams and jellies.

or blossom ends. Slice or quarter hard fruits such as apples or quinces, but do not peel or core them.

Put the fruit in a large kettle; crush soft fruit, add water to hard fruit. Bring to a boil, and boil rapidly for 10 min-

### GRAPE JAM

Wash the grapes, remove the stems, and press the pulp from the skins. Cook the pulp and put it through a sieve to remove the seeds. Add the skins to the pulp, measure this mixture and add two-thirds as much sugar. Cook until the skins are tender, and proceed as in the general directions for making jam.

### TOMATO AND APPLE JAM

1 lemon, thinly sliced and cut in small pieces  
 $\frac{1}{4}$  cup water  
1 pint chopped tomatoes  
1 pint diced apples  
3 cups sugar

Cook the lemon in the water until tender. Combine all ingredients and proceed as in general directions for making jam. Yield: 6 glasses.

### SPICED PEACH JAM

Proceed as directed in "Peach Jam" recipe, but add  $\frac{1}{2}$  to 1 teaspoon each cinnamon, cloves, and allspice, or any desired combination of spices, to peaches before cooking.

### PEACH JAM

4 cups prepared fruit  
 $\frac{1}{4}$  cup lemon juice  
 $7\frac{1}{2}$  cups sugar  
1 bottle fruit pectin

To prepare the fruit. Peel and pit about 3 pounds soft ripe peaches. Grind. Measure 4 cups into a very large saucepan. Squeeze the juice from 2 medium-sized lemons. Measure  $\frac{1}{4}$  cup juice into saucepan with peaches.

To make the jam. Add sugar to fruit in saucepan and mix well. Place over high heat, bring to a full rolling boil

utes or until the fruit is soft. Strain through a wet jelly bag, or several thicknesses of cheesecloth.

The amount of sugar to use depends upon the amount of pectin. (A gel-meter is a special glass tube used to

make this test. Follow the instructions which come with the tube.) Generally  $\frac{3}{4}$  cup of sugar to each cup of juice makes a good jelly.

Measure not more than 4 cups of juice into a large kettle, add 3 cups of sugar. Heat slowly, stirring constantly until the sugar is dissolved. Bring the mixture to a boil, and boil rapidly until it gives a sheeting test, or a temperature test.

**Sheeting test:** Take up some of the hot mixture and let it fall from the side of the spoon. If the juice forms drops which run together or sheet from the spoon, the jelly is done.

**Temperature test:** Put a dairy or candy thermometer into boiling water and note the temperature. Add 7 to this temperature and you have the temperature at which the jelly should be done.

The jelly glasses should be sterilized in hot water (see directions under jam).

Remove the jelly from the stove, skim if necessary. Pour the jelly into the hot glasses, and seal it with a thin layer of melted paraffin. After the jelly is cold, pour on more paraffin, and while it is liquid slant the glass and turn it around so that the paraffin makes a good seal with the sides of the glass. Wash the glasses and put on the covers, label and store in a dry, dark, cool place.

and boil hard 1 minute, stirring constantly. Remove from heat and at once stir in 1 bottle of fruit pectin. Then stir and skim by turns 5 minutes to cool slightly, to prevent floating fruit. Ladle quickly into glasses. Paraffin at once, and again when cold, as in general directions. Makes about 11 six-ounce glasses.

### QUINCE JELLY

For extracting the juice:

3 quarts of chopped quinces  
6 cups water

For making the jelly:

4 cups of juice  
3 cups sugar

Proceed as in general directions for making jelly. Yield: 6 jelly glasses.

### BLACKBERRY JELLY

For extracting the juice:

5 quarts berries  
1 cup water if fruit is firm

For making the jelly:

4 cups juice  
4 cups sugar

Proceed as in general directions for making jelly. Yield: 6 jelly glasses.

### APPLE OR CRAB APPLE JELLY

For extracting the juice:

3 quarts of quartered apples  
3 cups water

For making the jelly:

4 cups juice  
3 to 4 cups sugar

Proceed as in general directions for making jelly. Yield: 6 glasses.

BIG NEWS!**

# CHEER

Procter & Gamble's  
**NEWEST**  
Washday Marvel

No matter what soap you're now using—  
**cheer** guarantees a cleaner, whiter wash!

"Clothes dry so fresh  
and sweet-smelling  
you'll want to hug them!"

Try **cheer** once...  
and you'll **cheer** forever!

CHEER is the trade-mark of a special all-purpose detergent made by PROCTER & GAMBLE.

Here's your chance to try something that's *better* than *any* soap—  
new CHEER!

There's probably nothing wrong with the soap you're using now. But this new washday marvel is *guaranteed* to get clothes cleaner and whiter than *any* soap.

Try it just once, and discover *at every washing step* how new CHEER proves its guarantee!

**Next washday you be the judge!**

- 1. Prove Cheer's guarantee—IN YOUR WASHING MACHINE!**  
See how fast the *thick, long-lasting* suds leap up in hardest water! See how CHEER works out even tough greasy dirt. And with all its *extra* washing power, CHEER is *safe* for colored washables, *gentle* on your hands.
- 2. Prove Cheer's guarantee—ON YOUR WASHLINE!**  
After you rinse and wring out, your CHEER-washed clothes will dry sparkling clean and oh-so-white! No bleaching, bluing, or water-softeners necessary.
- 3. Prove Cheer's guarantee—ON YOUR IRONING BOARD!**  
CHEER leaves no soap film to yellow under the iron's heat. Yes, CHEER-washed clothes iron beautifully, end up cleaner, whiter than *any* soap will get them—or your money back.

Get CHEER in the convenient Giant Economy Size package

**P.S. Wonderful  
for NO-RINSE  
washing, too!**

If you wash without rinsing, no washing product on earth will give you a cleaner wash than CHEER. CHEER will give you the cleanest no-rinse wash it's possible to get.

## Salad Dressings Made to 'Fit' the Salad!

By ANNA ROGERS WILLMAN

**M**ORE than any other time of the year, summer time is salad time. Use a hearty meat or egg salad as a main dish on a hot night, and pep up any meal with fresh salad greens. Fruit salad makes a most acceptable dessert or party refreshments. The salad dressing is of course all-important, and should "fit" the salad you are serving. Here are four good ones to keep on file:

### DRESSING FOR WILTED GREENS

- 2 tablespoons vinegar
- 2 tablespoons drippings or salad oil
- ½ teaspoon salt
- 1 teaspoon grated onion
- 2 quarts cleaned, coarsely cut greens (lettuce, spinach or a mixture of greens)

Mix all ingredients in a saucepan and heat. Add the greens, and turn them over and over until some of the crispness is gone and each leaf is well seasoned. Yield: 6 servings.

### EGG SALAD DRESSING

- 1 clove garlic
- 4 hard cooked eggs
- 1 tablespoon sugar
- ½ cup sour cream
- ¼ cup vinegar
- ¼ teaspoon dry mustard
- 1 teaspoon salt

Rub a bowl with a cut clove of garlic. Separate the egg yolks from the whites. Thoroughly cream the egg yolks and sugar, then add the sour cream, stirring constantly. Chop the egg whites and add to the mixture. Add the remaining ingredients and mix well.

### SOUR CREAM OR EVAPORATED MILK DRESSING

- ¼ cup sugar
- ½ teaspoon salt
- ½ cup vinegar
- ½ cup sour cream, or evaporated milk

Add the sugar and salt to the vinegar and stir until dissolved. Add the cream or milk and stir until the mixture thickens. Pour over salad and blend with a fork. This dressing is especially good on leaf lettuce.

### COOKED SALAD DRESSING

- Plain Dressing:
- 2 tablespoons flour
  - ¼ cup sugar
  - 1 teaspoon salt
  - ¼ teaspoon mustard
  - ¾ cup water
  - ¼ cup mild vinegar
  - 1 egg, or 2 egg yolks, slightly beaten

## COMRADES

By Edith Shaw Butler

The pony and the child were friends,  
They roamed the country fields and lanes  
In that enchantment childhood lends:  
Two freedom-loving scatterbrains.  
Unmindful of the time or weather,  
As joyous as the lark that sings,  
They shared the little roads together,  
They stopped for brookside dallings  
And picked the flowers growing wild. . . .  
The shaggy pony and the child.

- 2 tablespoons butter
- Sweet Dressing:
- 3 tablespoons flour
- ½ cup sugar
- 1 teaspoon salt
- ¼ teaspoon mustard
- ½ cup water
- ¼ cup mild vinegar
- 1 egg, or 2 egg yolks, slightly beaten
- 2 tablespoons butter

Mix the dry ingredients; combine with the water and cook over direct heat until the mixture thickens slightly. Place over hot water and continue cooking for 5 minutes. Add the vinegar and mix. Add about half the hot mixture to the egg, stirring constantly. Return the mixture to the double boiler, and continue cooking until thick; stir to prevent lumping. Add the butter and blend. Remove from the heat and cool. Yield: 1½ cups.

The plain dressing is very good for potato or cabbage salad. Use the sweet dressing on fruit salads.

— A.A. —

## "Fun-Itis"

By LOUISE PRICE BELL

**I**F you know someone who is sick, you will discover that games, books, and puzzles can fill many a quiet hour. Color books and crayons are fun for children, and even an adult may find much enjoyment with colored chalk. It blends like water-colors and may be preserved by spraying it with plastic or shellac if a masterpiece is developed.

If a sick child is not allowed visitors, receiving his own mail is the next best thing. Buy enough post cards so that you can send one every day, and he will look for the mailman's morning visit.

When sending a letter to a sick child, he will be kept busy for a few minutes and enjoy the suspense if you make the note into a puzzle. Do this by writing it on cardboard or heavy paper and cutting it into irregular pieces.

A back-rest makes a sick member of the family a little more comfortable, and you can make him one by slipping his pillow through a wire hanger and hanging it on the headboard behind him. You may also add to his comfort by changing the pillow slips frequently—twice a day if possible.

Since children love to watch things grow, a sick child should have his own bedside garden. You can make one for him if you put several thicknesses of paper towels around the inside of a goldfish bowl, dampen the paper, then put bean or sunflower seeds between the paper and glass. In a mere matter of days there will be little sprouts clearly visible. Until these seeds come up, however, you can use trick flowers to keep the child entertained. You can buy them in most novelty stores, and when they are put in a glass of water, they will blossom into lovely shapes that will surprise even you.

For Ten State Winners

For 53 County Winners

## More Prizes For Cake Bakers

**N**EW YORK State bakers will have baked 5,000 chocolate cakes by the time the finals of the AMERICAN AGRICULTURIST-New York State Grange baking contest take place at State Grange this fall. The 53 county winners will compete in the finals.

The "Grand" and cash prizes and many of the merchandise prizes were listed on these pages last month but they were not all! From the Walter Baker Division of the General Foods Corporation, each of the ten high state winners will get a wicker hat box, 9 inches high, filled with: several packages each of Baker's Breakfast Cocoa;

8-oz. boxes 4-in-1 instant Sweet Cocoa Mix; Baker's Dot Chocolate especially for candy making; Baker's Unsweetened Chocolate for quality chocolate cookery; Baker's Semi-Sweet Chocolate Chips; Baker's German Sweet Chocolate; and one Baker's Favorite Chocolate Recipes handbook.

In addition to these 10 state awards, the Walter Baker Division will give to each of the 53 county winners a baking kit comprised of one Baker's Favorite Chocolate Recipes handbook; one Learn To Bake booklet; one set measuring spoons; one rubber scraper; one 8x8x2-inch cake pan; and one cookie sheet.

## Today in Aunt Janet's Garden

### She Roots Cuttings

**M**Y experience with rooting cuttings from the overgrown window plants met with varying degrees of success when I moved them in late spring. After keeping the cuttings in water for 3 or 4 hours, I put them into 2- or 3-inch fiber pots containing soil mixed with peat moss and sand. The geranium, coleus, and "beefsteak plant" (I still do not know its proper name) went right along without wilting and with few losses. But the everblooming and rose begonias did not take hold in the soil mixture. I have no trouble starting them in water and hereafter shall stick to that method.

I have just separated the baby plants resulting from a rooted African violet leaf with stem attached. Still another leaf has started small plants after about 6 months of waiting. I have just started a leaf, with stem, of Bronze Girl and hope that it will behave as well as the other two, even though it does take 6 months!

### Got A Good Start

The spurt which resulted from sunny warm weather in April and early May brought everything along a week or two earlier than usual. Normally we are pleased if the old-fashioned red peony is in flower by Decoration Day, but this year it not only made it but had plenty of company.

Lilacs and dogwood had fine extra large blossoms, but fewer of them. Foliage on trees and shrubs is very lush. On the Mayflowering viburnums (after flowering) I did a thorough job of pruning, mostly in order to reduce the leaves which were almost matted due to not pruning last year. This shrub gets black spot in hot humid weather and it needs good ventilation; hence my activities with the pruning shears. A spray of Bordeaux mixture will control the black spot; it is interesting to know that this viburnum will not tolerate sulphur.

A summer-flowering bulb that blooms year after year for me is the glloxinia. It is in a pot on our enclosed porch. The ruby throat with white frill is very exotic, yet it fades into insignificance beside some of the newer hybrids. I have to admit that I have not been too successful with the latter,

but I shall keep on trying.

The amaryllises and the cyclamen are parked between the shrubbery and the house in a light spot, but out of the battering wind. I shall try again to bring an old cyclamen into flower, although last fall's effort to do so was a flop. The greenhouse men say that cyclamen requires a cool house—which most homes are not. The amaryllises will get more 5-10-5 fertilizer scratched in around the edge of the pots. This is the time of year when they are forming next year's flowers.

### Look Ahead

Any gardener, even of the window variety, must look forward a season or more. Even if you have nothing more than a few flowering annuals in pots in front of a sunny window, they need to be planned for in advance. Potting up a plant which has flowered for some time is not satisfactory. It is far better to take a vigorous seedling and accustom it to pot conditions before really cold weather.

The seedlings may be obtained from self-sown ones in the garden or from seeds sown in flats or open garden in late summer. Ageratum, marigolds, petunias, all of the low-growing varieties, are annuals which easily adapt themselves to window gardening.

Petunias also are easily rooted from cuttings, so if you have some favorites, cut off 4 or 5 inches, remove flower buds and all but 4 or 5 leaves at the tips. Insert stems at least two nodes deep in sand or a mixture of sand and peatmoss. Water well. Keep moist but not soaked. Shade lightly at first, then gradually give full sun. Started in late summer they provide mid-winter bloom.

— A. A. —

### LITTLE ROAD

By Julia L. Wallace

A little road runs down a hill,  
All lined with firs and beeches,  
And singing birds nest in their boughs,  
So safe alike from sun and snows,  
And rocked by every wind that blows,  
While Heaven their carol reaches.

But you must walk along this road  
To know its charms at last:  
The tiny flowers beneath the leaves,  
The fragile web the spider weaves,  
The mourning dove that sits and grieves,  
You'll miss if you rush past.

### GIFTS for BABY

You can make all of these pretty things for one baby — or divide them among several! The instruction leaflet gives directions for making two crocheted sacques with matching bonnets, a lovely knitted kimono, and a dainty little crocheted bib. They are all easy to make and sure to please. Write for Baby Clothes Leaflet C-46 and enclose 3 cents in coin. Address Needlework Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Please write name and address plainly.

LOOK YEARS AHEAD...and buy a

# Speed Queen

the washer with a  
**trouble-free**  
future!

Mrs. Robert Moffitt of North Dakota writes as follows:

"My Speed Queen washer, which I use every week, is going on its 17th year. Three years ago I entered a jingle contest and won a nationally advertised automatic washer. I was thrilled beyond words! However, after a few weeks of using the new automatic and watching my water bill, oil bill, and soap bill climb — with washing results far less satisfactory than before, I set about to remedy the situation. I now use my automatic for one load of clothes and then run the hot water into my Speed Queen. I continue with my Speed Queen for the rest of the wash. I never hesitate to recommend my 17-year-old Speed Queen because it washes cleaner and is much more economical."

Go to your local Speed Queen dealer and ask for a free demonstration or write the Speed Queen Corp., Ripon, Wis. for literature.

## WHAT'S GONE BEFORE

Immediately after his marriage to Ann Clinton, Mark Wilson leaves to join Lincoln's volunteers. His brother, Charlie, and his father, George Wilson, follow him into the Army; also Ann's father, Fred Clinton. Ann receives news that Mark has been killed in the Battle of Fredericksburg, and in her intense grief becomes indifferent to everything. Her attitude hurts Nancy Wilson, Mark's mother, although she understands the cause. The mortgage on the Clinton farm is held by Henry Bain, a well-to-do farmer, who has always wanted to marry Ann. In her grief, Bain manages to convince her that the best thing she can do to save the farm and help her mother is to marry him, which she finally does. After the marriage Ann finds herself at variance with her husband in many ways, but particularly about his attitude to the war.

## CHAPTER XXIII

IN the days that followed Ann's defiance of Henry and her announcement that she intended to serve the Union cause in every way within her means and power, they went about their respective tasks with little said between them. But Ann thought she noticed an attitude of increased respect on the part of her husband, even to the point of his showing a little more consideration for her mother.

"Maybe that's all he needs," she thought, hopefully. "He's always had his own way, and it may be good for him to find out that other people have their rights, too. Maybe he'll show more respect for those rights."

So gradually Ann relaxed her formal manner with Henry and was more friendly. Then something strange happened. One night after they were asleep, they were startled by a loud knocking on the front door. Henry got up hurriedly, lit the light, pulled on his pants, and went downstairs. Listening intently Ann could hear voices apparently raised in angry argument, but couldn't make out what was said. After a while Henry came back, blew out the light, climbed into bed and started to shiver violently. Feeling sorry for him, Ann broke her rule of not interfering, turned to put a comforting arm over him and asked him what was the matter.

"Those men," he muttered. "Ruffians! They had masks on."

"Robbers?"

"No!"

"What were they, then?"

"I don't know," he temporized.

"But what did they want?" she insisted.

"Said for me to get out of the county—or else."

Ann's instinct for fair play was roused. She laid a hand on her husband's hot face.

"Don't worry," she said. "Men who come that way are ruffians, as you said. They are cowards. They won't dare do anything. Now let's try to go to sleep."

It was perhaps a week later that Ann, uneasy and unhappy, bundled herself against the cold and went for a walk across lots on the Clinton farm toward the woods. Her work with the other women for the Sanitary Commission was not going well. She could sense their antagonism—even from many of the women whom she had always known and liked. Now she was torn between her desire to help and her independent feeling that she had

no wish to go where she was not wanted.

Although the wind was cold, there was bright sunshine. She stopped to listen to the pleasant, familiar sound of the loud cawing of crows. Apparently something over the hill where Henry owned another farm with a large tract of heavily timbered land, was responsible for their raucous cries. Gazing in this direction now, Ann perceived a haze, and watching intently, she was sure she could see smoke from a fire which seemed to extend a considerable distance in both directions.

There had been a long dry spell, and Ann realized that a fire might mean serious trouble. As if to confirm her suspicions, the church bell in Jenks-town began to ring in the urgent, jerky way that people had learned to associate with trouble, in contrast to its usual calm ring on a Sunday morning. Ann knew then that others had also seen the fire and realized its danger. If it should spread, it might even endanger the buildings on Henry's farm, including the house where Jameson, his tenant farmer, lived. She wondered where Henry was. As usual, he had told her nothing when he had left that morning, so she didn't know whether he had gone on a trip or only to one of his other farms.

Hurrying down across the hillside to her home, Ann stopped just long enough to tell her mother about the fire and then started for the village as fast as she could go. Hearing the rumbling of a buggy on the frozen road back of her, she turned and saw that it was occupied by Enoch Payne and Tom

Wilson. They stopped and Enoch said, shortly, "Get in!" as he pulled the horse and cramped the wheels to one side so that she could climb up beside them. Then he urged the horse to a gallop. By the time they reached the village, most of the male population had gathered, armed with shovels or brooms. Everyone knew what a fire could mean in that heavily wooded country in a dry time. The church bell was still clanging, adding to the excitement and confusion.

As Ann looked at the crowd, she thought of what it means to a community when calamity strikes and all the active young men are gone. In the group now rapidly moving up the road ahead of them in the direction of the fire, she counted her old friends and acquaintances, Pastor Timothy Belden, John Crawford, the storekeeper, old Harry Cortright, and DeWitt Legg, all middle-aged or older. In fact, Enoch Payne was the youngest and most active man among them, with the exception of young boys like Tom Wilson. But if they lacked youth and agility, they were certainly not lacking in their determination to get to the scene of the trouble and conquer it. When Enoch had driven as near to the fire as he thought it was safe to take the horses, he jumped out of the buggy with Tom, telling Ann to watch the horse.

"I'm just as able to help as some of these old men," she objected. "I'm going with you."

A few moments later Ann could feel the heat from the burning pines and hemlocks. Fanned by the wind, the line of fire was at least a mile and a half in length and coming rapidly. She wondered what a few old men and boys could do to stop that glittering, flaming line of destruction.

But under Enoch Payne's directions the men were soon making an organized defense. With shovels and brooms they beat out small blazes set off by sparks in the clearing in advance of the oncoming main line of fire. Even in the midst of their work and worry, they found time to laugh at the scurrying rabbits, so scared by the fire that they had lost all fear of man. Ann watched a fox trot rapidly out of the woods and stop near her. He sat down facing the fire, barked indignantly at

it, then trotted away.

In a long open space considerably in advance of the fire the men started to dig a trench for a fire break, but they soon saw that they were making slow progress with hand work. One man rushed down the hill to the tenant buildings below them on the Bain farm to get a team and a plow so they could quickly plow a strip that would be too wide for the fire to jump over it.

As Ann watched, the fire reached the base of a majestic pine tree near the edge of the clearing. Almost before she could draw a breath, the flame swept into the lower limbs of the tree and quickly leaped to the top, making it a gigantic crackling torch of wondrous and awesome splendor.

Whipped and driven by the wind, eddies of choking smoke blackened the faces of the struggling men, reddened their eyes, and set them to coughing and gagging. Farther away, Ann could feel the hot breath of the inferno almost scorching her face. Suddenly, the fire reached the first uncompleted line of defense and crossed it, crackling and roaring as if in glee at the futility of man's puny efforts.

As soon as the team and plow arrived, the smoke-blackened men started another line, but the horses, made frantic by the noise and the flames, reared and plunged. When only halfway across the clearing with the first furrow, and in spite of everything the driver could do, the team turned and dashed madly down the slope away from the fire, with the driver yelling and cursing and pulling on the lines. Enoch Payne, who was holding the plow handles, finally was thrown free by the plow bumping over the rough ground. Then one of the lines broke, the driver let loose of the other, and the horses, galloping wildly now, with the plow jumping and plunging behind them, continued their break-neck dash down across the clearing to bring up finally against the side of the barn, trembling and with the sweat rolling off their sides.

After failing to make any kind of a fire break, Enoch and some of the other men gave brief consideration to starting a back fire, but gave the idea up, realizing that it would be utterly impossible to get a fire burning backwards with the wind blowing directly toward them.

The fire was now across the clearing and in the scattered trees on the lower side of the slope, the roar of the flames drowning out the shouts of the men. Staring at it, Ann found herself yelling, hardly knowing that she did so, as it came to her that all of the buildings and the farmhouse where the Jamesons lived were doomed. The men had now turned their efforts to turning the stock in the barn loose and driving it to safety. Then with pails, blankets and quilts they tried to save the buildings. Soaking the blankets with water from the well, they laid them across the roof of the house. When the wet blankets ran short, the rest of the shingles were soaked down with water. The tenant farmer, Jameson, who had been working with the others on the fire break, ran to his wife, where she stood with small children clinging to her skirts. She was white-faced from the strain and was wringing her hands in despair. Neighbors picked up the children and pulled her farther down the hill, where a democrat wagon was parked. Loading the family in, one of the men drove them back to the village and safety.

Now the crowd began to carry out the furniture from the house, piece by piece. Soon all that was left in the house was the heavy stove. Finally the group, faces streaked with sweat and blackened almost beyond recognition, stood helpless and resigned, watching the fire come closer and moving back only as the heat and smoke became too intense to bear. Within a few minutes trees close to the house sprang into flame, and almost at the same time,

(Continued on Opposite Page)

## SLIM &amp; SPUD

## The Grass is Greener on the Other Side

## NO DRUMS

(Continued from Opposite Page)

despite the soaked quilts and blankets, the roof of the house began to sputter and smoke. Here and there little forks of flame started in the shingles, then the small individual flames swept into a sheet of flame streaming high above the roof, until the whole house, which only a few moments before had been a home where folks lived and worked and loved, was nothing but a huge bonfire.

Driven back by the heat, yet fascinated by the horror of the fire, the small crowd moved slowly away from the house to watch the scene repeat itself on the big barn, only with greater intensity as the flames reached the big mows filled to overflowing with hay to feed the herd until spring.

"Well," DeWitt Legg growled resignedly, "it can't go much farther. There's nothing left to burn."

It was a downcast, silent group who walked and rode back to their homes in the village and the valley. In the buggy with Enoch and Tom, Ann had nothing to say. Enoch, too, was silent until they neared the Clinton home. Then he said, simply:

"I'm sorry, Ann. This means a big loss to you and Henry."

"Well, it couldn't be helped," she replied. "Everybody did what they could to stop it."

But her own feelings surprised her. She realized that she was thinking more about the loss and trouble Jameson and his family had suffered than of any financial loss to Henry and her. In fact, she had never thought of herself as being a part owner in Henry's property. He was too possessive. So far as his loss was concerned, she felt no more regret than if the property had belonged to a stranger.

Mrs. Clinton had supper ready when Ann got back, and after Ann had washed up, she told her mother briefly what had happened.

"Oh, I am sorry it was our property," exclaimed Mrs. Clinton. "What a terrible loss!"

Ann didn't answer, thinking of her mother's use of the word "our." Obviously her own feeling of having no part in Henry's property was not shared by her mother.

Before the meal was finished, Bain came home. One glance at his face was sufficient to tell the women that he knew what had happened. With the briefest of greetings he hung up his hat and coat, washed at the kitchen sink, and sat down at the table, while Mrs. Clinton hurried to put before him the food that she had kept warm on the back of the stove. They were accustomed to his irregularity at meal times.

In silence he ate a few mouthfuls, then pushing his plate away and shoving back from the table, he growled: "Well," he said, addressing Ann coldly, "you were there. What happened?"

Still very much stirred by the drama of the scene, Ann almost forgot his personal connection with the property as she vividly described the fire to her husband. Then, looking at his cold, set face, she suddenly realized what the fire meant to him, a man who set such store by property.

"Well," he said, sarcastically, "at least it made a picnic for you and the town folks. Seems as though they'd have done something about it."

"Henry Bain, how can you make a remark like that?" Ann exclaimed. "Those men fought that fire for hours. They did everything they could. Every one of them was exhausted."

"Yeah!" he sneered. "A lot of smart workers. Just a lot of doddering old fools. Didn't even save the house and barn. If there had been a few real men around, instead of all of them gone to this fool war, maybe they could have done something."

Ann leaned forward, her elbows on

## Celebrating 50 Years of FARM ELECTRICITY

These electrically operated model farm buildings shown at the Farm Electrification Anniversary Field Day, secured the immediate attention of these three youngsters.

**I**N SPITE of a steady downpour, over 3,000 persons attended the Golden Jubilee celebration of Farm Electrification in New York State on the Charles Timmerman farm near St. Johnsville, N. Y. on June 30. Fifty years ago Guy Beardslee, owner of a hydroelectric plant on East Canada Creek, built the first farm power line for a distance of four miles to Inghams Mills. Charles Cook was the first farm customer. From this small beginning, New York State now has 52,000 miles of rural lines serving 139,000 farmsteads — practically every farm in the Empire State.

Fortunately for the spectators, the exhibits featuring the old way and the electric way of doing farm work were housed under tents as was the speaking program.

Lieutenant Governor Frank Moore, Benjamin Feinberg, chairman of the New York State Public Service Commission, Dr. William I. Myers, dean of the New York State College of Agriculture, and Earle J. Machold, president of Niagara Mohawk Power Corporation were the speakers.

Dean W. I. Myers reminded his listeners that:

"If electric current had done nothing more for farmers' wives and farmers than free them from that pump handle and water pail, run the washing machine, heat the flat iron and light the house and farm buildings, it would

the table and her chin cupped in her hand.

"Henry," she said, deliberately and quietly, "I just don't understand you. I was at that fire all afternoon. There was a stiff wind right back of it, and, as you well know, the woods were dry as tinder. I never dreamed that a fire could run so fast or raise so much havoc. It would reach a pine tree and, in a matter of seconds, flame clear to the top. Of course they are old men, but they did what they could. They tried frantically to dig a fire break. Then they got a team and a plow. But with that wind back of the fire it was just too fast for them. Then they rushed down to the house and carried water by the bucketful to wet down the roofs. They got Mrs. Jameson and her children out, and took them down to the village. They rescued your stock and drove them down the hill. One of the men crowded his own stock to take in your cows and young stock and your horses. They even carried out the Jameson furniture and put it in their rigs, piece by piece. What more could have been done, even by young men, I don't know. And yet you sit there and criticize them!"

He started to speak, but Ann stopped him.

"You wait until I'm through. It's no

still be one of the greatest boons in the age-long history of agriculture."

Dean Myers went on to recount the many jobs done by electricity for dairy farmers, poultrymen, in fact all farmers. He said:

"An electric motor will do as much work in an hour as a man could do in ten, and do it for about two cents. In addition to reducing the costs of operation, the substitution of electric energy for human energy will eliminate much of the sheer monotonous drudgery from barn chores and help to keep enough of our finest boys interested in farming."

"Everything that can be said of the contribution made by electric power at the barn can be said for its application to household tasks and more. Electric lights, running water, household appliances, water heaters and laundry equipment have taken a good deal of the drudgery out of homemaking but much still remains to be done."

The Field Day was sponsored by the New York Farm Electrification Council made up of representatives of the New York State College of Agriculture, the State Public Service Commission, farm organizations, and electric utilities.

wonder you've been warned to move out of the county. What do you expect from people when you talk about them and treat them the way you do? Besides," she added, looking him straight in the eye, "you blow about the young men being away to war, not here to save *your* property; where were *you* today? I heard that question asked with some emphasis. Unless you change your ways, you're riding for a fall just as sure as the sun rises in the morning!"

Henry stared back at his wife. In the dim light of the candles on the table his face was white.

"You've given me an idea," he grated through his teeth. "You're right. They did warn me the other night to move out."

He straightened up, threw back his shoulders:

"And I told them where they could go. Now this is their first move."

"What do you mean?"

"That fire didn't just happen. It was set."

"No, oh no," she cried.

"Yes, oh yes," he retorted. "And if that's the way they want it, that's all right by me! They'll find that I can play their game, too."

# KERNELS, SCREENINGS and CHAFF

## SUNNYGABLES NOTES

By John Babcock

**I** HEARD a story once about a professor who observed that one student enrolled in his economics course, attended the first day of classes, and then was seen no more till the day of finals. He was naturally interested to see how the boy came out on his final examination—and, proud of his ability to teach, hoped in the bottom of his heart that the boy had failed. To his surprise, the delinquent student made the highest grade in the class, 96%. Calling the boy in, the professor asked him to explain his grade of 96% on the final examination.

"Well, sir," the embarrassed student replied, "I'd have done better, but that first lecture confused me a little."

It seems to me that a great many of the top administrative people in our country suffer from the same over-exposure to economics which frightened the student away. For instance, we've seen an attempt to raise beef production by controlling the price. This discourages the additional production through which lower prices are normally arrived at. We've similarly seen attempts to curb inflation on other fronts by controls—controls which pull at the traces instead of the reins.

No matter how the Korean situation turns out—and right now my skepticism of the Russians makes me think the affair will drag on and become even more serious as we try to arrive at fair peace terms—we will become more entwined in controls to the end that all of our industrial production may eventually be directed by the government through the Controlled Materials Plan.

I hope, as these controls take shape, that our government takes into consideration the importance of farm equipment in our defense effort. This is not only in the interest of the farmer, but of everyone who eats. Less than 4% of our steel production goes into the manufacture of farm equipment. The percentage slated for defense production is many times greater.

If even a small amount of steel is taken from farm equipment to swell the huge tonnage earmarked for defense production, the impact on our total food production will be disastrous. Yet, this relatively small amount would not contribute materially to defense output.

I hope and trust that this quite evident condition is seen in the proper perspective when our most pressing industrial needs are weighed.

### MIDSUMMER ROUNDUP

Occasionally we like to review happenings here at Sunnygables to see where we stand with the farm operation as a whole. By getting it all down

on paper, we get a better idea of where we stand, and hence where to go next.

### Pastures

Our number one crop at Sunnygables—pasture—has never been in better shape. Natural grass pastures that we have usually fallen back on by July have not been touched. Very heavy rainfall late in May and through June has left the irrigation system unused since we warned it up in anticipation of a dry spell. We have had to keep going with both cows and mowing machine to stay on top of the luxuriant growth.

In his pasture management program which calls for clipping the summer round, Boots has had good luck with what we call "progressive clipping." Where the grasses have headed out and become too tough for grazing, and too heavy to leave on the ground, Boots takes a few rounds each day. The cows seem to like the clippings as they dry out, and nibble away at them to supplement the tender juicy pasture that has been clipped. When they have about caught up with what he has cut, he takes a few more bouts.

### Forage

At this writing (the Fourth of July), we have not cut a spear of hay. They tell me in town that at one stretch, it rained 18 out of 21 days in June. Showers and soft ground even delayed silo filling more than we like. Boots has his big 19' x 45' silo filled and refilled to the brim, and Jack Conner's trench is filled and covered with a roof. Tough as the weather was, we have the bulk of our winter feed harvest behind us.

### Fertilizing Meadows

Jack and I exchanged sideways glances when we looked at the fertilizer bill for topdressing pastures and hayfields early this spring. When Jack saw the way our weakened stand of alfalfa responded for its seventh straight spring, he gave it another 300 pounds to the acre treatment of 0-20-20 without questioning the recommendations of George Serviss or Tom Millman.

Jack made the second application late, after second cutting had already started back. Due to a breakdown with his limespreader, he used the grain drill to put down the fertilizer. Although it was not quite as handy to use, Jack did observe that the fertilizer was applied nearer the ground, under the leaves. If there is ever a question of burning from fertilizer, Jack intends to use the drill again, feeling that less will be scattered on top of tender, new leaves.

### HAY AND THE WEATHER

After a year of listening faithfully to the Rural Radio Network weather reports, Jack is inclined to think they "have something." At breakfast, dinner, and when possible in the evening, he listens to the description of how the weather picture shifts and changes complexion. He has learned that when storms are plaguing the areas reporting to the west of Ithaca that he will usually be in for a shower within a short time at Sunnygables.

Through June, it was enough to make a fellow get downright mad at gloomy predictions over Rural Radio that showers were only a matter of

hours away—especially when the sky was blue and the air clear. As a rule, though, the reports were right, and more hay is saved cut late than left to rot in the windrow. I'm sure that without the 6 local reports, followed up by an over-all summary of the situation from Albany, the weather would have caught us with a lot of hay down. It has saved a good many farmers money this spring.

I've seen women shush up the family when their favorite soap opera is on the air. But that's nothing compared to the "shushing" many mothers and dads give out when their favorite and most fascinating continued story is on the air—Rural Radio's Latest Doings of Mr. Weather.

### SMALL GRAIN

A few years back, we decided to plant wheat very sparingly. There were just too many years when wind and wet weather made harvesting almost impossible. We kept oats in the picture since the crop can be used for grazing, silage or grain, and because we like it best as a nurse crop for seedings.

Since the war, however, we have grown more wheat and oats for cash crops and have a combine to justify pretty good acreage. This year we will have trouble harvesting a good part of our wheat. Plenty of water has brought on wheat, weeds and seedings. In many places, the wheat is badly swamped and lying flat. There is plenty of grain there, but we can't hope to get it all with a combine. At this writing, the oats look excellent. There will be plenty of oats and straw, but we are crossing our fingers that the tall stands don't go down in a windstorm before they are ripe enough to thresh.

### GRASS SILAGE OR CORN?

In areas where corn can be grown profitably for grain, it conflicts badly with grass silage plans. Early in June, when forage starts to lose its nutritive qualities, plowing, fitting and planting are the order of the day with the corn farmer. Realizing the value of

grass silage, and the need for adequate grass in his rotations, the corn farmer is torn between doing a good job with his grass, and with getting his corn crop started.

Corn is the cash crop, and since late planting may mean either reduced yields from earlier maturing varieties, or the possibility of soft corn at harvest time, the corn crop gets first attention in June. Some farmers have the machinery and help to take care of corn planting and silo filling at the same time. A few wet days, or machinery breakdowns, though, throw the whole program out of balance in a hurry.

There may be a solution to this predicament, but at this point, it looks like a man just has to make up his mind which is the most important—corn or grass. Maybe one way out will be to save second cutting for the silo and give corn the attention it has to have in June.

### IS SMITTY THROUGH?

A few months ago, we ran on this page a picture of an old Holstein grade with a knocked down hip, udder practically dragging on the ground, and the worst slump to her rump I ever saw on a cow. We offered her as evidence that a cow has a chance to last a long time in a pen stable.

After adopting 7 or 8 calves last winter, old Smitty turned out one of her own this June. Maybe the old gal just didn't have enough in her to bear another calf—not a whole one. Smitty's heifer calf was born with no sign of a tail at all. Mother Nature forgot to give her even the bones to hang one on. On top of that, the little heifer has the same shed roof drop to her rump that Smitty has. She is a forlorn little runt, but Smitty takes good care of her and seems proud as punch to have produced the first real living image of herself.

I don't know the odds on having a calf with no tail—and come to think of it, Smitty's Mistake is the first freak I've heard of in a long time.

We have used a fifty foot elevator to fill a 32 foot silo at Sunnygables. Shown above, at a farm in Ohio with which I am connected, is a 60 foot elevator being used to fill a 40 foot silo. An extra ten foot section on a 50 foot elevator did the trick, and though raising and maneuvering the overlength machine was dangerous and difficult, the rig worked very well. After silo filling, the ten foot section was removed, leaving the portable elevator balanced, and safe for use for bales, grain and ear corn. A five horse power engine on the elevator took care of a three ton load of grass in less than ten minutes, freeing a tractor for other farm work.

"The Miracle of Rubber" is a two-reel sound and color film which is available for showing to schools, industries, churches and other community organizations. It may be borrowed free, except for transportation charges, from any one of four offices of ASSOCIATION FILMS. Offices are located at 35 W. 45th Street, New York City; 79 E. Adams Street, Chicago; 1915 Live Oak Street, Dallas, and 351 Turk Street, San Francisco.

The Danville farm of the CONSOLIDATED PRODUCTS COMPANY, manufacturers of Kaff-A, is the home of triplet heifer calves. These calves, one of which has been started on whole milk and the other two on Kaff-A, will be exhibited at a number of national dairy shows.

JACUZZI BROTHERS of Richmond, Calif., have a device for a "Supercharger" which prevents the waterlogging of pressure tanks as a result of absorption of the air by water. This "Supercharger" automatically maintains the proper balance between the air and the water in the pressure tank of the water system.

Aramite is the name of a new mite killer developed by the Naugatuck Chemical Division of the UNITED STATES RUBBER COMPANY. Aramite is a non-toxic chemical to kill the mites which damage the products of fruit growers, nurserymen, chicken farmers and home gardeners.

According to the INTERNATIONAL SALT COMPANY, research workers at various colleges have proved that use of coarse rock salt in soil where sugar beets, canning beets, celery and cotton are grown increases the yields of these crops.

THE MCDOWELL MANUFACTURING COMPANY, Pittsburgh, Pa., has developed a new valve for use in portable overhead irrigation systems. This valve, now in production, greatly facilitates the setting up, moving and operation of lateral lines off the primary line.

MC CULLOCH MOTORS, Los Angeles, Calif., has developed a post hole digger which in less than a minute can be attached to the McCulloch chain saw. In this way two useful tools, the chain saw and the post hole digger, are available at a little more than the price of one.

TRANSITE irrigation pipe, made by Johns-Manville, is being used for permanent underground feeder supply mains for irrigation systems. This asbestos-cement pipe is lightweight, rust-proof, and has patent couplings that eliminate jointing compounds. Brochures describing the pipe are available from Johns-Manville, 22 East 40th St., New York 16, N. Y.

# SERVICE BUREAU

## Reward for Jailing Cow Thieves

By H. L. COSLINE

IF YOU and your neighbors have been so fortunate as to avoid the loss of one or more cows by theft, do not be lulled into a sense of false security. Cattle rustling is still going on. The State Police, Sheriffs, in fact, all law enforcement agents are alert and watching, but they cannot do the job alone.

On this page is the reproduction of a poster which is being widely shown. The \$100 reward for information leading to the arrest, conviction and imprisonment for at least 30 days of a cattle rustler who steals from a subscriber is our part in stopping this racket. Through it, we hope to encourage you, your neighbors, and everyone, to be unusually alert in watching for evidence and reporting it promptly. In addition to saving further loss of

cattle, such vigilance may bring you a \$100 check.

Read Commissioner DuMond's suggestions as to precautions you can take. Follow them carefully and, in addition, make it your business to jot down the make and license number of any suspicious-looking truck which you may see.

Investigate offers of "Bargain" cows and be especially suspicious of cattle that have had their eartags tampered with or torn out.

Clip out the "Plan for Action" which appeared on page 1 of the July 7 issue of AMERICAN AGRICULTURIST and post it somewhere where you will see it every day. The only way that cattle rustling can be stopped is to make it unprofitable, and the only way to do that is to bring cattle rustlers to justice promptly.

# \$100.00 Reward

For Information Leading To The Arrest, Conviction And Imprisonment (For At Least 30 Days) Of Persons Guilty Of

## RUSTLING CATTLE

From Any Farmer Who Is A Subscriber To American Agriculturist.

This Offer Expires Dec. 31, 1951 And Is Made By:

## Vigilance Can Stop Cattle Rustling

By C. CHESTER DuMOND

Commissioner New York State Department of Agriculture and Markets

CATTLE "rustling" seems to be increasing in New York State and in the entire Northeast. Not many reports of cattle thefts are made directly to the Department of Agriculture and Markets but the reports that do reach our ears indicate that the number of cattle stolen is growing.

There are several precautions that the individual owner of cattle can take to protect his property. First of all it seems that permanent identification of every animal in the herd takes the number one precaution spot. Most of our cows have eartags which show that they have been tuberculin tested or are participating in the brucellosis calfhood vaccination program or both. The numbers are registered at the Department's Bureau of Animal Industry in Albany. Eartags, however, can be lost, torn out or exchanged. If owners will, in addition, tattoo permanently their own numbers, name or other marking inside the ears of the animals, it would assist police officers in tracing stolen cattle.

When we use the term "rustlers," the punishment meted out in the Old West comes naturally to our minds. I am not suggesting that we "string 'em up" when caught but I am proposing that farmers can and should bring enough pressure of public opinion on their justices of the peace to get them to consider maximum punishments under the law instead of being lenient with the convicted thieves.

There are a number of things that can be done if the pasture is distant from the farm house. Of primary importance is more frequent visits to the herd. If the owner will visit the pasture often no thief can have too much of a start on him. And reporting a theft to the State Police or local officials should

be done as promptly as possible. The colder the trail, the more difficult is apprehension.

Then, too, don't make it easy for the thieving cattleman to reach the pasture with his truck. A private road of good access to the pasture is only putting the invitation in an engraved envelope. If there is a private road, see that it has plenty of obstructions to a cattle thief's truck. A locked gate is only one obstacle but it is better than none. This may suggest other methods to fit differently located pastures.

In at least one instance which has come to my attention, the posting of a bona fide reward by farmers in a menaced community has served to eliminate cattle stealing ever since the announcement was made. Offering a reward for information on cattle thieves should prove a valuable deterrent elsewhere.

It is good farm management to keep a description of each animal's outstanding characteristics, its age, a note on whether or not it is milking or carrying a calf; in fact a complete description along with the eartag number or tattoo number.

Other proposals have been advanced such as bonding all cattle dealers; requiring dealers to keep records comparable with those required at livestock auctions; licensing commercial haulers and similar steps, but those are not matters that farmers can take into their own hands to cut down the number of cattle thefts. They are matters for consideration by the Legislature. That is why I have not gone into those details at this time, it being my present purpose to suggest immediate means by which herd owners can reduce "rustling" or aid the duly constituted authorities in apprehending the thieves.

\$1000.00 check received by Gladys Patterson from Geo. Ellingham, agent of Allentown, N. J.

KILLED INSTANTLY, was her father Howard Patterson, farmer of Paterson, N. J., when his truck was smashed broadside by an auto as he drove onto a busy highway from a crossroad. He is survived by his wife and twelve children.

## Potatoes Staging Comeback

### "IT'S NOT A MEAL WITHOUT POTATOES"

*says the President of the Empire State Potato Club in this Down-to-Earth, Optimistic View of the Present and Future of the Potato Industry in the Northeast.*

POTATO growing in the Northeast is certainly "on its own" in getting on its feet. For several years the industry has been handicapped by various programs which have caused over production, poor eating quality, and general public distaste. Now growers are free to exercise their judgment in how much to produce and of what quality, in an attempt to win back the proper place for potatoes in the picture of human nutrition. We still believe "it's not a meal without potatoes."

#### Production

There was a reputed surplus of potatoes in the 1950 crop, but any thinking grower will tell you that there were not too many *good* potatoes. Top problems are the poorly graded and poor quality potatoes that reach our markets. No crop is 100% good, but too often our system of family farms requires that we sell everything we produce.

If 50% of our crop is top grade, and the rest off grade, there are those who argue that some one needs the low grades. The trouble is that the low grades tend to flood the market and have too much influence on the top grade price. Thus, a condition exists whereby the total income is too low in relation to cost. When we learn to sell the best and feed the rest, we will do much for the industry. Cost account figures at experiment stations show that poor potatoes are worth well over \$1.00 per hundredweight for feeding to cattle. Many good potatoes were sold for less this past season.

But production will take care of itself automatically. At recent prices, enough potato growers will be forced out of business to enable those who stay in to come out all right in the long run.

This is a serious problem and at present costs and prices, potato production is bound to undergo changes. For example, the grower

By H. J. "Red" Evans

of small acreage can't compete at low prices with the producer who has volume enough to utilize labor-saving equipment and methods. One good grower told at a recent meeting how he harvested his crop last fall for about one-half what it cost for the same operation in 1949 by utilizing mechanized pickers and loaders in the field and a mechanical un-loader at the storage. The time is here when it is cheaper to buy the family potatoes than it is to grow them.

Another factor rapidly coming to a head is the grading and packaging operation. New York is about the last area in the country where the grower still grades his crop himself. Most markets demand more uniform grading and volume production, secured only through packing house operations where experienced full-time crews and up-to-date machinery make this less costly and more efficient. Some producers have such plants, and central packing plants are increasing even in New York. There is a decided trend in that direction, and it will continue from an economic standpoint as well as a marketing factor. The potato industry is in the process of change from the old to the new ways of going to town.

#### Consumption and Utilization

Many people worry about the decrease in per-capita consumption. This statistical figure has gone down, but so has the one for some other staple commodities. As far as potatoes are concerned, it is not too serious because the present figure can be interrupted for what people eat, and a few years back it was what went to market.

Not long ago we sold potatoes to families and grocers to store for winter use. Now they get weekly or twice weekly deliveries. The shipper absorbs the shrinkage instead of the

owners who had them in storage. Also we must admit that fresh winter vegetables are much more available, and the home freezer has garden stuff the year around. While this may cut potato consumption, it should also stimulate production and marketing of better quality tubers, packed as the consumer wants them, and made available everywhere in good condition.

Some other factors enter into the consumption angle. During recent years potato chip production has increased until that industry now utilizes over 20,000,000 bushels a year. They need potatoes of certain quality and the growers will supply them. Potato salad and other products take an increasing amount of tubers annually. City folks like to buy their salad all made up. Other potato products on the market are canned whole small potatoes, as well as diced and sliced ones. A newer product is fresh peeled and cut potatoes ready for the kettle.

#### Merchandising

One of the greatest needs in our industry is better merchandising. This involves a better pack to start with—one which can be advertised and handled as a staple uniform product. There are lots of indications that this will be done. Many of our larger growers, shippers and cooperatives have consumer packs and brands of reputation. The Adirondack Potato Growers are hoping to have a superior pack beginning this fall. Several dealers and cooperatives have washing equipment, and this operation may become standard.

Better quality—eating quality—is being produced voluntarily because growers are eliminating the varieties that don't grow good enough for them to eat themselves. Also we find many livestock men ready to take the culls and low grades at fair prices because they have found that potatoes are equal or better than ensilage for stock, and cheaper. So, improvement in

(Continued on Page 6)

# The Fourth Freedom

*"...the right of the people peaceably to assemble..."*

AMERICAN DEMOCRACY is built on free assembly, the right of free people to meet together and say what they think.

Free assembly is the means through which people control the agencies they have created to serve them—their governments, their clubs, their lodges, their schools, their cooperatives.

One such agency is G.L.F.

Farmers built G.L.F. to purchase their farm supplies and to sell some of their farm products. It is big because so many farmers use it. It is efficient because of the volume of business

they give it. But the important thing is that it is owned by its users—by you and 115,000 other G.L.F. members. You own it and you can control it. The method of control lies in free discussion at your Patrons Annual Meeting and in the election of good member committeemen to represent you.

When the weather is hot and work is heavy and the meeting is fifteen miles away, it's a lot easier to stay home. But the future of G.L.F. is in the hands of those who go.

Cooperative G.L.F. Exchange, Inc., Ithaca, New York.

*Take part in your G.L.F. Annual Meeting*

From left to right: Walter Derniak, Schenectady, N. Y., County Agent, Jacob Knutti and his two sons, Walter and John.

## Quality Roughage CUTS DAIRY COSTS

**T**HE 28 milkers on the Jacob Knutti farm near Schenectady spend a good share of each winter day in manufacturing hay, silage and grain into milk. The first thing in the morning they get silage, either corn or grass along with grain. The heaviest producers, some of which give 60 pounds of milk, get 4 quarts of grain and the amount per cow is reduced for the lower producers. The grain ration is a little under 20% protein and is made by mixing 2 bags of 20% dairy ration, 1 bag of oats and ½ bag of 30% supplement.

After milking, the cows are fed hay and after breakfast the stables are cleaned and the cows get a feeding of second cutting alfalfa. About noon they get another feeding of hay, and before the evening milking they again get silage and grain, and hay after milking. The cows that produce 60 pounds and which are fed 4 quarts of grain twice a day, get about 1 pound of grain to each 7 pounds of milk which any dairyman will agree is efficient winter feeding.

### A Good Milk Market

Milk is the chief source of income on the farm of Mr. Knutti, and his 2 sons, John and Walter, have an exceptionally good market. They sell to a local distributor who pays them the Class I price. In exchange for this good market a real attempt is made to keep milk production uniform throughout the year.

Mr. Knutti started farming here in

1919. At that time there were 78 acres in the farm, but soon more land was bought to bring it up to 140, and an additional 40 are now rented.

The cows on this farm get unusually good roughage. Alfalfa and timothy is the main mixture and meadows are left down as long as they give a good crop. As a result, the boys say they do less plowing than they used to do. They have tried ladino but most of it has been run out by the grass. John remarked that it made good pasture but that they are not enthusiastic about it for meadows because it is hard to cure and yields are lower than alfalfa.

### Little Permanent Pasture

On this farm there are only about 8 acres of permanent pasture. Meadows are pastured as need arises. Sometimes a field is pastured early and then cut for hay or grass silage. Fields that are mowed early are always pastured late in the summer if they are not again cut for hay. When a dry spell cuts the amount of pasture available, the cows get grass silage and if the silo is not empty in the fall, corn-silage is put on top of the grass.

The boys have used molasses on grass silage but they felt they wouldn't add anything this year. They tried wilting the grass one year but overdid the wilting and had some moldy silage.

Manure, reinforced with superphosphate, is drawn out every day when the weather permits. It is used on corn ground and some is put on meadows.

Some replacements are raised; they have 12 head of young stock in the barn now. Some are also purchased—particularly when it is necessary to maintain even production—and, as a usual thing, these are cows about to freshen which are sent here from Canada.

The Knuttis believe that a good team of horses is still a good thing to have on a farm. They use the team for mowing, cultivating, and other light jobs, but they also have 2 tractors which they use for plowing and harrowing, threshing grain, harvesting corn for silage, running the field baler and other heavy jobs.

The things which impressed me about the farm were that the grade herd looks like a bunch of producers, and the story told me indicates that the roughage grown on the farm is unusually high in quality. As a result, good production is obtained with a minimum of grain.—Hugh Costline.

NEVER AGAIN!

Careless Joe! Send Him A Wreath.  
In The Rain He Stood Beneath  
The Only Tree for Yards Around . . .  
THAT'S The Tree The Lightning Found!

## More Ears..Fewer Husks Faster Picking

That's why a **NEW IDEA**  
is a good idea!

**NEW IDEA Two-Row Picker** (top picture) handles 12 to 18 acres per day. Both are one-man rigs, tractor-powered. Rear-mounted elevator standard on both types.

**NEW IDEA One-Row Corn Picker** (above) picks, husks and loads up to 12 acres daily.

Thick ears, thin ears, runty nubbins — on straight stalks and down stalks alike — your NEW IDEA Picker leaves fields clean. Flexible floating points team with low-reaching gathering chains to take the stalks. Blunt-end snapping rolls bring the ears through with least loss or crushing. Even the "handful" of corn shelled in husking goes on the wagon.

You crib cleaner corn too. Ears pass steadily under two sets of presser wheels — closely hugging the sure-action husking rolls. Husks are loosened and off in a hurry. A powerful fan finishes the job by blasting away all waste.

And your harvest goes faster from start to finish. Takes mere minutes to hitch or unhitch your NEW IDEA Picker. Pulls lighter because it's properly balanced. Completely self-contained. Easily controlled. Built in every way to save hours as well as ears! If you don't own a NEW IDEA Picker — now is the time to see your NEW IDEA dealer.

## MAKE "GRASS ROOTS" WORK

THE week of August 19 will be a red letter date for thousands of G.L.F. members. Three hundred of some 500 local annual meetings are scheduled for that one week.

Farm organizations, school boards and other local organizations are often criticized because their meetings are not democratic enough. Frankly, I think the ones to be criticized are the parents, the taxpayers, and the members of the organizations, because so many of them do not attend the meetings and take an active part.

A real effort is being made by those in charge of local meetings to give you all the information available, to get your advice, and to make the meetings interesting. If you want to make grass roots government work, all of these local meetings are an important and necessary place to start.

On the other hand, it should be said to local leaders who have the responsibility for these meetings that many of the programs are so dull that members cannot be blamed if they don't come a second time. Not only should there be a full and clear explanation of the business involved, but there should also be some entertainment and, if possible, something to eat. Nothing furthers good understanding more than breaking bread together.

## TRY SOME PRACTICING

AT the big meeting of the American Dairy Association mentioned elsewhere on this page, attended by over 200 representatives of dairy organizations, no milk was served at the dinner unless a guest made a point of asking for it. Nearly everybody drank coffee.

Now, I like coffee as well as anybody, but I submit that dairy leaders need some "kidding" when time and again at milk cooperative organization banquets, there is little milk offered or drunk. Isn't it about time we preachers did a little practicing?

## AUGUST 4 IS THE DATE

THE annual meeting of the New York Artificial Breeders Cooperative will be held at Ithaca on August 4. Last year it was one of the best organized and most interesting meetings that I attended during the whole year.

The chief reason for the interest—which this year will be greater than ever—is the big increase in the number of dairymen who are using this method of breeding dairy cattle. Starting from zero in both membership and cows in 1940-41, the organization has grown in just ten years to 36,000 members and 215,000 cows.

In a pioneer project, there are of course many problems to be worked out. Many of these will be discussed at the annual meeting; but on the whole, dairymen are to be congratulated on the progress they have made in this rather marvelous new method of improving the dairy cow.

## LET FARMERS ALONE

EVER since Secretary Charles Brannan of the U. S. Department of Agriculture has been at the head of the department, he has planned and worked for all-out control of American farms and farmers. After using the tremendous government propaganda machine to the limit, he has not been able to sell his so-called "Brannan Plan" either to Congress or to the American people.

So now Secretary Brannan comes up with his "Balanced Production Plan," which has even worse possibilities from the farmers' standpoint than the Brannan Plan. According to the newspapers, Mr. Brannan's theory is that if every acre of farm land were used for the purpose for which it is best suited, if every hour of farm labor were efficiently used, the nation would have a "balanced" farm production. To put this new scheme into operation would re-

*By E. R. Eastman*

quire a tremendous number of government employees, whose business it would be practically to take over the management of American farms, at a cost to the government and to the taxpayers of from \$50,000,000 to \$75,000,000 a year.

Such a scheme is fraught with tremendous danger to the right of the individual to run his own business, and to our American liberties. What farmers need, as far as government and politics are concerned, is a good letting-alone.

## BEST IN THE WORLD

THE BELIEF of some of my Midwestern friends and of many representatives in Congress that we have no agriculture of importance here in the East always makes me a little peeved. To be sure, the Midwest is a great farming section. But so is the Northeast. In fact, if you include New Jersey, Northern Pennsylvania, all of New England, and New York, where AMERICAN AGRICULTURIST circulates, the Northeast is in most respects the greatest farming section in the world. If you don't believe it, consider these facts:

### WHILE THE NORTHEAST HAS ONLY 5% OF THE FARM ACREAGE, IT PRODUCES:

22% of the dairy products	\$815 million
23% of the poultry products	628 million
23% of all vegetables, including potatoes	403 million
37% of the potatoes	170 million
23% of the apples	71 million
33% of the clover or timothy for cut hay	191 million

### AND HAS:

13% of the implements and machinery	\$686 million
12% of the farm automobiles	515 thousand
16% of the trucks on farms	245 thousand
12% of the tractors on farms	283 thousand
20% of the running water on farms	332 thousand
15% of the electricity on farms	421 thousand

### AND BUYS:

28% of the livestock feed purchased	\$553 million
17% of the fertilizer and lime	86 million

### AND HAS NEARBY MARKETS WHERE 28% OF THE TOTAL U. S. POPULATION LIVES AND EATS!

## NATURE ALWAYS TAKES OVER

EVER since I was a small boy, I have much preferred berrying to fishing. We have a berry patch on our farm where the bushes have got out of hand and are higher than my head. But still my eight-year-old grandson Dickie and I have been able to pick two or three bushels of red raspberries in the patch, and there will be even more blackberries. Up there in the patch it is possible to get almost completely separated from the perplexities and worries of modern life, as one listens to the catbirds calling "Thief! Thief!" and hears the soft sighing of the wind.

While picking berries there the other day, I was thinking how Nature takes over after man has scarred the earth. Plow a piece of land and leave it, and it's only a short time until Nature spreads her carpet of grass, and the grass is soon followed by weeds. In the woods, where trees have been cut, it isn't long before raspberries spring up, and they in turn are soon crowded out by blackberry bushes. Then comes the brush, and within a few years the woods are growing there again, and the cycle is complete. Not long ago I walked through a piece of woods where some of the trees were 8 to 10 inches in diameter. On that very piece of ground more than fifty years ago my father, brother and I raised a

piece of potatoes.

From a practical farming standpoint, the way the bushes and brush take over isn't so good. With today's speed farming with tractors, we no longer mow very close to the fences, so each year the hedges grow out farther and farther. Our fathers would have said that this is taking poor care of the land.

## CONGRATULATIONS!

THE National Dairy Council, the American Dairy Association, and Milk for Health, Inc., are to be congratulated and highly commended for securing the necessary membership of dairymen in the New York Milk Shed to start the campaign to publicize and advertise the great food qualities of milk and dairy products. A dinner meeting of the American Dairy Association in Syracuse on July 17, attended by over 200 dairy leaders from New York and from 40 other states, celebrated the securing of enough contracts from dairymen to take the first step in the Milk for Health campaign.

It is only the first step, but if dairymen and milk dealers continue to support the American Dairy Association, the National Dairy Council organizations, local and national, and Milk for Health in New York, it will do more than any other one thing to maintain high consumption of milk and dairy products, thereby increasing the health of the consumer and the prosperity of the producers.

## BAD SUMMER FOR HAYING

IT IS saddening to ride up and down the farm country and see the amount of good hay that has been partly or entirely spoiled by so much rainy weather. In order to get enough hay down to make a good job for the baler, it is necessary to cut loose a considerable acreage. Then if two or three days of rain follow, large quantities of hay are practically ruined. There has been much of this poor stuff burned, and some farmers have chopped it and left it on the land.

More and more farmers are using grass silage in order to beat the tricky weather that we seem to get so frequently in recent summers.

On the other hand, it has been a good growing year. Rains have kept the pastures good, and I never saw corn or potatoes looking any better. Incidentally, we had sweet corn out of the garden for Sunday dinner, July 22. Who in this latitude can beat this? My neighbor did beat us by a few days, but he started the corn in the house and transplanted it.

## BEHOLDEN!

A FRIEND of mine recently said to me that she hated to be beholden. According to the dictionary, this means "obligated to anyone else."

That feeling of disliking to be beholden comes from the old Yankee principle of standing on our own feet and not depending on anyone else for anything that we can do for ourselves. It is a good principle which too few people follow today; but like all good things, it can be followed to the extreme, for after all, we are beholden to our friends, our families, our parents, to all those we love, and to our God. We cannot help being obligated in some way to others. What we can do is to pass on to others in some way the good things they do for us.

## EASTMAN'S CHESTNUT

A FRIEND, returning recently from Detroit, was excited over his experience in watching new cars roll off the assembly line.

"It's just wonderful," he said. "First they start out with little pieces, then these roll down the line and thousands of men and a million dollars' worth of machinery put all the little pieces together. Finally a shiny new car rolls off the line."

"Then a woman driver buys it. Five minutes later, back to little pieces!"

# AA's Farmers' Dollar Guide

**PRICES:** Farm products have declined for 4 months; now 4% below February. Factors working against inflation include: 1. Good prospect of "cease fire" in Korea. 2. Excellent crop prospects. 3. Industrial production for first 5 months of '51 is 14% above a year ago and 21% above same period of '49.

Factors working for inflation: 1. Continued wastefulness in government expenditures. 2. Defense spending which will be continued, but may be slowed somewhat by "cease fire."

Consideration of all factors fails to warrant prediction of "spiralling inflation" next fall, without a stronger price control law. Drive of Administration for letters to Congressmen urging controls is totally unwarranted. Such campaigns cost money—YOUR MONEY—and detract attention from most-needed action—strict government economy. Controls add to government costs, discourage needed production, and are not effective. Tell that to your Congressman!

**NEW FARM PLAN:** As soon as the price control fight is over, Washington is expected to turn its attention to price supports for farm products. Quite a shift! Before election, a new Administration farm plan is expected. The theme is "balanced production" and it's aimed at spreading "know-how" to small farms. Tools will be farm management experts and cheap loans. The government will provide the advice and loans, and the taxpayers, as usual, will foot the bill. Looks like a big step toward socialized agriculture. Cost has been soft-pedaled, but is rumored to be at 50 to 75 million dollars a year. This will be on top of price supports, which will not be abandoned. Alternative, which would cost taxpayers nothing, would be to let supply and demand prices encourage or discourage increased farm production as needed.

**BUYING FARMS:** Many young men are faced with problem of buying—or not buying—a farm. Big investment is now needed to finance farm, but factors favorable to buying include: 1. Population is increasing rapidly; more mouths to feed. 2. Ability of farmers to increase production as fast as population grows is doubtful. 3. Mechanization is increasing farm efficiency.

Prospects indicate good farm conditions for some years to come. If you plan to buy a farm, why wait? It IS important to buy the right farm—one with naturally productive soil and good buildings. It is cheaper to buy buildings than to erect them at present prices.

Biggest unfavorable factor is growing tendency toward government control and regulation which hamper ability of farmer to manage his own business.

**CROPS:** The latest crop information indicates the following: **Wheat**—1,070,000,000 bushels which is 48,000,000 above last year and is made up of 707,000,000 winter wheat and 363,000,000 spring wheat. **Corn**—3,295,000,000 bushels; 164,000,000 above last year. **Oats**—1,368,000,000 bushels; 87,000,000 less than last year. **Barley**—263,000,000 bushels; 38,000,000 less than last year. **Hay**—113,000,000 tons, a new record; 7,000,000 above last year. **Soybeans**—14½ million acres planted; about the same as last year. **Potatoes**—365,000,000 bushels, the smallest since 1941 and 83,000,000 bushels below last year. **Dry beans**—16,000,000 one hundred-pound bags, a little less than last year. **Sugar beets**—10,000,000 tons, about one-third below last year.

It is illegal for the USDA to forecast the cotton crop. nevertheless, many parties are interested and you can't stop them from guessing. The latest guess is 16½ million bales—a bumper crop.

**ETHICS:** Testifying before a Congressional Committee, D. A. Hulcy, president of U. S. Chamber of Commerce, urged a "Commission on Government Ethics" composed of government officials who would enforce their decisions by moral persuasion. He said, "When government sprawls all over... it becomes too big to watch. Abuse of power and position are a natural corollary." He emphasized the need for "a revival of those moral convictions which went into the formation of our Republic."

—Hugh Cosline

## The Song of the Lazy Farmer

I didn't pick this place to sit just 'cause it's not far from his fence where I can see his lack of sense. The poor guy acts like he's ashamed, and come to think of it I'm blamed if I don't think he ought to be, if it irks him like that, by gee. Like me, he should rest ev'ry day, he'd live a lot more years that way.

THE strangest thing about mankind is how most folks will try to find somebody else on whom to pin the blame for troubles they get in. For instance, look at neighbor there, he's grumpy as a grizzly bear 'cause I ain't doing anything while he makes his old tractor sing. Each time he passes near my tree, he throws a dirty look at me, and after each third round or so, he throttles down and passes slow so he can yell, "That silly smile will get me angry after while; why don't you go away some place where I can't see your ugly face? It's bad enough to have to work, but worse to do it while you smirk."

Now I claim that ain't neighborly, why should he take it out on me? I'm not the one who plans his day, I don't force him to work that way; he too can loaf if he wants to and operate the way I do. So I don't know why I should go, my neighbor surely ought to know that this spot is my favorite,

# LET DE LAVAL MILK YOUR

Many dairymen find that their present milkers do not successfully milk all their cows... some of their cows require special, time-consuming attention.

Based on our more than 33 years of experience in designing and building De Laval Milkers and the knowledge that comes with the milking of hundreds of thousands of herds and untold millions of cows... we say that we are confident that a De Laval Milker will do a fast, clean and complete job of milking all your cows.

De Laval uniform milking... controlled at every vital point; De Laval "Full-Flo" Teat Cups with

their comfortable, pleasing action—all combine to successfully coax the milk from almost every physically normal cow we've ever seen.

But... there's just one sure way to prove this for yourself. Call your local De Laval Dealer and tell him that he is invited to come out to your farm and match the De Laval Milker against your present machine in milking your hard-to-milk cows. We're perfectly willing to have the results determined by the success of the De Laval Milker... and your own good judgment.

Make this test today... without any obligation. It may help you save a lot of time and money.

Ask Your De Laval Dealer For A Free Demonstration—Without Obligation

## Have You Seen the New De Laval SPEEDWAY "FRONT-LOADER" MILK COOLER?

For easier, fast and low-cost milk cooling the new De Laval Speedway "Front-Loader" is the one milk cooler you should see... and use. Made in three sizes.

**De Laval Magnetic Speedway Milker**  
De Laval engineered for still better, faster, cleaner milking. New stainless steel unit and Pulsor Pump. Easy to clean.

**De Laval World's Standard Series Separator**  
Cleanest skimming, easiest-to-clean separators ever built. Every part milk touches is stainless steel.

## Increase Winter Wheat Yield per Acre Cut Costs per Bushel!

Heavy application of complete plant foods gives as great a return on wheat as on any of the major field crops, according to the experience of many farmers.

They know it pays to fertilize fall-seeded wheat and legumes generously with the properly balanced ration of mineral-rich plant food nutrients.

So use plenty of fertilizer to get better root and top growth so your grain can withstand unfavorable winter conditions. Be sure to get enough to give you the extra benefit of building the fertility of the soil for profitable growth of the crops to follow.

There's an *International Fertilizer Dealer* near you who is ready now to help you select the grades recommended in your territory—and to arrange for prompt delivery. So see him soon.

### Quality for 40 Years

When you insist on *International Fertilizers*, you get plant foods known for more than forty years for their high quality.

You get plant foods produced by the only manufacturer which mines and refines its own potash and phosphate.

You get the crop-producing power of plant foods that are expertly mixed and correctly graded.

International Plant Food is a smooth-flowing mixture that is easy to handle in the field.

## The Question Box

**We have had some disagreement about the difference between yellow rocket and mustard. Can you set us straight?**

Yellow rocket is a winter annual. It starts growth in the fall and lives over the winter. You can always identify it by the rosette of leaves close to the ground. In the spring it blossoms earlier than mustard and usually grows best in new meadows. Mustard is an annual, does not have the rosette of leaves, blossoms later, and is commonly found in spring grain.

\* \* \*

**Can sweet cherries be frozen satisfactorily?**

The Geneva Experiment Station says 'yes' but better stick to firm fleshed varieties like Schmidt, Lambert and Bing among the dark-colored varieties, and Victoria and Napoleon among the light-colored.

\* \* \*

**What proportion of cows in the country are now bred artificially?**

The latest figures we have indicate that more than 4 million cows in nearly one-half million herds are now bred artificially, or about one out of 6 dairy cows in the country.

\* \* \*

**What is the State tree of New York State? What northeastern states have adopted state trees and what are they?**

New York's tree, which is unofficial, is the hard or sugar maple. Other state trees are: Connecticut—white oak; Delaware—American holly; Maine—white pine; Maryland—white oak; Massachusetts—the elm; New Jersey—red oak; New Hampshire—white birch; Pennsylvania—hemlock; Rhode Island and Vermont—sugar maple.

\* \* \*

**What is the cause when nearly ripe peaches show juice which has exuded and hardened?**

This is doubtless the oriental peach moth which often bothers, particularly in the home garden. The oriental fruit moth lays its eggs on the tips of the peach twigs and when they hatch they bore through the peach twigs causing them to die at the tips. Later on when the fruit begins to ripen the worms enter the fruit.

In a home planting use a cupful of 50% wettable DDT in 5 gallons of water as a spray. To control brown rot, wettable sulphur can be added at the rate of  $\frac{1}{4}$  pound to 5 gallons of spray.

\* \* \*

**What is the best way to control Mexican bean beetle in the home garden?**

Use a general purpose dust which contains copper and rotenone. The rotenone is what kills the beetles, but the dust will handle most common diseases and insects. Look on the undersides of the bean leaves occasionally and start dusting as soon as you see the beetles. If you wait until they get too plentiful, you will find them difficult to control.

\* \* \*

**Last fall I had a vegetable pit made in my cellar beneath the cellar floor. This pit was made of cement blocks, contained a sand bottom and is 4 feet wide, 4 feet deep and 8 feet long. In this pit I put celery, carrots, beets, turnips, cabbage, and potatoes. Everything sprouted and rotted, and we were unable to use any of the vegetables.**

No vent was put in this pit and I don't know whether one should have been put in or not. If so, do you know how one should be put in and what should be used to make the vent? If a vent is needed, should it be put in the outside or inside the cellar?

I would suspect that your principal trouble was that your storage compart-

ment was too warm, particularly if you sunk it in the cellar floor. If you had tunneled out from the side of the house you could have put in a vent of cement blocks fairly easily. Temperature ought to be in the neighborhood of 35 degrees for most of the crops that you mention, and the humidity should be kept fairly high. If you put in a vent, it should be connected to outdoors. Possibly this could be done with tile or galvanized pipe. If the pipes are not over 8 inches in diameter, you probably would need two to get circulation.—*Paul Work.*

\* \* \*

**Should black raspberries and red raspberries be grown at some distance or is it all right to put them close together? Is it all right to grow everbearing raspberries and strawberries near other varieties?**

The everbearing raspberries and strawberries may be planted with the one-season varieties. It is sometimes advisable to separate black raspberries from red raspberries as the red raspberries sometimes have diseases of which the symptoms are not very obvious and while these diseases do not injure the red raspberries seriously they may seriously injure or kill the black raspberries. If you are positive that your red raspberries are free from any of these diseases they may be grown alongside of the black raspberries without fear of injury to the latter. If you separate them they should be at least 300-400 feet apart.

—*George Slate, Geneva Experiment Station.*

### POTATOES STAGING COMEBACK

(Continued from Page 1)

general is on the way.

One sad commentary is that we still have too many growers who don't want to grade well and do sell to the buyer who wants a lower priced article. He in turn cuts the price on the market and the consumer gets the poorer potato. The retailer uses the low price to knock down the price of good potatoes and no one is pleased. As soon as we can voluntarily eliminate this practice we will all benefit. The grower can get a better price, the consumer will get a better potato, and more will go to market. Today, any grower who has good potatoes can get a good market thru reputable potato handlers. Let's use them more and cut out the shady buyer.

### Summary

All things considered, the potato industry is not too bad off. We can produce the kind of potatoes the market wants, pack them to meet the qualifications of consumer and processor, and we have the facilities to reach the ultimate consumer to best advantage. We need to utilize our best judgment in production, utilization, and merchandising, and the greatest need is merchandising.

We know we can produce but we are hurting ourselves by not applying the same human acumen to our marketing. The future is bright, however, because the younger generation is capitalizing on the experience of the past producers.

# Weather Favors GRASS SILAGE

By L. B. Skeffington

**T**HE weather this summer has been the greatest booster for more grass silage. Numerous farmers say they never have known a year when it has been so difficult to make hay. Intermittent rains and humid weather have seen field after field of cut hay ruined or damaged.

After hay has been soaked and turned, only to lay again on wet ground, some farmers have run it through field choppers and left it on the land. In a number of places it has been burned in windrows, and other farmers were hoping it would dry enough to burn. As this is written, a number of farms report they are still working and sweating on first-cutting, and later than in any recent years. Much hay grew coarse before it could be handled.

Farmers who are feeling best about the situation are those who put a lot of it into silos. Some farmers who never before put grass or hay in silos have done so this year. Frequent remarks heard are to the effect that plans are being made to handle much more grass silage next year, as the result of disappointments and losses in trying to make hay of this year's first cutting.

But while rains have hurt hay, they have kept pastures growing exceptionally well. Corn is growing good in spite of the generally cool nights. Wheat has been ripening rapidly, although here and there one sees considerable lodging as the result of slashing rains and hail. Severe hail damage to beans and grapes is reported in Seneca County. In Ontario and adjoining counties, beetles and slugs on beans have caused more damage and been harder to control than at any time past.

## Market Body Organizes

Members of the new Genesee Valley Market Authority have named temporary officers, pending adoption of by-laws and election of permanent officers in Rochester, Aug. 7. When the 15-member body had its first meeting, Robert G. Wilcox, Senior marketing specialist of the State Department of Agriculture and Markets, was named temporary chairman, and Winton J. Klotzback, assistant Monroe County agricultural agent, was named temporary secretary.

Wilcox was named a member of the Authority by State Agricultural Commissioner DuMond. The other 14 members were named by boards of supervisors in nine counties. They are: Monroe County—Ward A. West, Irondequoit; Donald C. Shoemaker, Webster; and Morris H. Levinson, Rochester. Livingston County—W. Marze Blair, Nunda, and Kenneth A. Noble, Linwood. Ontario County—Joseph W. Robson, Hall, and Loreto J. DeMartinis, West Bloomfield. Wayne County—W. Lorenzo Palmer, Williamson, and George W. Kemp, Macedon. Orleans County—John W. Tucker, Kendall. Genesee County—Anthony H. Garbish, Elba. Wyoming County—Hollis H. Clark, Wyoming. Yates County—Leon A. Swing, Penn Yan. Steuben County, Murray Barnes, Avoca.

Creation of the Authority followed a campaign of many years to establish a modern regional market in the Rochester area. A year ago the Governor vetoed the bill creating the Authority because of an error in it, but this seems to have aroused more interest and spurred the fight as never before. A nine-county farmers' marketing committee favored a site south of Rochester, but the new Authority plans to inspect

other regional markets before considering sites and facilities.

## 'Caveat Emptor'

When you buy a bull calf for breeding purposes and it doesn't turn out to be a breeder, that is your hard luck, unless you have a contract that specifies differently. The Appellate Division at Rochester unanimously decided against two New York State men who bought a 16-day-old bull for \$5,000. After raising it and spending \$1,150 for treatments, they said the animal had a value of only \$200 for beef because it had been born sterile.

The court's opinion indicated that the condition of sterility could not be determined until after the bull was a year old, and that the buyers assumed the chance of sterility as one of the elements of the bargain.

## Sprays Damage Crops

Several farmers in the vicinity of Penn Yan are suing Yates County for approximately \$200,000 alleged damages to crops and plants damaged or killed when the highway department ordered brush along the highways sprayed. It is claimed that on the day the spray was applied a high wind carried the spray into vineyards and berry fields.

## MILK FOR HEALTH OUTLINES PROGRAM

**M**EETING in the Onondaga Hotel in Syracuse on July 17, Milk for Health, Inc., dairymen's milk advertising fund-raising organization, held a membership meeting re-electing all members of the board of directors, and a directors' meeting at which last year's officers were re-elected.

Also selected were seven of the eight producer members of the Dairy Council of New York. Those attending also heard a report by E. M. Harmon on the progress of New York City milk dealer organization indicating that dealers handling some 70 per cent of the 90 per cent goal of Class 1 milk in the Metropolitan market had been signed up to form the dealer portion of the projected Dairy Council.

Directors and officers of Milk for Health, Inc. re-elected were: Jacob F. Pratt, president, representing New York State Farm Bureau Federation; Harvey Wittman, vice-president, Niagara Frontier Cooperative Milk Producers Bargaining Agency; R. P. Kinney, treasurer, Eastern Milk Producers' Cooperative Association; James A. Young, Metropolitan Cooperative Milk Producers' Bargaining Agency; A. Morelle Cheney, Dairymen's League Cooperative Association.

Also, C. L. Dickinson, Cooperative G.L.F. Exchange; Leroy F. Lyon, Crowley's Milk Producers' Cooperative Association; Oscar G. Smith, Rochester Cooperative Milk Producers' Bargaining Agency; Harold M. Stanley, New York State Grange; and Thomas L. Lawrence, United Milk Producers of New Jersey.

Designated as producer members for the Dairy Council of New York were: Orrin Ross, Lowville; Elmer McCann, Chateaugay; R. P. Kinney, Amenia; Clarence Little, Sussex, New Jersey; John Roebuck, Newburgh; John B. Holmway, Amsterdam; and A. Morelle Cheney, Bemus Point. Still to be designated is a member-at-large to represent producers in the State of Pennsylvania who serve the Metropolitan New York market.

# always in trim for the toughest jobs....

# Northeastern Producers have Right to Outlets in Near-by Marketing Areas, Says Dairymen's League

**Claims Federal Government Should Not Bar Plants Under  
New York Federal-State Marketing Orders From  
Supplying Natural Trading Areas**

In an historic move, aimed at protecting the inalienable right of dairy farmers to markets in their natural geographic trading areas, the Dairymen's League presented evidence to the United States Department of Agriculture in a recent hearing. The occasion was the application of Providence, R. I., for a federal milk marketing order.

## Dairymen's League Disapproves the Form of the Providence Order

It is the settled policy of the Dairymen's League to favor government order regulation when needed to correct disorderly market conditions in the interest of producers. But the League did object to the intent of the New England Milk Producers Association to use the Providence order as an economic road block to all but certain favored sources of supply. Under the isolationist and demagogic appeal of "New England milk in New England markets,"—and disregarding entirely the economic disruption which a Chinese Wall of sectional trade barriers always means to everyone concerned—the New England group obviously intended to bar out all Dairymen's League milk, as well as milk produced by other dairymen under the New York City marketing orders.

## League's New England Plants Ship to Providence

For many months, Dairymen's League plants in the New England towns of Rutland, Brandon, and Vergennes in Vermont, and in Great Barrington, Massachusetts, have been shipping milk to Providence where about 90% of the local output is marketed in Class I. It was disclosed in the hearing that Providence requires from 20% to 40% more milk than its own direct delivery producers can supply. In times of shortages Dairymen's League plants in Fort Plain and Cobleskill in New York State have diverted supplies to the Rhode Island City.

## The Issue Is Greater Than the Providence Market

Although Dairymen's League plants in New England have customarily supplied the Providence need for milk, and although they rightfully should claim a place in any arbitrary rule of "New England milk in New England markets," the question at issue is of much greater importance. It is in short: "Do dairy farmers have a right to the natural trade outlets for milk in the communities of their region, or must they be barred by some arbitrary barrier asked for by a self-appointed and self-seeking group. The Dairymen's League gives a ringing answer. It is "Free trade for free farmers in the normal and natural boundaries of their native communities and near-by natural trading areas."

**ASSOCIATION, INC.**

*It's Handy*

## MOVING BRUSH

The other day I had occasion to move a few piles of brush about 20 feet in order to get them far enough away from some good trees before burning the brush. "Two heads are better than one" as the saying goes, and the following idea, which worked like a charm, was the result of another fellow and I pondering the problem.

An ordinary log chain which had a large ring on one end was used. The ring end was dropped down a "hole" made in the middle of the brush pile with a bar. When it had reached the ground, a two-inch pole was pushed under the brush pile and through the ring. The other end of the chain was then hooked to a tractor, and we just pulled the brush pile away.

I don't know how far one can pull such a pile without it falling apart, but I believe if the brush is not all lying piled in the same direction (i.e. is piled criss cross), it could be moved quite a ways. — R. E. Vanderwood, 246 Delaware Ave., Delmar, N. Y.

## KEEPS GATE TIGHT

Here is a sketch (H-585) of an easy way to open and close wire gates and keep the wire tight at all times. It is also a good device for electric fence gates. The curved piece is a shank from an old cultivator.

\* \* \*

## OLD HANDLES

The method I use to take out broken wood handles from hammers, axes, wood chisels, etc., is to put the tool in the oven, and in a few hours they will be dried out and the handles will fall out. The heat is never too hot for the temper.—Robert Blasdel, Perrysburg, New York.

\* \* \*

## PRESERVE PAINT FOR FUTURE USE

Prevent paint from hardening in the can after exposure to the air by pouring a thin layer of turpentine over the surface. Put a bit of the paint in the groove in the friction top of the can also, and then drive the cover down tightly. This seals the can and the paint will not skim over as so often happens if the can is not well sealed.

—Benjamin Hall, Hudson, N. Y.

\* \* \*

## MOVING A BALKY COW

A simple and very effective means of causing a cow to get up quickly when she lies down and refuses to be led or loaded into a truck is that of placing the palms of the hands over her nostrils with fingers under the jaw, tightly enough to stop breathing. It gets immediate action, and is a humane way of getting results. — Mrs. William Besig, R. D. 1, Oriskany, N. Y.

\* \* \*

## LEAKY WATER PIPES

Here is a little help for leaking water pipes until you can secure a plumber.

Moisten ordinary yellow soap and a little whiting into a thick paste and bind it over the leak.—Mrs. Chas. F. Schrader, Elba, N. Y.

## From the Editor's MAILBAG

### REAL NEIGHBORS

I HAVE been a reader of the AMERICAN AGRICULTURIST for a long time and hope to keep on reading it as long as I am able. It made me feel good inside when I read the article "Good Neighbors."

I am enclosing a story taken from the Denton Journal which shows that there are lots of good people in Maryland.—J.W. Krabill, Denton, Ind.

EDITOR'S NOTE: The clipping which Mr. Krabill sent told how dairymen of Queen Anne County banded together to give one day's milk production to a fellow dairyman who lost an arm and leg in a hay baler accident. Jack Laird was the man who was injured and, according to last reports, he was recovering. Even before the "Jack Laird Milk Day" was proposed, some \$400 had been turned over by interested citizens, and the newspaper clipping stated that it was hoped that the total would reach around \$2,000.

Also while Mr. Laird is recovering, a nephew from Baltimore is living on the farm and is carrying on the work with the assistance of neighbors.

—A.A.—

### MORE GOOD NEIGHBORS

AFTER reading in AMERICAN AGRICULTURIST about good neighbors, I want to tell you about the good neighbors I have down here in Salem County, New Jersey. Last year, on May 11, I was ordered to bed by my doctor, and was in bed either here at home or in the hospital for many weeks.

The night before I left for the hospital several of my neighbors came with 3 tractors and a truck, and hauled from town, a mile away, ten tons of fertilizer and sowed it on 20 acres for corn and disked it in before dark.

On Saturday afternoon the same men with tractors and disk harrows prepared the ground, and my nephew, Allen Patrick, who lives four miles away, came with his four-row corn planter and they planted this 20 acres of corn before dark.

When I came home from the hospital on July 29 the corn was up and had been cultivated twice.

What a good feeling it was to know everything was going on at home, I guess better than if I was there. Not only that, but when the call came from the hospital for blood, three carloads of friends responded and gave blood. I wish there was some way I could pay all of these people back.

I am feeling fine now, and doing all of my work again.

—John R. Patrick, Salem, N. J.

EDITOR'S NOTE: No comment is necessary on this fine letter except to say that even in these hurried, complex times there are good neighbors like these in every farm neighborhood.

Sally B. Johnson of Chester, N. Y., and Everett W. Tennant of Smithville Flats, N. Y., winners of the AMERICAN AGRICULTURIST Achievement Award as New York State 4-H Club members. An account of the presentation was given on page 15 of the last issue.

### HOME-GROWN VEGETABLES

I SURELY enjoyed your editorial on buying vegetables, especially after an amusing experience in one of our popular markets one Saturday evening.

We always have a large garden. We raise head lettuce and that difficult-to-raise vegetable called "spinach," as well as the usual ones found in a home garden. Of course we are buying lettuce right now (when the quality and price suit me). On this one particular Saturday evening neither was satisfactory, so I politely said, "I'll be in next week." The clerk gave me a sales talk on the excellent quality of their carrots, which were lovely. I just said, "Oh no, we still have nearly a bushel of crisp ones from our garden." I certainly got the cold, disgusted stare of a good salesman. However, I do want to tell you it made us all feel quite pleased that so much time was spent last summer raising nearly enough vegetables to last until we got fresh ones from our own patch.

Our three oldest youngsters helped; in fact, the two boys worked hard to make their row of corn have nicer ears than Daddy's. Consequently we had nice corn on all rows. Our girl strived for carrots. She had a bushel of nice ones. These youngsters not only pulled weeds but learned to reset turnips and other plants. They are learning to recognize plants, weeds and some common garden pests. They take great pride in having either a can or box for the freezer with their name printed on it to show they helped grow that particular vegetable. These youngsters' ages are 7, 8 and 9.—A Subscriber.

—A.A.—

### A WELL-MANAGED WOODLOT

I AM a young farm boy who enjoys the great outdoors very much. I spend a large amount of my spare time roaming the fields and woodlots of the surrounding farms.

Upon close inspection of the woodlots on these farms, I find that the majority of them are not managed anywhere near the best of the owners' ability.

A number of farmers in this area, and in other areas similar to it, make a practice of grazing livestock in their woodlots. In grazing, the animals kill off many of the small seedlings. I am sure that if these farmers knew that they were destroying cords of firewood each year, they wouldn't graze livestock in their woodlots.

Then there are the farmers who go to all the work of cutting down, sawing up, and piling up a large number of cords of wood. Then they draw about one-half or maybe three-fourths of the wood home and leave the rest to rot.

Mister Woodlot Owner, it will pay you to take better care of your woodlot!

—Norman J. Schueler, Orchard Park, New York.

—A.A.—

### WANTS BOOK

I WOULD appreciate information on the whereabouts of a copy of Anna T. Randall's book "Reading and Elocution" which I may buy. It was used in the New York State Normal Schools as a textbook in 1890, or about that time, along with Dr. Milne's arithmetic which some of you older readers will recall, as Dr. Milne was head of our Geneseo Normal at that time.

I sincerely hope this will locate a copy of the much desired book.—Mrs. Jessie G. Buchanan, Route 2, Geneseo, New York.

New 2-bottom  
close-mounted  
plow with the  
new CA  
Tractor.

**Allis-Chalmers  
Mounted  
Plows Save  
Tractor Power**

Pick-up plow  
and Model B  
Tractor.

Furrows tell the story! See how uniform they are... how clean-cut the furrow-wall!

The secret of the rugged new square-built plow for the CA Tractor is its forward hitchpoint and its free-swinging action. Crowding side-pressure is eliminated... fuel is saved on hillsides and contours. In heavy spots, the new CA's Traction Booster increases weight on the drive wheels for traction to match the load. You're sure of clean plowing and good coverage.

Allis-Chalmers builds a top-notch performer in one-bottom plows, too. It's the quick-hitch, pickup plow for the B or C Tractors. Outstanding features of this economy plow include forward hitchpoint; high clearance; reinforced stress points; mechanical or hydraulic (optional) lift. Ask your A-C dealer for a demonstration.

# POTATO GROWERS

To Be Sure

... of the Outcome

## STAY WITH DITHANE Until Digging Time

- Regular and thorough application of DITHANE will pay dividends from better quality crops.
- It is easier and safer to prevent blight with DITHANE than to stop it once it gets going.
- Do your share and the vines will do theirs—keep them DITHANE-protected until blight danger is past.

Your choice of DITHANE dusts  
or sprays to suit your way

## New Facilities Added to MODEL PEN STABLE At New York State Fair

**T**HE milking parlor of the model pen stabling demonstration at the New York State fairgrounds at Syracuse is being enlarged to provide efficient facilities for milking a herd of from 20 to 40 cows or larger.

A new chute-type milking parlor with four instead of two milking stalls will replace the old "V" shaped arrangements and will be of the design suitable for the average New York state dairy herd, according to Ivan Bigalow and Hollis R. Davis, district agricultural engineers for New York state who are working with Fair Director Harold L. Creal in making the changes.

Construction work will be completed and the new facilities in operation when the State Fair opens Saturday, September 1. The milking room will extend five feet farther north towards the coliseum. The operator will work in a pit, with the milk being carried from the milking machines to tank cooler by a glass pipe milk line.

Other changes underway include provisions for improved observation of the milking operations. Two additional picture-type insulating windows are being added, one at the north end of the milking parlor, and the other between the milking parlor and the loafing area. This will make the milking visible from four sides.

### Cooperative Effort

The model pen stabling demonstration was set up two years ago as a cooperative project on the part of the New York State College of Agriculture, the fair board, a number of New York state agricultural organizations and farm building material manufacturers.

Purpose of the demonstration is to show farmers an economical system of herd housing and management, using a loafing barn with an adjacent feeding barn of pole type construction. The feeder barn is a hay barn accessible from the sides so that cows may eat directly from stacked hay.

The feed area is paved, and requires about 30 square feet per cow. This area is scraped every two or three days with the tractor mounted manure fork. Bedding in the loafing area is allowed to build up, in the wintertime generating heat to help keep the cows warm.

The milking parlor and milk house are of cement block construction, providing insulated walls by the special type of block used. Large windows of insulated glass are placed on the south side with a roof overhang to shut out the hot summer sun high in the sky, yet permit the entry of the heat rays of the winter sun which is lower in the south sky.

Pressure treated poles are used as an economical means of support for the building. The siding and roof are of corrugated metal. Although the milking parlor and milk house walls are insulated, the remainder of the barn is unin-

sulated. The siding is tight to prevent drafts.

Unnecessary travel over the bedded areas is discouraged by providing separate watering and feeding facilities. With the number of milking stalls increased from two to four it now will be possible for one man with two milking machine units to milk from 25 to 30 cows per hour.

### N. Y. EQUIPMENT DEALERS SPONSOR F.F.A. CONTEST

**E**ACH year the New York Farm Equipment Dealers Association sponsors a Tractor Maintenance Contest for New York Future Farmers of America. Any local chapter can enter if 40 per cent of the boys in the class who have tractors on the home farm will participate. There are prizes for winners in various sections, and 8 State awards—4 for \$50 and 4 for \$25.

In addition to the prizes and awards listed in the report of the FFA Convention at Malone which appeared in our June 16 issue, the following were awarded prizes in this contest: Leigh Pittroff, Cato, N. Y.; Walter Wesarg, Red Hook, N. Y.; Harold Jaeger, Jr., Munsville, N. Y.; and John Boyko, North Syracuse, N. Y., won \$50 Bonds. Donald Bowker, Walton, N. Y. and Ronald Brown, Adams Center, N. Y., won \$25 Bonds. In addition, one boy from each F.F.A. Chapter entering the contest gets a one week scholarship to Camp Oswegatchie.

The contest is set up to encourage the use of desirable and improved practices in the operation, maintenance and adjustment of farm tractors and equipment.

— A.A. —

### MASTITIS COSTS MONEY

Good management will keep mastitis out of a dairy herd; but once it is established, management, medication and cattle sales are needed to get rid of it. This disease costs money—it's cheaper to prevent it.

The disease is a management problem, according to V. J. Yates, animal pathologist at the Rhode Island Agricultural Experiment Station. He offers several suggestions for reducing or preventing mastitis troubles in your herd.

1. Rearrange the herd so that the animals are grouped and milked in the following order: first-calf heifers, non-infected, mildly infected, and severely infected animals, as indicated by periodic test.

2. Dispose of unprofitable animals and replace them with first-calf heifers or mastitis free animals.

3. Immediately before milking, wash the udder and teats of each cow with warm disinfectant solution, then dry.

4. Disinfect the teat cups after milking each cow.

5. Practice fast milking and provide one man for each 2 milking units.

6. Detect early and treat properly all injuries to the udder and teats.

# PURINA

## CHECKERBOARD NEWS

*Around the*  
**PURINA**  
**FARM** with  
**ELMER POWELL**

DIRECTOR, RESEARCH DEPT.

Last time I talked to you folks I told you I might have some news in this issue about an old cow that just won't give up. Well, that old cow, our Holstein No. 611, came through again—had her 13th calf and began her 12th lactation. (She had one set of twins.) As of May 1, this old grade cow had given us 170,000 lbs. of milk and she's still being milked three times a day.

\* \* \*

Our Eastern Research Farm is doing a fine job of developing rations especially for the East. For instance, we've had pens of straight run broilers averaging 2¼ lbs. at seven weeks, 4.37 lbs. at twelve weeks, and pens of roasters averaging 5½ lbs. in fourteen weeks.

\* \* \*

I've told you before about how we brought some Razorback sows to the Farm, built them up with Purina, and had them farrow the best litters of their lives. These litters have just been marketed and, in spite of their poor breeding, they averaged over a pound of gain a day from day old to market.

\* \* \*

Ducks are some of the fastest growing things on our Farm. It takes them just about nine weeks to reach 6-6½ lbs. on just about 3-3½ lbs. of feed per pound of gain. They don't waste energy swimming either. All of our ducks are raised on gravel runs . . . Nothing but drinking water for them. Incidentally, livability on 6000 ducks last year was 99.15 per cent.

\* \* \*

Not only do we learn a lot, but we have a lot of fun on our Research Farm trips. For instance, our route around the farm usually takes us from the turkey growing units to the dog and rabbit units. Hugh Dickinson, who's in charge of our research work with turkeys at the Farm, tells his group of visitors as they leave him, "Seems that when folks leave the turkeys, they always go to the dogs."

## New Jersey Father and Son Team Succeeding with Layers and Breeders

By Bruce K. Symonds

A LOT of things can happen to a man trucking eggs into New York City every week for twelve years. And they did to George Lachenmayr who quit the city to run a poultry farm near White House Station, N. J.

One time he was delivering a truckload of eggs in New York and left his small boy, George, Jr., to guard the eggs and truck. Junior, being sales minded, responded to the first customer who came along asking for eggs. As soon as the boy opened the door to wait on the customer, the fellow saw his chance to make off with both the eggs and truck. When Dad returned to find only a wailing boy, he got the cops to help him locate his stolen truck and eggs. They found the truck all right but no eggs. Looking back on the incident, Dad remarked: "Oh well, that was one lot of eggs I didn't have to worry about selling."

George, Jr., has grown up now, studied poultry at Rutgers, and developed a keen interest in breeding poultry. Now the father and son run the farm together. Dad keeps 6,000 White Leghorn and Rhode Island Red layers in the commercial flock. George, Jr., looks

after trap nesting 1,000 White Leghorn pullets and creating a high egg laying strain to supply their own needs and their chick customers.

Speaking about what it takes to make poultry farming pay today, they both agree. "The first thing you've got to have is top-notch stock. That's why we keep our own breeders. The other thing is, you've got to grow hardy replacements to stand up through a long laying year."

To do these two jobs, George and son work together. George, Jr., produces the chicks. Dad tests

Just starting with his trap-nesting program, George, Jr., already has 7 White Leghorn hens qualifying for 300 eggs. Pullets and cockerels from these birds will be the foundation of Lachenmayr's flock.

them out under working conditions. Finds out how well they stand up in the laying pens.

Both father and son are sticklers for clean range rearing. They have 70 acres in bluegrass. At the end of every season shelters are thoroughly cleaned out, sprayed with Purina Insect Oil, and the manure hauled away.

For three years, the Lachenmayrs have fed Purina Chows. Before this they bought feed strictly on the basis of price. They both say hard knocks have taught them this: "Cheap feeds don't save money in the long run. Unless our birds get the very best ingredients, we know we're gambling with troubles in growth, egg production, and hatchability."

Dad's 3 decker laying house holds 6,000 birds. Is equipped with carriers and an elevator for conveying feed to save labor.

## Turkey Broilers Sound Part Time Business for Regular Growers

By Bruce K. Symonds

THE DAYS are fast disappearing when turkey is served only on Thanksgiving and Christmas. More and more of our eastern growers are marketing 11-13 week old, half grown birds, sold as 7-9 lb. broilers. This makes it a year round venture.

Here's how some of the successful growers are fitting turkey broilers into their plans:

Peter Crafts, Grasmere, N. H., fills up his 5,000 bird brooder house whenever market conditions look promising. Poult are started near the boiler room.

He moves them down one pen each week until they are eight weeks old. Then they are debeaked and moved to porches until ready to dress at 12-13 weeks.

New England growers generally prefer White Hollands, but Virginia growers like Billie Le Sueur, Dillwyn, Va., raise Beltville Whites. Le Sueur grows four lots each of 5,000 and four lots of 600 per year. His program calls for marketing toms at 14 weeks, hens at 16 weeks. By using old converted tobacco barns to house his turkeys, he has proved it is not necessary to put a big investment into turkey raising equipment.

Housewives won't put up with bruised or poorly finished birds. Meaty breasts and well developed legs are essential for top prices. These 11 week old White Hollands average 6½ lbs. New York Dressed.

To bring premium prices, on any good market, turkeys must be dressed rapidly, have no abrasions or pin feathers. John and Betty Schaller, Stoughton, Mass., have a practical killing room set up. Customers like quality of their birds.

Raymond and Mary Reed, Andover, Mass., sell White Hollands ranging from 7½ to 9½ lbs. New York dressed at 13 weeks. The Reeds cater to family buyers who appreciate top quality. They make the most of attractive packaging to sell their birds. Their customers are very fond of these "apartment size turkeys", and come back for more. Like the other sound turkey broiler growers, the Reeds have a regular crop of holiday birds. They just raise the broilers as a profitable sideline.

## Saving Turkeys for Market

by HOLLIS BROWER  
Manager, Purina Turkey Chows

Your turkeys are pretty well started by now. From now on, every death loss will be extra costly . . . for you not only lose the value of the poult but an increasing amount of labor and feed as well.

Your best bet for keeping death losses down is to keep things clean.

Here are a few reminders that may help you cut mortalities.

For one thing, make sure feeders and waterers are built so that droppings can't get in them. Keep plenty of clean water available at all times.

If your turkeys are on range, change location of feeders and waterers every few days. Success with turkeys on range is pretty well dependent on keeping them away from damp ground and accumulation of droppings.

Also be sure your range is free from contamination . . . don't move turkeys to a range that has been occupied recently by chickens or blackhead-infected turkeys.

Watch birds daily and remove those that are not normal. Be particularly alert for blackhead, typhoid, paratyphoid, and cholera. In case of an outbreak of blackhead, use medicated Purina Turkey Chows or Purina Blackhead Control (for use in drinking water).

In the long run, you'll find there is no substitute for a good sanitation program. If you keep things clean, you've gone a long way toward getting your turkeys to market.

## Are Your Cows Losing Weight?

by A. H. LEONARD  
Manager, Purina Dairy Chows

Have you put your cows on a weight reduction diet? If you have, you can expect the reduction to carry down to your milk check.

Both practical experience and research have many times shown that each pound of condition gained by a cow while dry adds about twenty pounds of milk during her next lactation.

Most dairymen have seen this work in reverse, especially late in the summer. Maybe the first thing they notice is a dropping off in production. But isn't the drop in milk almost always preceded by a drop in body weight?

I know dairymen who throw a weight tape around their heavy milkers each week starting about the middle of the summer. If a cow loses as little as ten pounds they regard it as a danger signal and start doing something about it quick.

In addition to supplying some extra body feed at a time when pasture seems to lose much of its punch, the cows fed Bulky Las seem to make better use of their feed. Just a gallon of Bulky Las fed night and morning will usually do the trick, but if it takes a little more to keep your cows from taking a weight reducing, milk reducing plunge you'll find it's worth a lot.

Milk gets second call. The cow will cut back on milk as the calf embryo's need builds up—unless she gets the full amount in her ration.

The cow's body gets last consideration by Mother Nature. If the daily feed does not supply all needs for embryo, milk and body,

## PURINA RESEARCH PHOTOS OF CALF EMBRYO GROWTH

## Calf Embryo Study Shows WHY COWS BREAK DOWN...

PURINA RESEARCH has just completed a study of calf embryo growth. Heifers at every stage of gestation from one month to 9 months were slaughtered. The embryos were removed and carefully weighed and photographed.

As you can judge from the pictures, the rapid growth of the embryo must call for a tremendous lot of food. Mother Nature's first law is reproduction of the species. So the calf embryo gets first call on necessary feed nutrients to keep alive and growing.

Milk gets second call. The cow will cut back on milk as the calf embryo's need builds up—unless she gets the full amount in her ration.

The cow's body gets last consideration by Mother Nature. If the daily feed does not supply all needs for embryo, milk and body,

the cow takes for her body just enough to keep living and moving. Indeed, when there is a shortage of nutrients, she actually robs her own bones, meat and even her blood to feed the developing embryo and make some milk. And what a waste of the dairyman's money this is!

Because we believe that long life is just as necessary as good production, our Research Farm studies are directed toward supplying the cow with all the nutrients she needs for the three big jobs—calf embryo . . . heavy milk flow . . . good body condition. These studies have led to many improvements in Purina milking chows and Purina dry cow rations.

SEE THESE PICTURES IN COLOR—Purina Research has prepared a film showing 40 pictures of calf embryo development in full natural color. Your Purina Dealer will have a free showing some time this fall. Ask him when. He'll be glad to have you.

Here the wall of the uterus was cut and the calf lifted out to show the cotyledons or "buttons" that attach to the inner lining of the uterus. These buttons are the connectors that take blood from the mother and send it through the navel cord to the calf. Thus the embryo is fed.

## CUSTOM MIX MIKE SEZ:

SINCE SMALL GRAINS NOW ARE HARVESTED, YOU'LL WANT TO FIND A PLAN TO TURN 'EM INTO MEAT, MILK, EGGS AS CHEAPLY AS YOU CAN.

OUR GOOD PURINA CONCENTRATES MIXED RIGHT WITH YOUR GROUND GRAIN CAN HELP PRODUCE MORE MILK AND EGGS AND CHEAPER POUNDS OF GAIN!

## FARM HANDIES

## FEEDERS ON ROOSTS

Hanes, N. C.—Joe Bullin keeps a couple of feeders on his roosts for the benefit of timid birds. He says certain birds spend a lot of time on the roosts and will eat more if feed is handy.

Joe uses pit roosts that hold droppings for several months. He has to clean only two or three times a year.

**How's the Egg Market?** What are they paying for roasters? What are broiler prices? What's the weather outlook? Folks in Jersey and the Delmarva area get the answers to these questions every weekday on the Purina Poultry Hour over WWBZ, Vineland, N. J.

**Fred Wood** is the radio personality behind the Purina Poultry Hour, a review of the latest markets, weather and poultry features, heard at 12:35 to 1:00 p.m. In addition to these regular features, Fred also interviews poultry and market experts to help keep you informed of what's going on in the industry.

**Listen to Fred Wood** and the Purina Poultry Hour for news and services especially for poultrymen.

## An Experiment in LINE BREEDING

By WILLIAM GILMAN

**I**F YOU'VE heard less lately about Robert E. Eddy, that's because he calls himself "semi-retired." Not retired completely — Bob confesses he wouldn't feel right without a promising bull and few likely heifers on the place. It's from his modest Holstein farm near Poultney, Vt., that Gold Medal bulls and world's champion milkers came. Most famed was Ormsby Sensation 45th, and Bob's been using that bloodline exclusively since 1930. His dispersal sale was in 1947, but he has continued intensive line breeding as a hobby.

Young bull shown above with Bob is Newmont Aristocrat Dean, a product of brother-sister mating. With 14 crosses back to "45th", he's 36% of that famed sire. Dean, though yet to be proven, strikes Eddy as "as good a bull as I've ever had." Last year, Dean's heifer offspring took "get of sire" award at the Rutland Fair, and Dean himself has taken top honors since calfhood. One of his latest progeny is a fine young heifer resulting from mating inbred Dean with a half-sister.

Concerning such breeding, Eddy says, "I haven't seen a single reason yet why I should discontinue the experiment. I've not had to discard a single animal because of inferiority of any kind."

Purpose of Robert Eddy's hobby is to see how closely he can linebreed and get away with it. (Remember the controversial article, "Inbreed 'em and Weep, Outbreed 'em and Reap," in the June 18, 1949 issue of AMERICAN AGRICULTURIST?) Behind the experiment has been Bob's practical desire to "pro-

duce cows more uniform in type, production and reproduction dependability than can be obtained any other way."

Photo below shows Osborne Halsted with a row of 2-year-old heifers almost as uniform in appearance as peas in a pod. They're from the "45th" line and have been bred back into it. On his farm near Pawlet, Vt., Halsted built up an entire herd rich in "45th" blood, some directly from Eddy's herd, some by way of the New Jersey Experiment Station where such of Eddy's famed bulls as Newmont Aristocrat and "Old 45th" himself went to head breeding programs.

Prof. J. W. Bartlett, Dairy Industry Department head there, estimates that "45th" now has 200,000 descendants in at least 25 states."

—A.A.—

### CITRUS WASTE FOR COW FEED

The U. S. Department of Agriculture recently pointed out that waste from citrus canneries is a potentially large source of livestock feed. About 2½ million tons of this waste is produced every year.

At the Florida Experiment Station steers which were fed dried citrus pulp as 50% of their ration, gained 2.17 pounds a day and required 466 pounds of total digestible nutrients for 100 pounds gain showing relatively high feed efficiency. Good gains were made on 5 to 7 pounds of hay, 3 pounds of cottonseed meal and 8 to 9 pounds of dried citrus pulp.

## SEE THE NEW FERGUSON SIDE-DELIVERY RAKE

Moves hay gently.. AND FAST!

True "sideward" raking action with the unique Ferguson six-bar offset reel moves hay 50 per cent less distance from swath to windrow. Tractor-mounted... power take-off driven... Finger Tip Controlled. Surprisingly low in price.

## You Get HIGH CONCEPTION

by Breeding  
to NYABC SIRES

Fewer involuntary dry days, with more than seven out of ten cows on the average conceiving on first service to NYABC sires. Service throughout New York and Western Vermont.

For information, write today to:

**NYABC**  
New York Artificial Breeders' Cooperative

Box 528 A Inc. Ithaca, N. Y.

"I can't afford  
to have my  
horse laid up"

says Norwood Andrews  
of Moorestown, N. J.

● "Whenever I see any signs of lameness on my horses, I use Absorbine for relief. I'm sure it saved me many working hours in the past 10 years."

There's nothing like Absorbine for lameness due to strains, puffs, bruises. It's not a "cure-all," but a time-proved help in relieving fresh bog spavin, windgall and similar congestive troubles.

A stand-by for over 50 years, it's used by many leading veterinarians. Will not blister or remove hair. Only \$2.50 at all druggists.

W. F. Young, Inc., Springfield, Mass.

## ABSORBINE

## Get Rid of Flies with the "Sentry" Fly Trap!

Place 50-100 ft. from door — bait with food scraps — empty every two weeks — It's that simple!

You will catch them by the BUSHELS in this large outdoor trap because of its size... and because of their natural attraction to food scraps.

The "Sentry" is most efficient when placed 50-100 feet from building — stops these germ-carrying pests BEFORE they get to doors and porches. Scientifically made — all steel — rust-proofed.

Used for 20 years at homes, dairy barns, poultry farms, canneries, summer and army camps, etc.

Thousands of pleased customers testify to this PROVEN method of fly control because... 1. Stops flies BEFORE they get to doors. 2. Saves time and money on costly sprays. 3. Lasts for many years—30 bu. of flies is the average catch during life of trap.

SHIPPED PREPAID—Only \$5.50—three for \$16—six for \$30. Bait pan and easy instructions included with each trap. Send Check or Money Order Today—say "good-bye" to flies!

Two weeks catch in fly infested area — nearly one-half bushel.

BATH METAL PRODUCTS COMPANY Box 22 Bath, New York

**ADVERTISING RATES**—10 cents per word, initial or group of numerals. Example, J. S. Jones, 100 Main Rd., Anywhere, N. Y. Phone Anywhere 13R24 counts as 12 words. Minimum \$1.00. Send check or money order to AMERICAN AGRICULTURIST, P. O. Box 514, ITHACA, N. Y. Advance payment is required.

## FARM PAPERS CITED BY A. D. A.

At the Dairy Rally Banquet of the American Dairy Association at Syracuse, July 17, several farm papers were cited for their support given to the A.D.A. milk advertising program. The publications cited were: AMERICAN AGRICULTURIST, the Dairymen's League News, the Metropolitan Milk Producers News, the New York State Guernsey Breeders News, the Connecticut Milk Producers Association News, and the Eastern Milk Producers.

Dr. Herrell DeGraff of Cornell told those attending the meeting that the nation's dairy industry must expand if all people are to have the minimum dairy foods recommended for good nutrition.

# BABCOCK'S HEALTHY CHICKS

MAKE GREAT LAYERS

At the 1950 Storrs Conn. Egg Laying Test, our White Leghorns won first all breeds, with 3899 eggs and 4124.5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the all-time World's record for all breeds, all tests won in 1944-45.

**WE HATCH THE YEAR ROUND**  
White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks. We own two hatcheries with 600,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

**SEND FOR FREE CATALOG**  
This 36-page illustrated catalog describes our breeding program. Write today for your free copy.

## DOWN THE

By J. F. "Doc" ROBERTS

**O**UR livestock situation is rapidly clearing up as of now (July 15). Every move of Congress to throw out price controls is a blow to blackmarketeers; shortages to consumers vanish and livestock and meat prices level out. Probably everyone has noticed this.

I now anticipate that livestock prices will work out on a slightly lower basis, especially through the fall months, probably to a level even a little lower than present so-called "ceilings" but without their destructive false grading, quotas, rollbacks, and blackmarkets.

Think of the increased costs, the headaches, the higher prices we have been through just because of politics and politicians!

We as farmers have production problems, but they can now be worked out. An abundant hay crop (most of which got wet) is always a livestock boon here in the Northeast. With it, heifers, breeding sheep and beef cattle will make their way if politics do not interfere. Poor hay in a growing or feeding operation (not making milk) will work out by simply feeding more of it and allowing these animals to pick and choose, using at least 20 per cent they leave as bedding. There is nothing so sure in Northeastern farming—if you have the rough feed—as making "big ones out of little ones."

### More Folks

Young stock or replacement stock is high, but there is nothing in the picture to indicate it will get enough lower to

hurt you, particularly if it is the growing kind. We are still behind population increases with available or growing livestock.

Generally speaking, increasing numbers should be with the animals you know about and with which you have had experience. This applies particularly to dairymen and hog raisers. Beef cattle, at first, can be handled by dairymen, and a small flock of ewes can and should be on most Northeast farms.

### Silo Is Full

Grass silage certainly got a boost this year. I expect my experience is similar to many others. We started putting grass in our silo the latter part of May, with the idea of stopping as soon as the weather broke, then haying it, and then finish filling the silo with corn this fall. Before the fifth of June our silo was full and the weather had not broken so that we could hay. But, as I said above, we are doing everything we can in spite of the weather to fill up with rough feed.

From a long-time standpoint I think, sadly, that we should take much "peace talk" with a grain of salt as long as Russia is controlled by the same individuals. I also think the "parity price" talk on beef should be forgotten. Since 1910-1914, on which parity is based, conditions have changed. The cost, for example, of producing and harvesting a bushel of wheat in the West has been reduced greatly. With our livestock it still takes a papa and a mamma, and many months, to produce a mature animal at greatly increased costs. Therefore, to say that wheat is below parity and beef 152 per cent above parity is out of order and not an expression of true facts or conditions, and it is misleading to a great many people.

We have come a long way recently. Keep up your bombardment of Congress to come all the way out of controls. Then again we can set our feet on good solid American ground.

## AN UNUSUAL HENHOUSE

**T**HE octagonal-shaped poultry house shown above was built by Llewellyn Hubbard on his 37-acre place near Bainbridge, N. Y., with the assistance of his father-in-law, Frank Lewis, who is a building contractor.

Completed last summer, the unusual building accommodates 2,000 White Leghorn layers in its 11,000 square feet. It is built so that Llewellyn can drive around inside all the pens with a tractor. One of the "piece of pie"-shaped sections serves as a feed room for the 7 sections housing the hens.

The windows all around the building give ideal summer ventilation with the help of the vents in the roof, but Mr. Hubbard finds that he needs two fans to keep the building properly ventilated in winter.

Mr. Hubbard finds the building efficient enough to let him work all day for his father-in-law away from the farm, and handle the poultry work morning and night without too much effort.

In addition to looking after the birds and the thousand Red Rock chicks he started in March for replacements, Mr. Hubbard raises his own wheat for the

hens, plus fresh market snap beans. Both his eggs and beans are shipped to New York City.

## For Classes or Careers

By MABEL HEBEL

**W**ITH school days just a month or so away, it's time to begin thinking of what they'll wear on that important first day and all the other days that follow. On this page you'll find the newest in Fall fashions — either for lassies in classes or for career girls.

"Feminine" is the word used in speaking of this Fall's styles, both in design and detail. Fullness is controlled to look sleek—with unpressed pleats providing skirt width. Casuals have a well-groomed air, and separates team up with many wardrobe items. Jumpers are staging a big comeback as styles worn with or without a blouse. Suits round hiplines over the still-slim-but-relieved skirt.

Flannel in brown and deep Oxford gray is again favored, and lightweight corduroy goes to parties with glitter touches. Plaid is new in tweedy weaves, in orangy-red grounds, in purple, in wine-and-green, or cocoa-and-black. Velveteen is good by itself or with flannel. Basic wool jersey mixes its colors and has velvet, braid or corduroy trim.

The season's popular unpressed pleats soften dress No. 2507 and make it smart for almost any time of day. Cuffed sleeves are cut-in-one with bodice for simple sewing.

No. 2559 is the new diagonal buttoned jumper or dress—depending on whether or not it is worn with its casual blouse!

Another outstanding double duty outfit is No. 2258. It can serve as a bare top dress for dates, or as a jumper, teamed with the blouse. Its soft lines take well to dressy velveteen, taffeta, faille.

Keyhole neck blouse No. 2511 cuts from 1 yard of 54-inch fabric in any of its sizes—wonderful idea for basic wool jersey! Its cap sleeve version is very new in plaid cotton-with-a-crisp-worsted look.

Neatly tailored with notched collar, topper No. 2405 goes with skirt and blouse teams or over a dress—in tweed, corduroy, plaid woolens, camel's hair, new poodle cloth.

More minimum-material magic — No. 2261. It's a slim skirt made from a mere

(Continued on Opposite Page)

# Serve Squash These Ways

By RUBY PRICE WEEKS

**E**VERY housewife is familiar with the crook-neck or yellow summer squash, but when it comes to zucchini (the oblong green-and-white striped squash, sometimes called Italian squash or vegetable marrow), many women think they know little regarding cooking it. But this variety and the patty pan (which resembles an inverted bell with a scalloped edge), as well as the crook-neck, are all easy to prepare, either boiled or served in more unusual ways.

## BOILED SQUASH

If young and tender, the squash need not be peeled or the seeds removed. Slice or dice and cook in boiling salted water for 10 to 15 minutes. Drain, season with melted butter, and serve.

## SUMMER SQUASH AND ONIONS

Wash, peel, and remove seeds from two summer squash and dice them. (There should be about two cups.) Melt  $\frac{1}{4}$  cup butter and saute 1 cup of minced onion until light brown. Add squash, 1 teaspoon salt,  $\frac{1}{4}$  teaspoon pepper, cover pan and cook slowly without stirring for ten minutes. Cook 30 minutes longer, stirring occasionally. Serve with a sprinkling of paprika. Serves 4.

## SQUASH WITH MEAT STUFFING

Cut three summer squash in half, lengthwise. Cook in a small amount of salted water for 5 minutes. Drain and remove centers. Place squash shells in shallow, well-oiled baking dish. Prepare 3 cups of stuffing (a half-and-half mixture of mashed potatoes and sauted sausages is good for this) and fill squash shells. Sprinkle top with buttered cracker crumbs. Bake in moderately hot oven (375° F.) for 30 minutes. Serve with tomato sauce and garnish with parsley. Serves 6.

## FRIED ZUCCHINI

Slice desired amount of squash, dip in batter, and fry in deep fat in which an inch cube of day-old bread will brown in about a minute. To make batter, combine 2 egg yolks,  $\frac{3}{4}$  cup of milk, 1 tablespoon lemon juice, 1 tablespoon melted butter, 1 cup flour,  $\frac{1}{2}$

teaspoon salt, and 2 tablespoons sugar; fold into this mixture 2 egg whites beaten till stiff.

## ACORN SQUASH WITH APPLES AND SAUSAGE

Wash and split lengthwise three squash. Remove seeds. Sprinkle with salt, pepper and dot with butter. Peel and core three cooking apples, cut in halves. Put one half in hollow of each

## AUGUST

By Alma Robison Higbee

A soft wind blows away the chaff of summer  
And leaves the gold of sunlight on the land;  
The quail is hidden in the thistle shadow  
For the thrasher's song is harsh on every hand;  
And while its raucous thunder shakes the maples  
And the green leaves hold a rusty tinge of dust,  
Swift hands are garnering bright coins of summer  
To hold in barns and bins for winter's trust.

squash. Sprinkle with sugar. Place in baking pan. Add small amount of water, cover and bake in hot oven (400° F.) for about 1 hour or until tender. Brown 12 small sausages, place 2 on each squash, encircling the apple. Place in oven and bake 15 minutes longer. Serves 6.

## FOR CLASSES OR CAREERS

(Continued from Opposite Page)

yard of 54-inch in any of its sizes, with or without fake pockets. Sew several in the fabrics stressed for fall—from tweed to flannel.

Classroom casual No. 2473 is done in a different way—with simulated weskit lines! Finish as a short sleeve gingham (newest gingham has darkish colors on bright grounds) or as a long sleeve wool.

Send daughter back to studies in a clan plaid jumper featuring panel and pocket treatment. No. 2494 comes with its own convertible collared blouse!

A small amount of material and sewing time makes sturdy three-piece ensemble No. 2512. Flared jumper, matching high button bolero-jacket, puff sleeve blouse.

No. 2526 is a midriff dress with a new slant on pockets—to make in dark schoolroom plaid or pretty party fabric. Panties, too.

Easy to make and fun to mix-match are the three separates included in No. 2471. This pleat-eased skirt and two weskit versions are typical of the new "independent" separates that can team with other wardrobe items, too.

Softness cues the casual lines of No. 3044. Its deep collar is different, slenderizing. Shirred front skirt is supple, feminine.

## PATTERN SIZES AND REQUIREMENTS

No. 2258—10-20; size 16 jumper, 3 yds. 39-in. Blouse, 2 $\frac{3}{4}$  yds. 39-in., with  $\frac{7}{8}$  yd. ruffling.  
No. 2261—Waist sizes 22-30; skirt in any of its sizes takes only 1 yd. 54-in.  
No. 2405—12-20; 36-44; size 18, 2 $\frac{3}{4}$  yds. 54-in.  
No. 2471—10-20; 36-40; size 16 skirt, 1 $\frac{1}{2}$  yds. 54-in. Either weskit version, 1 yd. 54-in. fabric.  
No. 2473—6-14; size 8, 2 $\frac{1}{2}$  yds. 35-in.  
No. 2494—6-14; size 8 jumper, 1 $\frac{1}{2}$  yds. 54-in. Blouse, 1 $\frac{1}{2}$  yds. 35-in.  
No. 2507—12-20; 36-42; size 18, 3 $\frac{3}{8}$  yds. 39-in.  
No. 2511—10-18; three-quarter sleeve

blouse takes 1 yd. 54-in. in any of its sizes. Cap sleeve blouse takes 1 $\frac{1}{4}$  yds. 35-in. or 39-in. in size 16.

No. 2512—2-8; size 4 jumper and jacket, 1 $\frac{1}{2}$  yds. 54-in.; jumper alone, 1 yd. 54-in.; blouse, 1 $\frac{1}{8}$  yds. 35-in.

No. 2526—2-8; size 4 puff sleeve dress, 2 yds. 35-in. plaid; angel sleeve dress, 1 $\frac{7}{8}$  yds. 35-in., 3 $\frac{3}{8}$  yds. ric rac. Panties,  $\frac{3}{4}$  yd. 35-in.

No. 2559—9-17; size 13 jumper, 2 $\frac{1}{2}$  yds. 54-in.; blouse, 2 $\frac{1}{4}$  yds. 39-in.

No. 3044—12-20; 36-40; size 16, 3 $\frac{3}{8}$  yds. 39-in.

## WHAT'S GONE BEFORE

The day after his marriage to Ann Clinton, Mark Wilson leaves to join Lincoln's volunteers. His brother, Charlie, and his father, George Wilson, follow him into the Army; also Ann's father, Fred Clinton. Ann receives news that Mark has been killed in the Battle of Fredericksburg and in her grief becomes indifferent to everything. Henry Bain, a neighboring farmer who holds the mortgage on the Clinton farm, persuades Ann to marry him for her mother's sake. Henry Bain is a Copperhead and against the Union side, but Ann continues to work as well as she can for the Union army. A disastrous fire occurs on property owned by Bain during his absence, and when he returns and hears of it he tells Ann that he is sure the fire was set.

## CHAPTER XXIV

CHRISTMAS was anything but a joyous occasion in war-torn America in the winter of 1863. But although Nancy's heart wasn't in it, she felt that she owed it to the little girls to have a Christmas tree and decorate it, as they had always done, with strings of popcorn. She had found time to knit stockings and mittens and had managed to buy a few little trinkets from John Crawford's store. But funds were growing shorter all of the time, and it was necessary to make every cent count toward the things they had to have to live.

Then, too, how could there be any real Christmas spirit, any real enthusiasm, she asked herself, with Mark gone out of their lives forever, and her husband and Charlie far away in a dismal war camp with little hope that they would be home in a long time, if ever. Yet it might not be so long, after all, she thought, more hopefully. There were some indications that the South was weakening—the great victory at Gettysburg back in July, and the other victory by that man Grant when he captured Vicksburg on the Fourth of July and cleared the Mississippi of the Rebels for its entire length. Yes, the news did actually seem to be better. Only a month back, on November 23, Hooker had defeated the Confederate leader Bragg at Lookout Mountain in "the battle above the clouds." She was thrilled when she had read how the boys in blue had charged up an almost inaccessible mountainside to throw the enemy out.

Anyway, sad or glad, life must go on. There was Tom. What a fine boy he had become! And Ellen, Elizabeth and Hattie tried so hard to be helpful. Yes, no matter what happened, it was her job to take care of them, and as she thought how meager their Christmas would be, and how hard it was even to provide enough clothes and shoes for all of them, her heart filled and she chided herself for not doing a better job. All summer long, until the frost lay on the ground, the girls had gone barefoot in order to save shoes, and now, in the winter when they were not in school, they removed their shoes just the moment they got into the house.

Thank God for the children, she thought. How lonesome it was on week days when Tom and Ellen and Elizabeth went down the road to attend the nearby district school, leaving only Hattie at home out of her whole brood. "How lonely it must be," she reflected, "for mothers of large families when the

children grow up almost overnight and go away to live their own lives. How they must wish again for those years of being busy and happy, and even for the times when they were nervous and irritated by all the work and worry and noise that the children made."

Then she laughed aloud as she thought of some of the scrapes the children were constantly getting into, frightening and irritating at the time they happened, but funny in retrospect. Just the other day Ellen had climbed up into the hayloft, and somehow or other managed to fall through an opening in the floor on to one of the old cows in the stall below. Difficult, indeed, was it to tell which made the loudest noise or which was the more scared—Ellen or the bawling cow. When Enoch, busy at his chores nearby, heard the rumpus and came running, there was Ellen astraddle the cow and hanging on for dear life, while the cow was doing her utmost to buck her off.

Nancy chuckled to herself as she recalled Ellen's injured dignity, and then her thoughts went back to the time last summer when the girls got to quarreling down near the brook. Ellen got Hattie's head under water and probably would have drowned her if Elizabeth hadn't knocked her off.

Well, maybe there was some purpose after all in fixing up the Christmas tree, and trying one's best to be happy and to make others happy no matter what came. Someone said that it was always darkest just before dawn. Maybe it would be that way now.

Then Nancy's thoughts turned to

Mary Curtis and Enoch Payne. On her urgent invitation these two had come to live with her some weeks before. Welcoming the opportunity to be near one another, they had needed no second invitation. In addition to all the work they both did in the barn and in the house, what a blessing they were to the children and to herself with their cheerful, kindly dispositions.

Pondering over them, Nancy was puzzled as to why they didn't marry, for if she was any judge they certainly were in love. She laughed to herself as she thought how shy and awkward either was when the other came around. That was the reason, probably, Enoch just couldn't get up courage to pop the question.

But just the day before Christmas, when the children were out playing in the snow, Enoch and Mary came and stood awkwardly before Nancy to tell her their glad news. Evidently the Christmas spirit had given Enoch the courage to ask her to marry him.

"I knew it! I knew it!" Nancy laughed. "I think I knew before either of you. And I'm so glad."

Indeed, Nancy was happier than she had been in many a day.

"And now, we must plan the wedding!" she said, gaily.

Enoch ran his fingers through his hair, shifted from one foot to the other, and finally said:

"Well, Nancy, this is the nearest to home either of us have. We've talked it over. We've waited a long time for marriage, and now we'd sorta like to be married right here in this house."

"That's wonderful," said Nancy, "and it makes me very happy. I've been worrying about Christmas, for as you know, the happiest occasions in the past can be the saddest when the anniversaries roll around again and loved ones are absent. Why don't we make Christmas Day your wedding day, right here tomorrow?"

Mary looked a little startled, but Enoch nodded vigorous approval, and then Mary, glancing up at him, her shyness forgotten, stepped closer and slipped her arm through his and said:

"Nancy, I think that would just top off our happiness."

"Well, now, we've certainly got

something," Nancy agreed, her eyes shining. Then, becoming practical, she said, crisply:

"There's work to be done."

On the afternoon of Christmas Day the walls of the sitting-room in the Wilson home were almost covered with the green boughs of the evergreens brought fresh from the woods, and the room was rich with their fragrance. Chunks burned in the big box stove. There had been no time to send out formal invitations, but word had got around, and a good many friends of Mary and Enoch—who had spent most of their lives working for others—now filled the room to give them a real send-off down their own road to happiness.

When Enoch and Mary stood with Pastor Belden in front of the mantel where the old clock, flanked by a little stone dog on each side, ticked away the hours, it seemed to Nancy that everyone crowded into that room was holding his breath, for when this middle-aged man and woman, their faces strained with deep emotion, gave their promises one to the other, there wasn't a dry eye among the women in the room, and even the men were conscious of lumps in their throats. These were strange, confused, uncertain times. No one knew what lay ahead, but as they watched Mary and Enoch, all realized that somehow, no matter what happened, love and life are eternal.

Not the least of the joys of the occasion to Nancy and to the bride and groom was the fact that Ann came to the wedding. But some of Nancy's happiness in having Ann present was offset by her feeling that the other guests drew away from her. Maybe she only imagined it, thought Nancy, but she took care to go over and stand by Ann, and she reached for her hand during the ceremony. Ann responded with a little squeeze of her hand, but after the ceremony had ended and she had warmly congratulated Mary and Enoch, she immediately slipped away.

\* \* \*

Though the weather grew colder after Christmas, it was easier to be cheerful and optimistic because the days were soon noticeably longer. It was still winter, but when they could eat supper and breakfast by daylight, it gave Nancy the feeling that another spring and summer were not too far away. Many, many times she thought how lucky she was to have Mary and Enoch make their home with her. Even though she knew that eventually they would want to have a home of their own, there was a feeling of security in just having the solid, substantial couple around, and Nancy came closer to being happy than she had been since George and her boys had gone away and the news of Mark's death had come.

The war news was better, too. Although there was no fighting in the winter, the North had been cheered by Lincoln's appointment of Ulysses S. Grant, the victorious general in the West, as commander now of all the Union forces. At last maybe they had found a general who would stand and fight. The people were in agreement with their President when he said, "Wherever Grant is, things move."

Ann's attendance at the wedding had broken the ice and given Nancy an opportunity to renew their friendship. Several times during the winter Nancy visited her, and Ann again formed the habit of dropping in occasionally on Nancy.

When the sap began to run, it kept all of them busy. One night when the tubs of sap were all full, Mary and Enoch spent most of the night in the warm, steamy, fragrant sugar house boiling the sap. During the evening, as they sat before the glowing fire in the furnace, Nancy and Ann walked in. At first the four of them sat in the

## NO DRUMS

(Continued from Opposite Page)

quiet companionship of long-time friends, gazing at the fire and listening to the boiling sap. To Nancy it seemed so good to be on friendly terms again with Ann. But it was soon evident that Ann herself was not relaxed, and that she had something disquieting on her mind. After a while she said:

"I'm worried, terribly worried. I haven't anyone to talk to except you three, for no one else would understand."

She fell silent, and Nancy said:

"Of course, you can talk to us, dear. What's the matter?"

"Well—" Ann hesitated, trying to find words. "It's Henry! I know I oughtn't to say this even to you, but maybe you can tell me what to do."

Nancy thought:

"Poor girl! She's only a child yet, and doesn't know that there are some situations we get ourselves into for which there just isn't anything to do, except to endure them."

Ann was talking in such a low tone that all three of them had to listen intently to catch her voice above the crackling of the fire.

"That time when we had the big woods fire, Henry wasn't here. I don't know where he was. I don't know where he goes. But when he came back he was terribly excited about the loss of all the buildings and so much fine timber."

"That was natural," said Enoch. "It was a big loss. We all hated to see those good trees go."

"But, listen," she begged. "Henry thought that fire was set purposely."

"Oh, no!" Nancy exclaimed.

"Yes, that's what he thought. It didn't seem possible at first to me that anyone would do such a thing, but I've been thinking about it since, and now I wonder."

"Does Henry have any evidence?" Enoch asked.

Ann hesitated as if afraid of saying anything further, then added:

"Yes, he has this: Only a few nights before the fire, some masked men came to the door. When he came back upstairs after talking with them, he was shaking all over, and he said the men had warned him to get out of the county or else they'd put him out."

The girl stopped speaking, and the other sat quietly, knowing how much Henry Bain was hated by most of his neighbors. Then Ann spoke again:

"We all know how dry it was at the time of the fire, but as I think about it, I remember that the line of fire extended at least a mile and a half. So it couldn't have started from some careless woodchopper's one fire. It must have been set in several places!"

Enoch nodded his head, and said:

"Yes, I thought of that, too. And I'll say this: If one or more persons did set a fire like that, even though they hated your husband, they ought to be shot for destroying good property and endangering the lives of innocent people."

Ann gave him a grateful smile.

"There's more that I've got to get off my heart," she said. "You know how anxious I am about this war, and I've tried to help. I've been trying to work with the other women to make things for the soldiers." Her voice faltered. "But it's so hard. They — don't like me. Even some of my old friends won't speak to me."

Nancy put out a hand to clasp Ann's.

"Don't you fret, dear," she said. "Your real friends love you. Everybody is upset and unreasonable in these times. They'll get over it."

"But maybe they're right," Ann protested, now almost in tears. "Henry does say the awfulest things about Mr. Lincoln and our soldiers, and he does go away and I don't know where he goes, and —" she added, "I am his wife."

Enoch stood up, threw some more wood on the fire, and went around the side to test the sirup boiling in the pan. Then he came back to stand in front of the little group, his hands in his pockets and his shoulders thrown back. As he stood there, Nancy thought him the embodiment of masculinity, courage and gentleness.

"Ann," he said, "don't worry too much. As Nancy says, people are upset now. This war is going to be over before too long, and things will quiet down. No matter how strongly anyone is for the Union and against Henry Bain, no good citizen is going to stand for any more criminal acts like burning the woods and buildings."

He refrained from voicing his own belief that if Henry Bain didn't watch his step, just the strength of public opinion would force him to leave the county. Nor did he know how to give Ann any real comfort for the mistake she had made in marrying a man like that. So he reached down, took her hands, and pulled her to her feet, saying:

"Come on, Ann. I'll walk you home, while Mary and Nancy watch the fire."

One afternoon on her way home after a visit with Nancy, Ann branched off from the direct road home and found a sheltered spot back of a clump of bushes, out of the spring wind, and there she sat in the sunshine for a long time, thinking over her relationship with her husband, their relations with their neighbors, and wondering what, if anything, she could do to ease things. "Maybe," she thought hopefully, "Henry is on the way to solving our problems himself." For several weeks now—in fact, since he had received that warning from those masked men—he had been absent from home very little, only once or twice, and then, so far as she knew, his trips had been confined to visiting and managing his many pieces of property in the other end of the county.

Only a week or so ago he had surprised Ann by bringing up the subject of her doing war work with the other women of the neighborhood, remarking that he had noticed she hadn't been attending the meetings lately.

"Why is that?" he had asked.

He had seemed sincere, too, when he added:

"Don't let me stop you. Maybe you should help."

There had been several times lately, also, when Henry had gone out of his way to speak more kindly about Lincoln and to express satisfaction at the recent Union victories. Nancy had mentioned to Ann, too, that Enoch Payne had reported the surprise of some of the men in John Crawford's store when Henry had expressed favorable sentiments toward the Union cause. Nancy had passed this information on to Ann with the hope that it would comfort her.

Now, adding it all up, Ann, with a guilty feeling of disloyalty to her husband, still could not help wondering if Henry's changed attitude was not due entirely to his being just plain scared. Well she knew that at heart he was easily frightened, and that nothing could frighten him more than the prospect of losing his property, which meant so much to him.

Turning her thoughts to her own status in the community, she remembered Enoch and Nancy's comforting words—that emotions are always more powerful than reason in wartime, and that hatreds flare even more fiercely back of the lines than on the battle-front. It looked, now as if the war might end before long, and if Henry continued to change his attitude, it could be, as Nancy and Enoch had said, that the bitter feelings of the neighbors would in time die out, and she could live a more peaceful life, if not a happy one, with Henry.

(To be continued)

## Retire?

### I'm Going to Have Some Fun!

In 8 more years I'll be 65. Then I'm going to do a lot of things I've wanted to do all my life—visit my brother, for example.

I might even retire. In fact, I can retire—on the comfortable income I'll be getting from my Farmers and Traders retirement policy.

You can do it too—if you start now. And you protect your family at the same time—all with one low-cost policy.

## AT HAYFIELDS

By TOM MILLIMAN

### Pea Harvesting—An Opportunity For Young Men

**I**N THE States of New York, Pennsylvania, and New Jersey, 45,000 to 50,000 acres of peas are generally grown for freezing and canning. Most of the acreage is harvested by methods identical with the Hayfields' picture (to right) below. At the time of pea harvest, the farm men who do the work are sorely needed in the hayfield, also for cultivating corn, and for cultivating and spraying potatoes, beans, etc. The peas won't wait. The cumbersome method as used at Hayfields is so inefficient that it frequently results in quality of peas coming down as delay in harvest occurs. This is followed by lowered returns to farmers and processors.

Hayfields grows peas under these conditions only in those years when:

1. One of our best fields for alfalfa is to be newly seeded;
2. We can use to advantage the light grazing of alfalfa which generally occurs in late August and early September following peas;
3. The peavine silage is needed for cattle in the winter.

Invariably when we grow peas, haying, cultivating and pasture clipping are upset and delayed. We have pea ground and would grow peas every year if only such an outfit as is shown in the Seabrook Farms picture was available.

Several ways present themselves for breaking the old pea harvesting bottleneck. Among them are:

1. **Ownership by pea growers.** Only the largest pea growers, such as the giant Seabrook Farms, can justify the ownership of a harvester-elevator which costs nearly \$5,000 exclusive of tractor. Many pea growers have fewer than the 12 acres grown at Hayfields this year, while a few others may go as high as 20 or 25 acres.

2. **Pea processor ownership and operation.** To insure successful operation, the processor would have to own tractors big enough to deliver sufficient energy through power take-off for simultaneous locomotion, cutting, raking back, conveying and elevating. The pea season averages 4 weeks in length and seldom more than 5 weeks.

When peas are in season, the processor has all he can do to find enough skilled and unskilled help to take care of the vining (shelling), screening, washing, blanching, sorting, and canning or freezing the peas. Few processors can find the manpower for pea harvesting, to say nothing of tying up money in harvesting equipment, including the tractor, which would be idle about 48 weeks of the year.

3. **Custom service ownership and operation.** Pea harvesting is the kind of job for the man who owns a good sized tractor for other purposes, keeps it busy much of the year and only has to buy the pea harvester. Such a man may be one who does grain combining which starts right after pea harvest. He may do corn picking, he may do custom plowing, or tearing up old sods with a giant disk harrow, or he may make various other uses for his tractor and special machines. He is the kind of man who is willing to work for himself by day, sometimes by night, and Sundays

too. Such a man, in some cases, would need aid in financing the pea harvester, and would have to see profit in sight before committing himself.

This is the method I have had in mind as being soundest and most equitable to pea grower and processor alike. There are not less than two makes of pea harvester to choose from. The one made in Waterloo, N. Y., by a small manufacturer who started from scratch is the only one I have seen in operation. It has been proved to be satisfactory.

#### Small Processor First

It was most gratifying to learn that Alton Canning Co. of Alton, Wayne Co., N. Y., with a single moderate sized plant, took the lead in arranging the purchase of 4 pea harvesters by custom operators. Two of these machines were paid for in cash by the operators and the other two required some financing by Alton Canning.

The contract growers of peas for Al-

ton Canning Co. were in 1951 blessed with the opportunity of having their peas harvested on a custom basis. They paid a flat rate per acre for getting the whole job done. Hired trucks did the hauling.

Two other processing companies are experimenting. In each case the equipment is owned and operated by the company, and expansion doesn't seem to take place very rapidly. On that basis some problems present themselves which the Alton Canning Company and their contract growers have avoided. Much credit is due President Burns and Vice President Morton Adams, an ex-county agricultural agent, in searching out and putting into practice the soundest way for farmer and processor to get peas from field to plant faster and fresher.

#### Letters Invited

Should this article make sense to the pea growers of the Northeast, I would be glad to hear from them. If those pea growers and prospective pea growers who would pay from \$10 to \$17 an acre for having their peas cut, elevated and loaded, will write me to that effect care of AMERICAN AGRICULTURIST, we will have something to go on. No names will be published or sent to processors unless the writers ask that it be done.

A summary of the replies will be made, published here, and sent in reprint form to pea processors throughout the Northeast. As an indication, Hayfields will welcome the opportunity to hire the service described and, while preferring to pay \$10, will go as high as \$17, the top for 1951, to get the job done. Then haying, cultivating, and other farm work can go on instead of

ABOVE: PEA HARVESTING AT SEABROOK FARMS

The apparatus appearing at right of picture is a mower above which are mounted revolving rake bars long enough to reach forward, clutch the uncut pea vines and pull them backward as the cutter bar of the mower detaches them from the roots. The same rake bars pull back the cut pea vines to a horizontal conveyor which doesn't show in the picture. This conveyor moves the vines at right angles to the direction of the tractor and dumps into the elevator. This is a speedy operation with tractor moving at 6 miles an hour. Note the rod with a flag on it to guide the truck driver, who thus spaces his truck for self-loading.

BELOW: PEA HARVESTING AT HAYFIELDS

One man is missing from this 5-man scene because we don't have the sixth man. The missing man carries a pitchfork, walks behind the mower, and pulls the peavines free from the cutter bar, when he can. When we must have him, the walker is borrowed from the load. Compared to Seabrook, Hayfields takes upwards of 4 times the man hours per acre for harvesting and loading peas. The truck moves at 2 miles an hour or less; when speeded up it has to stop while the men on the load tug at the exhausting job of moving peavines forward. Except that horses are gone, it is exactly the same as when I helped harvest peas 45 years ago on my father's farm. No more peas for Hayfields until custom harvesting has arrived.

being halted completely while pea harvesting is done by the methods of 40 years ago.

#### BONDS AND DOLLARS

**C**OME September, it will be 10 years since I began buying U. S. Treasury E Bonds at \$75 for the \$100 bonds. A month from now the oldest of these bonds will be cashable at \$100. Each has earned \$25 interest for the ten years or a gain of one-third on the investment. Pretty good, and the prospect of cashing a bond or two each month for the next five years is exciting as I work it out on paper. Great satisfaction is to be had from pencil work showing how profitable it was to be prudent, patriotic, and persevering in the purchase of Government Bonds.

But pencil work tires me. That is too bad, because as long as I stay with the pencil I have a great time for myself. Instead I turn to the milkhouse we must build in a handier location. If we get rid of the 15-year-old square milk cooler, and buy another narrow side-opening cooler to go with the one purchased this summer, we can build a smaller milkhouse. We need another tractor cultivator; in fact, we need to change one of the tractors for a larger size. We need to paint three houses and four barns, next year at the latest. One barn needs a new roof. But I have the bonds and plan to start putting them into action this fall and winter, as far as they will go. How far will they go as compared to 1941?

#### 1941 Cost 1951 Cost

Carpenters .....	\$100	\$234
Painters .....	100	241
Lumber .....	100	295
Farm Machinery..	100	170
Electrical Equip- ment .....	100	328
Farm Labor (Married) .....	100	225
Mechanics (Repairs) .....	100	222
Horses .....	100	30

When I take the \$100 bond and go to market, the only thing I can gain on is horses. But I sold the last team of horses this spring after finding no one to drive them and only two pieces of horse-drawn equipment left on the farm. The 1941 dollar has been shot to pieces.

*War caused some of this change in the dollar. War is waste. But wars must be won and their cost is not debatable. Observe what has happened since World War II and figure out for yourself the effect of the enormous non-military government spending of the past six years.*

All I try to do here is to show what happened to the purchasing power of my E Bonds. More or less the same thing has occurred to all ten-year-old fixed income investments.

#### Chaff

"The best fertilizer is the heel of the owner." Eugene Meyer, chairman of the Board of the *Washington Post*, wrote this out and handed it to me as a saying he learned on visits to France. "The eye of the owner fattens the ox," is the way the English put it.

Little boys at the toolshed, with their chests pressed against wheels and their noses inches away from the repairs men are doing, absorb more about farm machinery tinkering than most city-reared adults will ever learn. What little the boys may miss by eye and ear seems to soak in through their skins.

And if grownups have difficulty in memorizing the identity of cows in a big herd, get the boy of 9 or 10 on the job, unless there's a girl of same age. She will do even better.

In buying a farm, look for one with many woodchuck holes. Woodchucks multiply as soil is built up and legumes cover more of the land. As to reducing woodchucks, having tried only six methods, I can offer no advice as yet. Inviting city friends to come out and shoot isn't a bad idea.

**Happy Is The Day When Backache Goes Away . . . .**

Nagging backache, loss of pep and energy, headaches and dizziness may be due to slow-down of kidney function. Doctors say good kidney function is very important to good health. When some everyday condition, such as stress and strain, causes this important function to slow down, many folks suffer nagging backache—feel miserable. Minor bladder irritations due to cold or wrong diet may cause getting up nights or frequent passages. Don't neglect your kidneys if these conditions bother you. Try Doan's Pills—a mild diuretic. Used successfully by millions for over 50 years. It's amazing how many times Doan's give happy relief from these discomforts—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

**Service Bureau**

By HUGH COSLINE

**SKIP-TRACING**

I received a card advising that a package was being held for me. I am supposed to return the card and the package will be sent at no cost to me. What I can't understand is why they need a description of me in order to determine whether the package is actually meant for me.

Apparently, this is a form of skip-tracing. A collection outfit will get a list of bad debts to collect. They send cards to all persons with a certain name in an attempt to determine which person is the one who owes the money. This practice is frowned on by the Post Office Department. In fact, several operators of such companies have been tried for fraud by the Department.

We suggest you ignore any such card that may come to you.

— A.A. —

**SEND FOR YOUR COPY**

"Before you invest, investigate." "Read before you sign." These warnings are contained in a Better Business Bureau booklet called "Facts You Should Know About Schemes." We have a few of these booklets which we will send to subscribers on request as long as the supply lasts. Address your order to AMERICAN AGRICULTURIST, Box 367-F, Ithaca, N. Y., and inclose six cents to cover postage and mailing costs.

— A.A. —

**HANEY STUDIO**

An agent from Haney Studio made me a special offer for pictures of my children. I paid him \$13.95, the full amount, but have never received the pictures. Two of my neighbors are also out \$13.95 on this same deal.

During the past year or two, we have had a number of complaints against Haney Studio and have never been able to get answers to letters written them. In this particular case, we wrote them four times. None of the letters were returned, but we have never heard a word from them.

It is risky business to pay for merchandise before getting it, unless you know that the company you are dealing with is absolutely reliable. Even then, it is important only to pay the amount called for on the sales contract. The down payment is usually the agent's commission; and if he doesn't get anything additional, there is no temptation to neglect sending in the order.

— A.A. —

**INTEREST RATES**

"In the Service Bureau column, issue of June 16, under the heading "Personal Loans," you state that: "The interest rate will be a little better than 10%. Figure it out for yourself."

"I did figure it and find you are conservative. Using the example you cited (that is a \$100 loan payable \$10.07 a month for 12 months), the borrower has the use of an average of \$54.17 for 12 months. For this he paid \$20.84 interest, making a simple interest rate of 38.4%.

"As a loan officer of a bank, I find that few people know what rate of interest they are paying and that their main consideration seems to be the amount of the monthly payment required. People need a lot of education about interest rates. Perhaps a few articles in your paper along this line would help."

—Ralph Higley, Walton, N. Y.

— A.A. —

An old Agriculturist subscriber offers a number of books by C. A. Stephens at a moderate price. Any interested reader may address W. C. Witte, 112 Lee Ave., Trenton 8, N. J.

**A.O. Smith HARVESTORE**

**Cuts Feed Costs 31%**

for Eralen Strey, Augusta, Wis.

From DHIA sheets going back five years in a running record of his operations, Eralen Strey of Augusta, Wisconsin, determined that before he had his HARVESTORE, feed costs per hundred pounds of milk ran to \$2.14.

After his HARVESTORE was in use, cost for feed went down to \$1.47 per 100 pounds of milk produced.

That's a saving of 67c per hundred pounds of milk—and Strey's herd produces around 20,000 pounds a month.

That's a saving of 31% in feed costs, gained by cutting out concentrates that are not needed when feeding pickled pasture from the HARVESTORE.

"With a record of this kind," Strey writes, "you may be assured that the installation of the second HARVESTORE is in my future plans."

**Additional Reasons Why You Should Own a HARVESTORE**

**STOPS SPOILAGE!** Sealed construction keeps out air that causes spoilage, heating, nutrition losses. Saves "spring pasture" values for year 'round feeding.

**SAVES WORK!** Mechanical bottom unloader saves hundreds of man hours every year. Ends daily climb to pitch out silage.

**NO MAINTENANCE.** Smooth glass-surfaced steel, inside and out—no rust or corrosion—needs no painting or upkeep.

**NO FREEZING PROBLEM!** Delivers feed at any temperature.

**MORE PROFITS!** HARVESTORE gives you a better system of farming. Makes summer feeding practical. Promotes better herd health—more milk—more beef—more dollars.

You'll like it the minute you drive it!

# the McCormick® Farmall® Super C

## You'll like the Easier-Than-Ever Steering

You'll get a new tractor driving thrill when you're behind the big 18-inch steering wheel of the new Farmall Super C. You enjoy easier-than-ever steering. You'll like the comfortable cushioned seat; the smooth, accurate response of Farmall Touch-Control for lifting, lowering, adjusting equipment.

## You'll like the Balanced Pull-Power Traction

Feel the *extra* pull-power traction you get from the proper balance between 12% more engine power and the right tractor weight when the big 54-inch-high rear tires on the Farmall Super C grip the ground to lug the load. There's less wheel slippage—and that means *more* work—*faster*, with less fuel.

## You'll like the Instant-Responding Disc Brakes

You'll make smooth, pin-point turns at the end of the field when you apply just the slightest tip-toe pedal pressure to these conveniently positioned double-disc brakes. On drawbar work turn-arounds, the swinging drawbar brings pull-behind machines around in a hurry, with no binding or tugging.

## You'll like the Full Line of McCormick Implements

Judge the *better* work you can do with any of the 25 McCormick implements size-matched to the Farmall Super C. Many are direct-mounted, quick-connected. Drive the Super C for a round or two in the field—or all day—with a 2-furrow plow or a disk harrow. Use it for haying; for hauling and belt jobs.

ASK YOUR IH DEALER for a Farmall Super C DEMONSTRATION . . . SOON! There is no obligation. You'll like it the minute you drive it!

## GOOD LIVING ON *Green Acres*

By H. L. COSLINE

**B**ETTER grass is what has me farming today," John Quinn told me when, along with Broome County Agent O. C. Barber, I stopped in to see what he thought of New York's Green Acres program, sponsored by the county agents. John was on the verge of giving up the farm about eight years ago when he decided there might be something to all this talk about improving pastures and hayland.

"I started in plowing, liming, spreading phosphated manure and seeding my pasture land in 1943. Today, with my son and partner, John, Jr., we are milking 29 Holsteins that averaged 13,000 pounds of milk last year. That's more than double the average we had eight years ago."

The Quinns, like Crawford Dohnken, another Broome County dairyman we called on, and like dairymen George Comings and Russell Smith of Chenango County, whom I called on later in the day with County Agent H. W. Matott, all

Grassland farming pays off at the milk cans on the Chenango County farm of George Comings and son, Phillip. Here George, left, is shown discussing production with County Agent Howard Matott.

▲ Crawford Dohnken, Broome County dairyman, shown above with his family and pets, figures that it is his job to do the farm work and his wife's job to run the home. Crawford, who is doing a fine job of farming at a 1600-ft. elevation, says, "Whenever I buy a piece of machinery for the farm, I also figure on buying a piece of equipment for our home. We have electric power, a quick freezer, central heating and modern plumbing." The Dohnkens are active Grange members and Crawford, because he is grassland farming, even finds time to go hunting in the fall.

◀ John (Dick) Quinn, right, seriously considered giving up farming a few years ago, to seek another means of earning a living. Then he became interested in better grass, stuck with the Broome County farm and now his son John, shown with him looking over some excellent hill pasture, is following Dad's footsteps as a junior partner.

give credit for a better living on the farm to the development of grasslands.

Their farms are all different, ranging from some river flat on the Quinn farm to the 1,600-foot elevation of Crawford Dohnken's place at Fort Crane, but they are all equally enthusiastic about producing better roughage. Each developed his land his own way, but three things were common in all four operations:

1. Each added plenty of lime and fertilizer.
2. Each was careful to choose the legumes and grasses best suited to his farm.
3. Each practiced very careful management of both grazing and harvesting.

For instance at Quinn's I saw a beautiful 45-acre hill pasture divided into five fields by electric fences and with five diversion ditches to prevent run-off. The cattle are rotated from one field to another so that they always have the best pasture available and in order to give the pastures a chance to recuperate.

### My Cows Were Hungry

"Good grass has made all the difference in the world on our place," Dohnken told us. "When we bought this hill-top farm four years ago, my cows just didn't have enough to eat. To give my family the good living we wanted, I had to turn my attention to better pastures and better hay production." The results have been good. Today he has 15 acres of top-notch pasture, and 15 acres more that will be in that class in another two years.

Good management practices plus his mechanization of the farm have not only brought him the kind of living he wants for his family but also he has (Continued on Page 14)

## The First Egg is the signal for G.L.F. Laying Mash

*A practical feed for farmers who make their living from poultry*

**W**HEN the "pee-wee" eggs begin to appear and the pullets are moved into their laying quarters, they are finally beginning to pay part of the costs. At this stage a radical change takes place in the life of a pullet—she no longer eats just to grow and develop—from here on she eats for egg production too.

### *Getting The Most From Every Hen*

Every pullet going into the laying house has an inbred ability for egg production. The care and raw materials she receives de-

termine the outcome. That's why the laying mash she receives must be formulated for economical egg production as well as growth and health all through the laying year.

G.L.F. Laying Mash has been doing just this on more than 100,000 farms year after year. The combination of a farmer-owned feed business—nutrition facts from poultry scientists—modern mixing plants and community service—can't be beat as a way of doing the job.

Cooperative G.L.F. Exchange, Inc., Ithaca, New York.

### CHECK LIST FOR THE LAYING HOUSE

*Some things to remember in getting ready for the laying season:*

**FLOOR SPACE**—3 to 3½ square feet per bird for Leghorns. 3½ to 4½ square feet per bird for heavies.

**ROOSTS**—7 " per bird for Leghorns. 8 " per bird for heavies.

**WATER**—100 hens will drink about 5 gallons per day.

**FEEDERS**—20 feet of feeding space per 100 birds.

Look over the poultry equipment at your G.L.F. service agency. It is modern, economical, designed to follow poultrymen's suggestions.

*Ask your service agency for a G.L.F. Egg Record Chart*

# A Record Crop of OATS and CORN

By  
W. B. LEWIS

**T**HE farm papers nowadays report so many records broken each year on produce and livestock that some are hard to believe, but we still remember a record made in 1886 that we doubt will ever be surpassed. By "we" I mean my twin brother and myself when we were thirteen years old and living on a farm next to Ben Gilper in Steron.

Ben owned 100 acres. The farm was left to him by his grandfather, so he married Sara Palmer, who was his own age, 23, and settled down.

One day in June Ben found a big curly maple at the edge of a small clearing in his woods. The only enterprise in the village two miles away was a furniture factory, and the next day Ben called on the owner, Mr. Buzzard, and said to him:

"I have a real curly maple that will cut 3,000 feet of lumber, and you have a veneering machine. I'll sell you the tree for \$500."

Mr. Buzzard laughed. "I can use the tree, Ben, but you are just \$475 too high! I'll look at it, and you can deliver it here for \$25.00." Said Ben: "I'm a little hard of hearing, Mr. Buzzard," and he went away.

Finally, Mr. Buzzard did give Ben \$250. The next week he came and brought three men in a wagon with saws, axes, shovels and wedges which were unloaded at the foot of the tree. The driver turned the team around in the clearing so they were facing the tree and toward home.

As the men got to work, Ben said: "Mr. Buzzard, if the tree falls true, don't you think those horses should be moved further away and tied?" Mr. Buzzard surveyed the distance with his eye and said: "Let them alone, there's 200 feet to spare."

As trees often do, there was a noise like a pistol shot as the tree started to fall, but it hung for a second or two before it started down. The pistol-like shot frightened the team and, as they were headed for home, they thought it a good time to go. By good teamwork they made it under the top as the tree crashed down, breaking the necks of both horses and smashing the wagon.

The men waited for Mr. Buzzard to explode, but he said: "All my fault, boys—I'm glad it was the old team. Get to work on the top and save the harness." The tree was perfect, and that appealed him for loss of the team.

It took quite a ground space to dig a hole for two horses side by side, but the rich loose leaf mold was easy digging, and soon the job was done.

The following March, Ben wanted some fence posts, and he had a new hired man. Said Ben to Sara: "Make us a pile of coffee and some sandwiches. We can cut the posts in one day if we don't have to come home to dinner."

At noon they dumped some oats into

nose bags for the horses, and in the oats was perhaps a quart of shelled corn; and, as horses do, they tossed their heads to get the feed and spilled grain on the wagon box floor.

While men and beasts were eating, the hired man pointed and asked why a square of ground was sunken down. Ben told him about the team buried there and said, "let's see how good fertilizer these buried horses make." He gathered up a big handful of the spilled oats and corn and sprinkled them on the grave, and shoveled four inches of dirt on the grain, then tramped it down; and with the Spring work coming right on they forgot about it.

The last week in June the men

were caught up with their work, and Sara said: "Don't forget you promised me some good dirt from the woods for my flowers."

Said Ben to the hired man: "There are thirty posts back there we couldn't load, we will get them and the dirt." So they drove back to the clearing and fairly clutched each other at what they saw before them.

Finally they got down from the wagon seat slowly, but never took their eyes from the oats and corn for fear they would vanish. Not a word did they speak. Most oats one looks down on, but these they looked up at.

They carefully pulled an oat stalk down toward them. The spike was 22 inches long, and the kernels as thick through as a marrowfat bean, and the spike would shell two quarts of oats. The oats being grown up all around the corn, they could not feel a corn stalk without trampling the oats. After a while Ben said: "We'll get Sara's dirt, but never mind the posts." They drove to the back of the house to unload the dirt, and when Sara came out they told her about the oats and corn.

Sara laughed and said, "All right, I'll go back and see the joke."

Driving into the clearing they pointed, and her eyes popped and her mouth fell open.

At last she asked: "What are you going to do with this, Ben?"

"The State Fair seed men will pay a terrific price," said Ben, "and we'll charge admission in a tent on the Midway. Sara, don't you see we're rich?"

The next morning they cut the oats, one stalk at a time, and gently laid them in the wagon box—stalks two inches through at the base, and there were 82 of them! Then they put a

twelve-foot ladder up against a corn stalk, and took turns going up to inspect the three lower ears. They didn't husk an ear back, only one a couple of inches, and they "felt out" the ears. Some of the stalks would be over twenty feet tall by harvest. One stalk had seven ears, one had eight, one had ten, and the other eight stalks had nine ears each—ninety-seven ears on eleven stalks!

The stalk with seven ears was 18' and the tallest one 22' 9" high. The shortest ear was 1'11", and the longest 2'11".

The Fair was dated for September 15-22, so Ben wrote the Association that he had an unusual exhibit and wanted the steward on space allotment to come and see it, offering to pay all expenses and his time.

Steward Jones arrived the next morning, just as the hired man was taking the horse blankets off the corn. Jones was speechless but finally touched a stalk. They had husked down the ear that had broken off, and from it Jones pried one kernel and cut it in four pieces. He put one piece in his mouth and chewed.

Said Jones: "I want to see where you grew this."

They drove back to the woods, and Jones just gazed. Then he said: "Cut a piece of that oat stubble, about two foot square, and put it in a box and take it to the Fair."

At the dinner table, Jones said, "You will have to have a baggage car switched in at your station here, and we will switch it inside the grounds where we unload livestock. I will get you a regular show tent 30 ft. long with 25 ft. tables through the center to lay the corn on. You will have to have a guard at each end of the tables in eight hour shifts, night and day, to watch the people, there must be at least two ticket sellers at the entrance."

Then they fell to work on the wording of a big sign, which read:

**THE GREATEST SHOW ON ANY FAIR GROUNDS!**  
**WORTH GOING 'ROUND THE WORLD TO SEE**  
**CORN 23 FEET HIGH—**  
**NINE EARS TO THE STALK**  
**ALL EARS FULLY MATURED**  
**97 EARS ON 11 STALKS—**  
**THINK OF IT!**  
**OATS 8 FEET HIGH!**  
**SPIKES 2 FEET LONG!**  
**EACH SPIKE WILL SHELL**  
**2 QUARTS OF OATS!**  
**UNBELIEVABLE?**  
**SEE IT WITH YOUR OWN EYES!**  
**ADMISSION 50 CENTS—**  
**WORTH \$10.00.**

The first day at the Fair the ticket sellers took in \$4,002. The second day attendance was 38,118. Ben and Sara passed 18,200 through their tent, or \$9,100. Those were the two poorest days.

Seedmen and their employees were in a half dozen times each, asking sharp questions on raising conditions. Ben had brought in a big box of earth and the stubble and the corn stumps. The seedmen were skeptical, but one of them had an idea. On the auction day he ran the bidding up to \$9,200; then removed the exhibit to another fair the next week and got his money back in admissions.

The admissions to Ben's exhibit amounted to \$45,052; sale price to \$9,200, and Ben made \$54,252. He gave each guard and ticket seller a \$50 bonus, and Mr. Jones \$500. He had over \$50,000 left, and gave Charlie, the hired man, a deed to the farm.

Now, we would like to substantiate that record, but we were only thirteen, and the rest of the folks were much older. We doubt if any of them are still living, but we always kept those measurements, and we helped count the money! Isn't that proof enough?

## A HOMEMADE BARN

Henry Van Ort, R. D. 3, Schenectady, N. Y. (left) built a substantial addition to his dairy barn in 1948. He did it with the help of a hired man and with some assistance from his two sons, Richard (center), now 17 and a junior in high school and John, 15 (right), who is a sophomore. The addition is the end nearest to you in the above picture. The siding is still to be applied.

The lumber was sawed from logs cut on the farm. The addition is 60 x 37 feet, the unusual width resulting because that was the width of the old building. The stable holds 30 milkers.

"The Schenectady County Farm Bureau," says Mr. Van Ort, "was of real help to me in working out the plans for the barn."

Without figuring in the amount for labor, but including the bill for sawing

lumber, the cash cost of this barn was \$2,500. The cost mentioned does not include the cost of the silo shown in the picture.

# THE EDITORIAL PAGE

## CUSTOM WORKERS MUST FILE REPORTS

"I have read the AMERICAN AGRICULTURIST for as long as I could read. This is the first time I have asked for help. I would like to know more about the statement in the newspapers that farmers doing custom work must file with the OPS (Office of Price Stabilization.) I'll quit doing custom work before I'll file." C. V., N. Y.

UNFORTUNATELY it is true that farmers who offer certain services have now been brought under a ceiling price regulation and must file statements with the OPS. Services include the baling of hay and straw, combining, threshing, silo-filling, plowing and fitting land for a fixed fee, and other related work. Farmers who do this work must state what they charged for those services during the base period from December 19, 1950 to January 25, 1951. They can charge only slightly more than they charged last year.

In hundreds of neighborhoods it is difficult to get custom work done. Time and again I have had to take much time and drive for miles in order to get someone to do my field baling. Here is an outstanding example of complete regimentation and government by bureaucracy. It is too late to do anything about it after laws like the price control laws are passed, and after the bureaucrats begin to issue regulations.

That is why over and over again we have urged farmers to pay more attention to these issues and bills when they are before Congress, and to write and telegraph their views to their congressmen. I know that to take such action is often difficult because you are so busy, but if you don't do it, you'll end up just as we have in this particular case, and it will take far more work to comply with the regulations than the few moments it would have taken to express your emphatic opinion to your representatives. And, what is more serious still, every step toward more bureaucracy is a step downhill in the loss of freedom.

## A CHALLENGE TO WOMEN

WHEN WOMAN suffrage was proposed, I was enthusiastic about it and did what I could to bring it about. It seemed to me that women were on a higher moral plane than men, and that their great interest in their families and children would, if they could vote, help to bring about peace and a much better situation in politics and government.

But the results of woman suffrage have been disappointing.

Since it started, America has been in two world wars, and we are at war now. Taxes are ruinous, our government is riddled with scandals, and we are rapidly losing the freedoms that cost our forefathers so much.

Our generation is not handing on the torch of freedom to the young people who will follow us.

So now I ask in all seriousness, what has happened to the so-called elevating influence of you women? You have added greatly to the cost of elections; what have you added in results? I hope you will tell me in hundreds of letters, but don't tell me that you are too busy to take an interest in better government and world peace. Men are busy, too.

You can take my opinion for what it is worth and tell me if I am wrong. I think your community or public housekeeping is not on a par with the good housekeeping you are doing in your homes. One is just as important as the other. I think you have been just as indifferent and careless as the men in exercising your suffrage privilege and in learning about your local, state and national government machinery and the great problems of the day, the right solution of which will mean so very much to your children.

How many of you know how your town and county and school district governments are set up?

## By E. R. Eastman

How many of you have tried to have some part in the nomination and election of your local, state and national officials? How many of you know who those officials are? How many of you have ever contacted the members of your State Legislature or members of Congress to tell them what you think about important issues?

There never was a time in history when it was so important to understand public issues and, particularly, to act right on them. And you are the girls who can do it. You have your Parent-Teacher associations, your Home Bureaus, your Granges. Most of all, you have yourselves. I think there is much more that can be done working through groups and organizations already established; if not, organize your own group. The women of this country can do much if they are willing to stand up and be counted.

## WE NEED A REVIVAL

AMERICANS often wonder at the tremendous material or "gadget" progress that has been made in the last fifty years. Our lives have been transformed by the automobile, power farming, the phonograph, the telephone, the radio, and that most marvelous gadget of all, television, as well as a thousand and one other inventions that our grandfathers never dreamed of.

But unless we find some way very soon to bring our spiritual progress in line with our material progress, we stand a good chance of committing world suicide by means of our own marvelous gadgets.

Only two or three days ago, ninety boys were fired from West Point Military Academy for cheating. West Point cadets are carefully selected and are supposed to be the pick of the land. Elsewhere, dozens of other young men have been arrested for "throwing" basketball games. There is a general epidemic of juvenile delinquency across the land, crime is on the rampage, and our government itself is riddled with scandals.

Above everything else, we Americans—and all the other nations in the world, for that matter—are in sad need of a revival of old-fashioned morals.

## PROGRESS

NO ONE could attend the annual meeting of the New York Artificial Breeders Association, listen to the speeches and reports, and see the fine show of artificially bred cattle without being impressed. The meeting, held on August 4, was attended by more than 2,500 delegates and members from 68 local affiliated artificial breeding associations in New York State and western Vermont. In eleven years this organization has grown from nothing to 36,000 members, with over 212,000 cows artificially bred last year.

To realize how fast artificial insemination is improving the quality of our dairy cows, one has only to remember that practically every one of these cows was served by a bull far better than most dairymen could hope to own.

## APPLE GROWERS NOT TO BLAME

RECENTLY thousands of bushels of apples in the Pacific Northwest were dumped because marketing conditions were such that they could not be shipped across country at a profit.

To give you an idea of what all growers are up against, and particularly those who live a long distance from a market, take a look at the transportation and distribution charges on a box of apples. According to the U. S. Department of Agriculture, when a Western grower received an average of \$1.17 over a six months' period for a 42-pound box of

apples, this brought in Pittsburgh \$5.12. The freight charge, including the Federal transportation tax, was \$1.08. Added were brokers', wholesalers' fees and the retailer's mark-up of \$1.20. So the apples had to retail at more than 400 per cent of the price paid to the grower. Producers are not to blame for high retail prices.

Eastern growers can take considerable satisfaction in the fact that they live near the big markets, but sometimes this very fact beats down the price to eastern growers, because it enables the producers and the truckers to put too many poor apples on the market.

## BEST POULTRY SECTION

THE NORTHEAST is one of the most important and most prosperous poultry sections in the world. In 1950 the northeastern poultryman received 11 cents more per dozen eggs than the U. S. average, and he gets an average of 19 more eggs yearly from each hen.

The principal reasons for this are that our climate is particularly well adapted for poultry, we are near the great markets, and our poultrymen are scientific, hard working and experienced. However, all are agreed that competition from other sections is rapidly increasing, with the result that there is more need than ever to keep the birds healthy and production costs low.

## PROGRESS BY BREEDING AND SELECTION

DID YOU ever stop to think how the processes of selection and breeding have improved our animals and all of our crops? I once knew a farmer whose family for several generations had selected the best ears of sweet corn for over 100 years. The result was a variety of corn of which that farmer was justly proud.

When the scientists added the process of breeding to selection, the result was the hybrid varieties of corn that have added tremendously to America's great corn crop.

The wild cow gave only a few hundred pounds of milk in the spring of the year, just enough to get her calf growing until it was weaned. Now, by the process of selection and breeding, we have our fine dairy herds. Today hundreds of cows average 10,000 to 12,000 pounds of milk a year, and there has been at least one individual that has produced over 40,000 pounds in a year.

All of this progress in agriculture has been made by selecting the best breeds and varieties and by breeding. When you stop to think that from either the standpoint of selection or breeding the human race is still where plants and animals were ten thousand years ago, it is remarkable that we do as well as we do.

## EASTMAN'S CHESTNUT

I HAVE a faint recollection of printing this story in this corner many years ago. Anyway, when I read it recently I got another laugh out of it, so maybe you will.

A woman bought a parrot from a pet store. When she got it home she was much troubled by the parrot's cursing all of the time. Finally she said:

"If I ever hear you use such language again, I'll wring your neck!"

A while later she remarked to herself that it was a fine day. Whereupon the parrot said:

"It's a helluva fine day today."

The lady immediately took him by the head and spun him around in the air until he was almost dead.

"Now then," she said, severely, "It's a fine day today, isn't it?"

"Fine day!" sputtered the parrot. "Where the hell were you when the cyclone struck?"

# AA's Farmers' Dollar Guide

**FARM QUIZ:** It's a good time to go over farm operations. Here are some questions to ask yourself:

1. Will I have enough roughage to last till pasture? If not, should I sell animals or buy hay?
2. What can I do this fall to insure more and better hay and pasture next year?
3. Am I feeding too much or too little grain for best results?
4. What repairs are needed before winter? Are buildings properly ventilated? Are windows and roofs tight?
5. Should I sell or hold cash crops and fruit?
6. Is labor being used efficiently? Could I get along with less or could I expand operations without hiring more?
7. Is my hired man satisfied? Is the tenant house adequate?
8. Has the herd's milk production increased steadily in recent years? Should I join the DHIA? Should I use artificial insemination?

These are just a few of the countless questions every farmer must answer. Why not ask the whole family to suggest others for your farm and to discuss possible answers?

**CAKE:** Too many housewives want cheaper food and controls without the scarcities, black markets and higher taxes that would inevitably accompany them.

Too many farmers want price supports, PMA payments and other government helps without the controls that always follow.

It's time to choose between free enterprise and socialism. To those who say, "We'll never get rid of controls," we reply, "Probably not, but at least let's reverse the trend from more government paternalism to less and less."

We could do it if more of us were like the farmer reported in this story from the *Washington Daily News* under the title, "It's Your Money They're Spending": Hilarion Bibicoff, a farmer near Dexter, Michigan, has returned a \$7.50 check sent him by the government as payment for attending a production marketing association meeting. He says he didn't learn anything there he didn't already know. Furthermore, Mr. Bibicoff intends to send back another check for \$3.50. That one was for attending a soil conservation meeting, and he says he didn't learn anything new there either.

**PUSH:** Continual drive toward more government by government employees gets irksome and disturbing. For example, Council of Economics Advisers recently sent President Truman a study by New England economists urging New England to forget its traditional independence and participate in more Federal, social and economic programs. **Study pointed out that Federal Government was taking more money out of New England than it was putting in!**

Why not be more independent and work to send less and less money to Washington for "social and economic programs?"

**WEATHER:** Rain makers face government restrictions. Whether or not they are responsible for recent ruinous floods, lawmakers are discussing licensing of artificial rain makers in order to keep track of their activities and accomplishments for a few years—long enough for Congress to know whether "making" rain is feasible.

**CONTROLS:** With most of price control powers trimmed, why not discontinue OPS entirely and save money for the taxpayers? Both parties have been playing politics, trying to jockey themselves into position to blame the opposition if prices go higher, or grab credit if they go lower. But for months ahead the prices on most farm commodities will be determined by an old, natural law—the law of supply and demand.

**SCRAP:** As always during war or preparation for war, scrap metal is short. Kill 3 birds with one stone. Clean up the farmstead, get some cash, and help the defense effort. —Hugh Cosline

## The Song of the Lazy Farmer

FOR YEARS I've thought the folks who take opinion polls were mostly fake, because they'd never questioned me and no one else that I could see. I've been right here most ev'ry day and always glad to have my say, but no poll man's been smart enough to give me chance to strut my stuff. This oversight, of course, explains why polls have had such growing pains; no one can find out what is so unless he asks the folks who know; however scientific he attempts to make his survey be, his poll's results will never do unless he talks to me and you.

Today, at last, a pollster came, but it turned out to be the same because, right off, he asked my view on what the U. N. ought to do; but after I had spent an hour upon my answer, he looked sour and put a little check mark there inside the "undecided"

square. That leaves me right where I began, I don't see how a feller can expect to find out much at all when he has so much nerve and gall that he won't try to analyze an answer that's both right and wise. If that's how he treats all smart men, his poll's sure to be wrong again.

Here is proof...

# soil treatment with D-D pays

**LAST YEAR . . .** this grower suspected that nematodes were the cause of his poor celery crop.

**THIS YEAR . . .** he ran a D-D\* test to find out. One part of the field was treated with D-D. The other part was untreated. Both sections were then planted and cultivated alike. Just before the picture was taken, U.S.D.A. nematologists found heavy infestations of nematodes in the untreated soil, but very few in the D-D soil.

**CONCLUSION . . .** nematodes were the cause of the scraggly crop and . . .

## D-D KILLS NEMATODES!

D-D, injected into the soil before planting, rids your land of nematodes and other soil pests for the season . . . allows plants to develop healthy, wide-ranging root systems and sturdy plant structure that means a profitable crop. D-D is easily applied and economical to use. Its cost is recovered many times over in increased yields and profits.

Call your Shell Chemical distributor for full information on D-D and its use.

# QUONSET

Stran-Steel and  
Quonset  
Reg. U. S. Pat. Off.

Quonset 32

The versatile Quonset is excellent for livestock housing or crop storage. Here a Quonset 32's capacity for all sorts of machinery is shown. Adequate shelter for expensive farm equipment pays for itself in short order!

Perhaps the hardest-working, least-complaining, and most versatile piece of "equipment" you can have on your farm is a Stran-Steel Quonset building!

More than just a building, the Quonset is a valuable *tool* on any farm—a production *machine* that works with you and for you.

The Quonset reduces hours of drudgery and miles of legwork. It's designed to increase volume and cut material and labor costs. Its uses are unlimited.

All over America, farmers of all kinds—in every section of the country—are ready to back up statements like this because their *experience* with Quonsets has proved the Quonset's real *value* as a farm building.

Wouldn't you—right now—like to have an all-steel, non-combustible, wind-resistant, vermin-proof building of all-year, all-round usefulness? A building that *works* for you? See your Quonset dealer!

Quonset 24

Quonset 40

Use this coupon for information about Quonsets as a farm production tool. We will include data on sizes, colors, and the name of your nearest Quonset dealer, from whom you can get the detailed costs.

By  
**E. STUART HUBBARD**

**A**PPLES are on the march—forward!

Apple growers, nationwide, at St. Louis, and at the New York and New England apple meeting at Simsbury, Conn., showed signs of waking up.

Reuben Benz of Washington State told dramatically how the West contributed to the failure of last season's apple market. Briefly, they had altogether too many small apples. Not only were they small, but many were of questionable quality and still they stored them. They paid for boxes, for storage, for packing, freight and selling. But nobody wanted small apples.

They spent \$100,000 in advertising to induce the public to use their small apples. The trade tried to move them—gave them first place in their stores. The public did not want them—would not buy them. They sold processors all they could use and saved the boxes. They finally had to dump millions of boxes of small apples because there were plenty of the large apples the public preferred.

### What the Public Wants

Eastern apple growers learned from sad experience, through low net returns, that the public does not want small apples or poor colored or defective apples when they can get large, beautiful perfect apples. They also learned that consumers will greatly and quickly increase their purchase and use of apples if they are told what apples are best for them to buy, how to use them and where to find them—and if the apples offered are beautiful to see, delicious to eat, and of size and condition for preparation without waste.

And so, there is at long last an awakening in a great many apple growers to the terrible need of doing something to bring brisk sales and paying prices in the apple markets. It may be that apple men will at last consider the realities of apple marketing and, putting aside personal habits, notions, false ideals and, mostly, inertia, work with their fellows to really sell apples this year.

Reports from all New England and

Eastern New York tell of state and county meetings where apple growers, many of whom have kept aloof in the past, joined in plans for strong apple advertising to start at harvest and continue through December. A budget of \$35,000 was adopted by the Institute for this purpose. The regular foundation budget was also adopted.

In John Chandler and Monty Marvin, these growers have an ideal team. The publicity work done by Monty has been so outstanding that apple groups, nationwide, have joined for apple publicity on a national scale. This can be most effective and still give recognition to local varieties and problems.

John Chandler is ideally fitted to work with trade organizations so as to have distributors and retailers take full advantage of the promotion by good merchandising of the advertised apples. He is also ready to assist in local marketing and promotion problems.

All these things can be helpful.

### Your Responsibility

It remains for each apple grower and packer to make this apple deal a success. It is the growers' and the packers' responsibility to see that the small, the green, the defective, unwanted apples never leave the trees or the ground and never get into cold storage, unless there is a certain, profitable outlet for them. There is no need, no demand for them that will return real profit above the many costs that build up in their handling. And the weight of their volume in market and storage can slow down sales and depress prices ruinously.

Let each grower figure up each item of cost from picking through selling and put alongside this the prices such fruit brought last season. Let him post this in packing house and office. Perhaps the losses shown will give courage to all who harvest this crop to keep the unwanted apples home, out of storage, off the market, out of the line of march of the fine apples of this splendid crop.

The bands will play, the crowds will come out to see and to enjoy. For apples are on the march!

### EXTRA CROPS PAY FOR THINNING TREES

**S**OMETIMES in setting out an orchard, it's a problem whether to put in filler trees for later thinning or space the trees the proper distance apart in the beginning. Alfred and George Marshall, of Fitchburg, Worcester County, Massachusetts, believe in close setting and thinning later. They find it more than pays them in extra crops.

Back in 1938, they set out one section of their large orchard to Cortlands.

Since then they have picked six crops, each one better than the other. This past winter, after picking and selling a large crop, they cut out every other row of Cortlands. Only the large branches were removed, the trunks were left standing for later removal. When the job is completely finished, the trees will be spaced 34 feet by 48 feet. This gives them plenty of room in which to work with sprayers and other orchard equipment.—C.L.S.

## FROM THE Editor's Mailbag

### Sweet Corn Derby

NOTICED the inquiry as to who had sweet corn earlier than July 22.

We planted Seneca 60 May 1 and began eating July 19. Ears and kernels were well developed and the flavor good. Using the same variety in 1950, we began eating July 23.

1949 we used Sun Up seed and ate the first July 12. However this did not seem to have the flavor of Seneca 60.

This year we made the first planting of our main crop, Seneca Chief, May 9. We shall try the first from this in a day or two. The silk is brown and the ears are quite hard. — Harry M. Fisher, Mohawk, N. Y.

\* \* \*

I CAN come close to you on sweet corn. We picked corn for July 23 and we are several miles north of you on the map. If you should look up Norfolk 'tis way up in St. Lawrence County. It was field planted on May 1—3½ acres.

—Ivan F. Wing, Norfolk, N. Y.

EDITOR'S NOTE: I planted Spancross. It is one of the earliest corns, and from this year's experience it is the highest quality early corn I have ever eaten and the most productive.

—E.R.E.

\* \* \*

### "Bonnie Wee Farm"

THE article in your July 21st issue, entitled "Goodbye, Bonnie Wee Farm," is one of the finest stories I have ever read. It gives the whole philosophy that agriculture is a way of life, not just a job to do.

Here certainly is a man who has led a life on the land that proves he had the right relationship between himself, the land and his God. I know that you will be passing on congratulations to the author, George W. DeRidder, and I just wanted to tell you that I think he deserves all the congratulations you care to give him.—A. F. MacDougall, County Agricultural Agent, Middlesex County, Mass.

EDITOR'S NOTE: Many readers have asked us for Mr. DeRidder's address. He is now living at 77 Church Avenue, Ballston Spa, N. Y., not far from Bonnie Wee Farm.

### No Cream on Travels

WHEN I get on the road I like to eat as nearly as possible as I do at home. So I go into a diner or a restaurant or a hotel and order my cereal "with cream". What do I get? Just a blistering look from the waitress and a statement that they do not have any cream—you moron you—nothing but homogenized milk. My usual retort is that the management ought to pay up their old milk bill so the milkman will leave them some of the better milk products. The reactions I get sometimes keep me amused the rest of the day. I have even had the manager explain in detail why he can't afford to buy cream with me offering to pay for cream.

Now in Ohio, Indiana, Illinois, Michigan, Wisconsin, Missouri, Pennsylvania and the New York Central Railroad, when you say you want cream, by jeeppers, you get cream, particularly in Wisconsin.

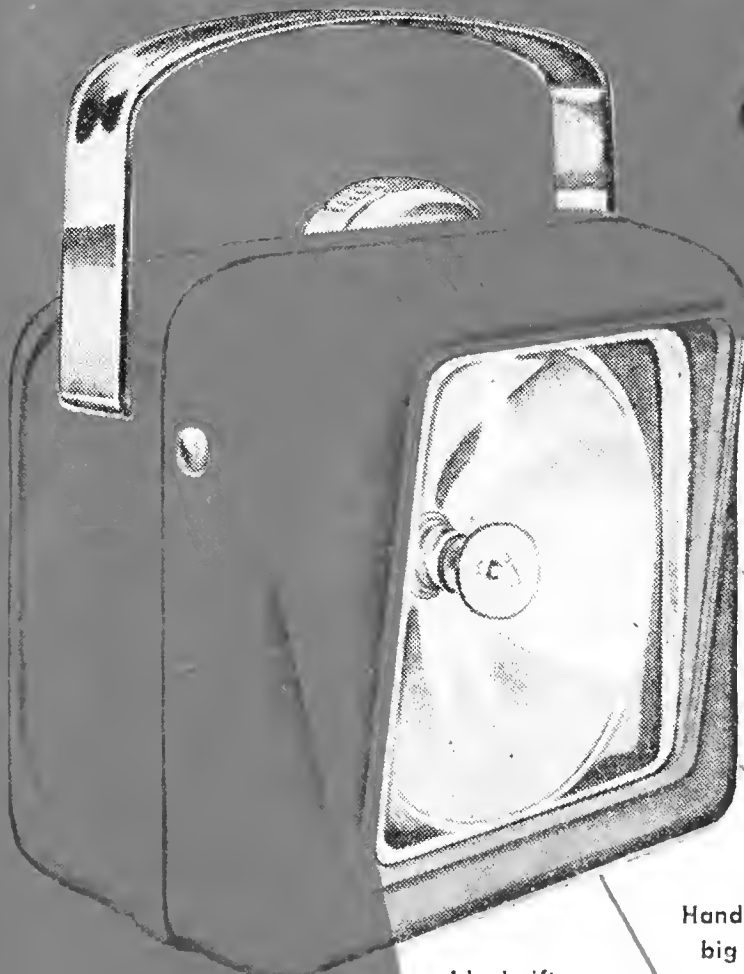

I'm for a cream-raised generation. Costs more but it's worth the price.

—R. C. Burnett, Skaneateles, N. Y.

EDITOR'S NOTE: 'Snothing! Heard a man order coffee without cream the other day and the waiter said, "Sorry we have no cream." The customer asked if he could have the coffee without milk and the waiter said, "Okay. We've got that."

## Peebles' CALF-KIT

(Milk Replacement)

- Calf-Kit has been fed with complete success to over 100,000 calves . . . saves 300-500 lbs. of milk per calf.
- The only milk replacement for calves containing 98% milk serum solids as contained in whey and whey products . . . that's why the change-over from milk is easy for calves to make. Gives "milk fed" results at half the cost.
- Calves get a vitamin boost with Calf-Kit — it contains all the natural vitamins of whey products and is fortified with guaranteed levels of vitamins A, D, and Riboflavin.
- Dairymen don't worry about scours with Calf-Kit. It's the usual thing to develop sturdy, full-bodied heifers on Calf-Kit . . . raises calves with "milk-fed" bloom and vigor.
- You must be satisfied with results from Calf-Kit or your money will be refunded in full. Millions of pounds of Calf-Kit have been sold on this guarantee.

# Some Observations on LADINO

By GEORGE SERVISS

**I**N A short period of years, about twenty in fact, ladino clover has emerged from the grave in the Northeast to become the king of the area's pasture legumes, and also to occupy an important place in our hay fields. Ladino's resurrection in the Northeast was the beginning of a grand march both west and south that has not yet spent its force.

Why ladino was so slow in gaining its just recognition is somewhat of a mystery. It was first brought into the United States from northern Italy shortly before 1900. It was repeatedly tried in the eastern states with poor to mediocre results. About 1912, though, it gained a foothold in the irrigated valleys of the Pacific Northwest. Acreage in that area multiplied rapidly, but it was not until the early 1930's that it caught hold in New England and began its march into the Mid-west and the deep South.

### Fickle Plant

Ladino is still a fickle plant. Usually you have it, but sometimes you don't, even if you follow the practices recommended by the best authorities. With proper liming, fertilization and management, success is the rule, not the exception, and the returns are manyfold. Most likely it was failure to realize these rather exacting requirements that resulted in the numerous failures in the East during the first thirty years of its use in this country.

The ladino clover we are using today is not exactly the same in type as the first introduced from Italy. It has undergone many years of natural selection and there has been some natural crossing with the smaller white clovers. The original type grew taller but not so dense. Imported seed from Italy still produces plants similar to the original introductions. The Italian strain does not appear as winter hardy as the domestic.

There does not appear to be any important difference in winter hardiness between domestic commercial seed from different areas, but plant breeders have found striking differences in winter hardiness among individual plant selections. A few years hence we should have a more vigorous and a more winter hardy strain of ladino for the Northeast.

While I had observed ladino on experimental plots for many years, my first observations of it on a farm scale

were in the summer of 1937 on the farm of Charles Rodriguez at Cropseyville, Rensselaer County, New York, and on the farm of John Holser just a few miles away at Poestenkill. We are not sure which one seeded it first, but to the best of our knowledge these were the first successful farm seedings in New York. Charlie Rodriguez once told me that one of his reasons for seeding it was to prove one of the experts wrong. Shortly before, as we remember, he had purchased a run-down farm on which hardly any crop had been successfully grown for some years. He applied two to three tons of limestone to the acre and 700 to 800 pounds of 5-10-5 fertilizer (according to our old notes). Elton Hanks was then County Agent, and this field and John Holser's were the two show pastures of the county for many years. The last time we saw the Rodriguez pasture it was eight years old and still going strong. Annual top dressings were a large part of the answer to its persistence.

Success with ladino on most soils necessitates adequate use of lime at, or prior to, time of seeding, at least moderate fertilization at seeding time; annual top dressings with a phosphate-potash mixture, such as 0-20-20 or superphosphated manure; early cutting if being utilized for hay or grass silage; avoidance of extremely close grazing in the fall and permitting the crop to reseed itself occasionally, particularly the year after it is seeded. Adequate fertilization is more important than the time of year it is applied. We don't know of any other pasture or hay crop that responds so well to good treatment. While we have used the term "ladino" throughout, in most instances we have meant "ladino—tall grass mixtures."

— A. A. —

### HERD RECLASSIFIED

The registered Ayrshire dairy herd of Silas N. Stimson II, Spencer, N. Y., was recently classified for type by official judge Roger P. Denney, Frederick, Maryland. The herd attained an average score of 829 placing it among the top 10% of the breed on type characteristics.

The Stimson herd of 6 purebreds included two 'Very Good' females which is the second highest rating given any Ayrshire, three 'Good Plus' as well as one 'Excellent' bull. The Stimson Ayrshires comprise one of the 141 classified herds in this state.

## For Your Thoughts. \$50 in Prizes

**W**HAT kind of an America do young people want? Do you who are under 21 years of age look forward to a life of government-guaranteed security, including pensions and unemployment insurance for the aged, the infirm, and the indolent? Do you expect your government to try to keep prices low on what you buy and high on what you sell? Do you want to "run to the government" every time you have a problem?

Or, on the other hand, is freedom worth more to you than security? Are you willing to follow in the footsteps of your forefathers who risked all for freedom? Will you accept the responsibility of making your own security?

Perhaps you hope for some magic that will make America a land where both security and freedom are guaranteed. You cannot have both; a slave, or a bear in a

cage, has security but no freedom. Which do you choose?

What kind of an America do you want for your future? For the best answer to this question, we will send a check for \$20; for the next best, \$15; for the third best, \$10; and for the fourth best, \$5.00.

The winning letters, plus excerpts from others, will appear in the Fourth Annual Forum Issue of AMERICAN AGRICULTURIST on December 1.

Here are the rules:

1. Anyone who will not be 21 until 1952 is eligible.
2. Letters must contain 600 words or less, written on one side of the paper, and preferably typewritten.
3. Mail your letter to Dept. F, AMERICAN AGRICULTURIST, Savings Bank Bldg., Ithaca, N. Y., before October 20, 1951.

# PRICES ARE DOWN AND HERE'S OUR PROOF

Fairbanks-Morse Dealers offer you this page of outstanding values from their complete line of home service products—including three performance-proved products of highest quality at sharpest reductions in prices in years! See these bargains in the store of the Fairbanks-Morse dealer nearest you!

## TODAY'S SPECIAL VALUES!

**SAVE \$19<sup>15</sup>**

You pay only \$127.85 for this 21" reel type power mower, formerly listed at \$147.00

Powered with Briggs & Stratton engine; Alemite lubrication; crucible steel blades and bed knife; reel shaft of 3/4" steel mounted on Timken bearing; 10" semi-pneumatic tires; roller is in sections for easy turning; heavy gauge chain guard; handle adjustable to operator's height; all controls within easy reach. Fine for average size smooth lawns.

**SHALLOW WELL EJECTOR WATER SYSTEM**—self-priming; bronze impeller on stainless steel shaft; no belts or gears to wear out; 1/4 hp. motor; 42 gal. tank; pressure switch; John Crane seal prevents leakage; pumps 600 g.p.h. at 10-foot suction; 400 g.p.h. at 20-ft. suction. For average family use. Model 650M42. . . . . \$141.75

**WATER SOFTENER**—single tank model. Big enough for family of 5 or 6. Available in 3 grain exchange capacities, 30M, 45M, 60M. Uses Zeolite softening agent. Three-way valve permits finger-tip control of regenerating cycle. This model, 30,000 grain exchange. . . . . \$171.60

**CELLAR DRAINER**—all-bronze unit; 1/3 hp. motor; fully automatic; easily installed; comes ready for use—just plug it in; protects furnace, water heater, power generators, furniture, and other things stored in basement. Model 49B. . . . . \$77.00

**WASHING MACHINE**—Fairbanks-Morse reliable standard model. Full 23-inch tub; long drain hose; full size wringer with safety release; all mechanical parts enclosed by protecting skirt; completely rubber cushioned; finished in white enamel; anti-splash rim. Model 349E. . . . . \$139.95

**DEEP WELL EJECTOR CONVERTIBLE PUMP**—most pump for least money we've ever heard of! Use it as shallow well until you need to go deeper to reach supply, or need more water. Then install simple conversion kit, and you have a deep well pump! Install over well or away from it. Model shown delivers 410 g.p.h. at 20 ft.; comes ready for use, with 42-gal. tank. Model 253M42. . . . \$177.20

**LIGHT AND POWER**—for homes, farms, sawmills, canneries, etc. From 600 to 40,000 watts. Manual, remote or automatic starting. AC or DC. For portable or permanent installation. This model 3,000 watts AC manual starting, \$721.00

**SAVE \$36<sup>50</sup>**

You pay only \$205.00 for this 24" de luxe rotary power mower, formerly listed at \$241.50

Self-propelled power mower; rotary disc mounts 6 mower blades and can be reversed to present new sharp edges; 2.5 hp. engine; cuts 24" swath; cutting height adjustable from 1 1/2" to 5"; mounted on semi-pneumatic tires; operates 4 to 5 hours on 1 gal. fuel. Safety guards. All controls on handle. Ideal for uneven lawns, weedy parkways.

**WATER HEATERS**—Electric model shown here, 40-gallon capacity; double heating elements; temperature controls; cold water trap; 3" Fiberglas insulation; magnesium anodes protect inside tank; over-temperature protector; finished in white enamel. This model. . . . . \$138.90

**NEW SUBMERSIBLE PUMP**—entire unit, including motor, is completely submerged. Water cooled, water lubricated. Delivers high volume of water at depths from 60 to 400 feet, depending upon model. Self-priming. Easy to install, simply add pipe lengths to depth of water. No jets, rods, shafts. No noise or vibration. Model S-50-90. . . . . \$325.30

**SAVE \$10<sup>00</sup>**

you pay only \$72.50 for this De Luxe Ironer, formerly listed at \$82.50

Lightweight; compact; roller 21" x 6"; large heating shoe; thermostatic heat controls; air cooled motor; needs no lubrication; guide springs return clothes without wrinkling. Wings fold down at sides for storing; complete with de luxe stand.

# Identical Twin Heifers used in Amazing Feed Test\* at DAWNWOOD FARMS

**CANDY on Milk**  
gained 103 lbs. in 3 months...  
COST **\$57<sup>33</sup>**

**SANDY on CAF-STAR**  
gained 112 lbs. in 3 months...  
COST **\$14<sup>95</sup>**

\*Test conducted under normal dairy farm conditions. Weights taken monthly by E. Van Steenburgh, D.H.I.A. supervisor.

We take pride in the calves we raise on our farms. That's why we created CAF-STAR. When the identical twin heifers, Candy and Sandy, were born, we made the famous feed test which proved that CAF-STAR helps develop bigger animals with better bone growth—and at a big saving. We feel that all dairymen should know about CAF-STAR.

Cordially,

*Dawnwood Farms*

Just mix CAF-STAR with water and feed quart for quart instead of milk. The 25-lb. package feeds a calf for one month at a cost of 16 cents per day.

Buy at your feed dealers in 25-lb. bags or 100-lb. (economy) bags. (Metal pails sometimes available.)

## SEE THE FAMOUS TWINS AT THE FAIRS!

CANDY and SANDY, also other identical twin calves used in CAF-STAR feeding tests, will be on display at

Vermont HARTLAND Fair Aug. 23-24-25.  
New York DUTCHESS CO. Fair Aug. 28-Sept. 1st  
New York State Fair, SYRACUSE Sept. 1-8.

## 2,500 At Annual NYABC Meet

J. STANLEY EARL of Unadilla was re-elected president of the New York Artificial Breeders' Cooperative, Inc., at the recent 11th annual meeting of the dairy cattle artificial breeding organization in Ithaca. Other officers re-elected were George Pringle, Nichols, N. Y., vice-president, and Glenn Widger, Ellicottville, N. Y., secretary-treasurer. About 2,500 dairymen attended the all-day program which featured a morning competitive cattle show in addition to the afternoon business session held at the cooperative headquarters.

J. STANLEY EARL

Earl, Lyle Wicks of Oxbow, N. Y., Harold L. Creal, Homer; Michael Jamba of Jefferson, N. Y., and Alex Rabeler, Sr., of Bovina Center, N. Y., were re-elected directors.

Delegates representing 68 local affiliated artificial breeding units in New York State and Western Vermont voted not to supply beef breeding service through their organization. Proposed amendments to the by-laws were approved, including one to restrict the number of capital assessments paid by a member to a maximum of 10.

### Now 36,083 Members

Manager Maurice W. Johnson reported to members a new high in the number of first services to NYABC sires with 212,147 cows bred during the past fiscal year; and a new high in total number of members—36,083. He also reported a 36 per cent increase in volume of business for the first two

months of the current fiscal year as compared to the same period a year ago.

The morning was devoted to a cattle show in which 169 female animals of the five major dairy breeds competed in 33 individual classes for a total of \$3,232 in premiums and prizes.

Kurtzhurst Ormsby Posch Colan, sired by Chief Piebe Count Pride Gerb Colan J., exhibited by Vincent G. Kurtz of Livonia, N. Y., was the Grand Champion Holstein. Maple Lawn's Baron Daisy, sired by Douglaston Baron Kenyon, and shown by Sherman Lake, Lyons, N. Y., was Grand Champion Guernsey.

Grand Champion Jersey was Cornell Eclipse Joybell, sired by Masterman Standard Eclipse and shown by Cornell University. Milton Ward of Delhi, N. Y., was the owner of the Grand Champion Ayrshire, Natalie of Cold Spring, sired by Holholm Early Louis. Brown Swiss Grand Champion was Cornell Windsor Kata, sired by Cornell Columbus Windsor and exhibited by Cornell University.

A free box luncheon, prepared by the Tompkins County Home Bureau, was served by NYABC, and the afternoon business session featured an address by Dr. W. E. Petersen of the University of Minnesota, on Better Breeding for Dairy Cattle and Better Use of Forage. He told the audience that artificial breeding "offers greater potential than anything that has ever come into this most important industry."

Quoting his experiences and studies of roughage growing in his home state, in England and in New Zealand, Dr. Petersen urged more emphasis on per acre and per man-hour forage production on farms in this area.

Kurtzhurst Ormsby Posch Colan, sired by Chief Piebe Count Pride Gerb Colan J., exhibited by Vincent G. Kurtz of Livonia, N. Y., was Grand Champion Holstein at the NYABC Cattle Show.

## THE QUESTION BOX

Is this new plastic pipe I hear about for water systems satisfactory?

The information we have indicates that it is working very satisfactorily. Fittings are available which make it unnecessary to have threads on the pipe. No special tools are required to install it and it is resistant to corrosion. It is easy to install because it is relatively light in weight and it is flexible so that it can be lowered into and raised from a well with relative ease.

There is one caution which should be observed. It expands and contracts more than metal pipe. Therefore, when you put it in a ditch, run it in a wavy line rather than a straight line. This will give it opportunity to expand and contract.

\* \* \*

Have attempts to keep foxes away from chicken ranges by electric fences been successful?

Yes, with some reservations. It is necessary, for example, to keep the vegetation down or it will "short" the fence. One way is to spray the ground under the fence with furnace oil. One

method used is to make a double fence, the lower wire being about 6 or 7 inches from the ground and charged, while the other wire (uncharged) is 6 to 8 inches higher.

\* \* \*

Does a home freezer freeze food rapidly enough to give top quality?

The Geneva Experiment Station at Geneva, N. Y., says that the rate of freezing usually found in home freezing units will give satisfactory quality. However, they caution against stacking packages to be frozen too tightly in the freezer as this slows up freezing in the center. After they are frozen they can be packed tightly.

\* \* \*

What's the recommendation for controlling Japanese beetles in the home garden?

DDT seems to be the best control. Use 1 teaspoonful of 50% DDT wettable powder to a quart of water. The spray is recommended because it seems to stick better than dust. Where DDT is used on bearing fruit trees, they should be sprayed not later than 2 weeks before the fruit is picked.

# CHEVROLET

## Advance-Design Trucks

(Continuation of standard equipment and trim illustrated is dependent on availability of material.)

## Built for Your Loads ... and Your Roads!

You have your own hauling problems on your farm . . . your own loads, your own roads. And Chevrolet makes sure you get the truck that suits your needs. Right power, right body and load capacity, right wheelbase . . . including the new 179" wheelbase chassis that handles special bodies up to 16 feet long.

Take a look at the Chevrolet platform truck shown above. Great for moving machinery and equipment, hauling baled hay, feed and other commodities. Comes in 10 different models, handling payloads from 2000 lbs. to 10,700 lbs. Tough, durable hardwood planks in platform are uniform in width—easy and economical to replace—with flush-type skid strips and stake pockets. Rugged channel type frame for field work and rough

roads. Single-unit axle housing, extra-capacity springs and axle. Right power for your needs, too . . . Thriftmaster or 105-h.p. Loadmaster engine. And if you need it, you can get a 2-speed rear axle, optional at extra cost (series 5000 and 6000). Cabs are rugged all-welded construction, with plenty of room and comfort.

You'll sure like the way this Chevrolet truck handles—recirculating ball-type steering, Synchro-Mesh shifting, self-energizing brakes. That goes for *all* Chevrolet trucks . . . pickups, panels, platforms, stakes, conventional and C.O.E. chassis for special bodies. Talk over your hauling or delivery needs with your Chevrolet dealer. Chevrolet Division of General Motors, Detroit 2, Michigan.

MORE CHEVROLET TRUCKS IN USE THAN ANY OTHER MAKE!

### Lowest Priced Line

Quality through and through—at a price that saves you money. Chevrolet builds the lowest priced line of trucks in America today. You pay less, get more.

### Low-Cost Operation

Economical is the word for Chevrolet trucks. Their high-efficiency Valve-in-Head engines cut gas and oil costs . . . save you money every mile.

### High Resale Value

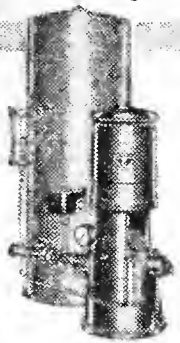

Over the years, Chevrolet trucks have brought higher trade-in allowances than other trucks in their price field. That's because greater value is built in!

**Check Chevrolet's Advance-Design Truck Features:** TWO GREAT VALVE-IN-HEAD ENGINES—the 105-h.p. Loadmaster or the 92-h.p. Thriftmaster—give more power per gallon, lower cost per load • POWER-JET CARBURETOR—smooth, quick acceleration • DIAPHRAGM SPRING CLUTCH—easy-action engagement • SYNCHRO-MESH TRANSMISSIONS—fast, smooth shifting • HYPOID REAR AXLES—dependability and long life • NEW TORQUE-ACTION BRAKES—on light-duty models • PROVED DEPENDABLE DOUBLE-ARTICULATED BRAKES—on medium-duty models • NEW TWIN-ACTION REAR BRAKES—on heavy-duty models • NEW DUAL-SHOE PARKING BRAKE—on heavy-duty models • NEW CAB SEAT—complete riding comfort • NEW VENTIPANES—improved ventilation • WIDE-BASE WHEELS—increased tire mileage • BALL-TYPE STEERING—easier handling • UNIT-DESIGNED BODIES—better construction • ADVANCE-DESIGN STYLING—increased comfort, modern appearance.

# Lee Weaver is Now Practising What He Preached !

**H**OW FAST the days sweep by! Four months have passed since I retired from my job in Poultry Husbandry at Cornell University and began this life of freedom and leisure—and now it is Fair time with the days becoming noticeably shorter, yet I have not made any report in this column on the progress of my farm and poultry venture as I promised I would.

Many good friends have asked, "How does it seem to be a person of leisure?" Or the question may be worded, "How do you like being your own boss?" or, "Do you enjoy being able to do as you please?" Always the inquiries are friendly and are asked with an expectant smile. My reply goes something like this:

"I am having a wonderful time. It's a lot of fun. So far there's not a thing to complain about. Even the weather has been on my side. But I must put you straight on this matter of freedom and leisure and being your own boss. When 4,000 always-hungry and constantly-expanding chicks are depending on you for their feed and care, no leisure or freedom is possible. They are the boss and it's your own pocket-book that is hit if you go on strike, or even do any slowing down."

## Has Good Luck

None the less, retirement has been a fine adventure so far. I have the usual coat of tan, the bay window has receded a bit, my wind is much better, I could go up those new stairs two steps at a time but I don't, and how I do sleep! (Sometimes with vocal accompaniment I am told).

Another retired old-timer has rallied to my assistance and together we have accomplished a lot of things I had hoped to do, and a few that were unpremeditated. We got the three-story poultry house cleaned out in time to get the last load of fine, dry, granular built-up litter spread on the corn ground just ahead of the planter. Also just in time to get the lower floor and hot water brooding system ready on May 23 for 4,180 chicks, plus the extras which were not counted.

Then began a contest against time to replace the feeders and waterers with larger ones as fast as the chicks outgrew them, and still not have to use any in which the feed could be wasted. We did it. There has not been enough mash scratched, billed or dusted into the litter to mention. There just couldn't be when it was costing better than a nickel a pound.

The toughest job, however, and one that isn't finished, has been to get more floor space ready as fast as it was needed. The stairs that were orig-

inally put in that old remodeled barn had become much steeper than they were 20 years ago, and since we had moved the feed room the stairs were in the wrong end of the building. Now we have an easy and wide stairway from the first to the second floor, with 10-inch treads and 6-inch risers.

## Pullets Are Crowded

The pullets have been on the second floor long enough that they are again terribly crowded. I should have been working on the stairs from the second to the third floor this week, but how could I stay away from the Poultry Get-Together at Cornell, and that terrific barbecue supper at Bob Marshall's farm? And now there are 30 acres of oats that will have to be combined in a few days, and it will take at least a day to get a place ready for them. Those pullets will just have to wait a little longer and crowd together a little closer, until I can get that top floor ready for them and the stairs finished.

It is easy now to see why people seemed to pay so little attention to what I used to tell them as a professor. Didn't I point out time after time that overcrowding is very, very bad. That it is the root of many evils? That wet litter, feather pulling, uneven growth, may lead to cannibalism? Of course I did. I presume that my listeners in many cases got around eventually to do something about it, just as I hope to do.

Another matter that needs immediate attention is to decide how I can dispose of about 1,800 White Rock broilers to best advantage. I may want to produce some hatching eggs, so am going to hold back about 200 males. Losses have been quite low and it is a real sight to see 2,000 red-combed, bright-eyed white heads massed expectantly in the late afternoon when it's time for the feeding of whole corn, yet I am a bit disappointed in the weights of those cockerels. They were 10 weeks old yesterday. I hear of flocks that average 3½ pounds at 10 weeks. A few of these will go 3½ pounds, but the average wouldn't be more than 3 pounds. Plenty of them won't go above 2½ pounds. What is the reason? Not enough room? I have seen broilers packed in closer than these are. Is it the hot weather? Or am I expecting too much?

I would like to go on and tell of the startling effect of that poultry fertilizer on the corn crop, the trouble-free, labor-saving water supply that Johnson waterers have given since the chicks were ten days old, how quickly the chicks learned to eat whole corn, and the wasteproof improvised mash-feeders that have come to be permanent fixtures. Perhaps I will when I get that extra floor space ready!—L.E.W.

Turkeys don't get their feet wet and neither do they get in the droppings since Raymond Reed, of Andover, Essex County, Massachusetts, installed wire frames for use under automatic drinking fountains.

His frames are easily constructed of scrap lumber and turkey wire. Instead of installing common water pans, he used tubs to minimize the dangers of overflowing.—C.L.S.

The new corn drier at Genoa, Cayuga County, N. Y., built to serve the largest corn-for-grain area in the state. Insert is picture of one of owners, Henry Stack, popularly known in the area as Henry Stack.

## Central New York Has New Corn Drier

By F. HELEN MACLEAN

AT GENOA, in Cayuga County, New York, a giant corn drier similar to those used in the great grain-producing areas in the middle West was recently completed. It was built by Stack and Turek, Inc.

Henry Stack, a graduate of the State College of Agriculture at Cornell and a former teacher there, served as a Major in the Air Force, as an instructor, flyer and navigator in the South Pacific during the last war. When the fight was over he returned to Cornell for a Master's Degree, then together with Walter Turek, his brother-in-law, he founded the present firm in the fall of 1947. For the past 3 years he has conducted the business alone while Walter has been operating a large poultry and crop farm in King Ferry.

Cayuga County, New York, is the largest corn-for-grain area in the State. Last year, in spite of a wet season, County Agent Charlie Nesser says the crop totalled 400,000 bushels. As long ago as 1942 the estimate was 472,000 bushels.

This shows one reason for the location of a corn drier in the County. But perhaps more important, the drier located on Route 34 just north of the village brings to farmers in the area new modern facilities for harvesting corn as a cash crop and eliminating months of delay and losses incurred when drying corn in cribs. Incidentally, the drier is an 84x24 two-story building and reaches 74 feet into the sky.

The drier, which was manufactured by the Campbell Company of Des Moines, Iowa, also provides a portable corn sheller with which corn may be shelled in the field before it is trucked to the plant. This arrangement with its time-saving features, is to the mutual advantage of both plant and farmer. Speed, points out Henry Stack, is the keynote of the whole proceeding. Immediately upon its arrival, the corn is scientifically tested for moisture in a matter of a few minutes. When the moisture is about the normal 20 per cent, it is dried to 15. But last year, due to an unusually wet season, corn showed anywhere from 26 to 49 per cent moisture with an average of 36.

Following the moisture test and screening, the grain is weighed on an automatic scale, then elevated to the

drier. The process is so mechanized that a kernel of corn travels 500 feet before it leaves the plant. Including screening it takes about 2 hours and 50 minutes to dry the corn unless the moisture content is excessive.

The drier which is heated automatically by oil will handle 200 bushels an hour, but it is so constructed that the capacity can be doubled when needed.

It is planned that corn from some 4,000 acres will be dried this fall. Wheat also will be handled. These new corn drying facilities will make it possible for a grower to get his money immediately upon harvesting the crop.

### It's Handy

#### CRACK FILLER

Some farmhouse floors have wide cracks. These can be filled in this manner. Soak newspapers in strong alum water until a soft pulp is formed. Fill the cracks with this pulp, pressing it down firmly and smoothing it off; then let it dry thoroughly and it will hold paint and last indefinitely.—C. E. Swender, Des Moines, Ia.

Two hexagonal nuts can be used as a gauge for grinding drills to the proper angle for most common metals.

—Edward Monroe, Schuyler Lake, N.Y.

Good living for the cows means good living for the family. Here Crawford Dohnken's herd fills up on millet, which Crawford figures is a better crop for him than sudan grass.

## Good Living on Green Acres

(Continued from Page 1)

time for outside activities, including an occasional few days off to go hunting in the fall.

When County Agent Matott introduced me to George Comings and his son Phillip, partners on a farm of 103 tillable acres in Chenango County, I asked George what effect better grass has had on his family living. He answered that their farm, despite its relatively small size, was providing for two families very comfortably. "We raised seven on this farm, and now Phillip is married and has three chil-

from the Comings' place. Russell's operation shows that *you don't have to have a big farm to cash in on the results of good planning and good management*. He has only 50 acres with 18 acres of improved pasture and 18 of hay, but for the past six years he has followed carefully a program of better seeding, higher fertilization rates, and well thought out management.

A strong back and lots of energy are necessary in farming, but those things alone don't spell success. These Chenango and Broome County men, and thousands more participating in Green Acres, Green Pastures and other better roughage programs throughout the Northeast, have planned their dairy program to take full advantage of our natural grass-growing country. Through good management they are finding success, as well as more free hours to devote to "living" and more income to give their families a better life.

— A.A. —

### FLOWER FANCIERS TO COMPETE FOR \$6,000 AT NEW YORK FAIR

Flower fanciers throughout the state —professional and otherwise—will compete for state championships in more than half a hundred classes at the 105th renewal of the New York State Fair, Syracuse, September 1 to 8.

The New York State Agricultural and Industrial Exposition, which annually draws hundreds of thousands of persons to Central New York has provided \$6,000 in premiums for this year's flower show. Kenneth Post, of Ithaca, is superintendent of the Flower Department.

Competition is open to all plant and flower growers, professional and non-professional. Three sections have been set up with the non-professionals exhibiting in Section 1, Garden Clubs in Section 2, and anyone in Section 3.

Entries in the Flower Department close August 22. Premium books may be obtained by writing to: Director, New York State Fair, Syracuse, New York.

— A.A. —

### 1,200 AT BARBECUE

BEST attended session of the recent two-day New York State Poultrymen's Get-Together at Ithaca, New York, was the broiler-barbecue cooked and served on the spacious lawns of Robert Marshall near Ithaca. Marshall Brothers Hatchery was host to 1,200 guests who consumed 800 broilers and all the fixin's.

Russell Smith, above, says improved pastures and hayland are essential when you have only 50 acres. He gets machinery efficiency by purchasing equipment in partnership with a neighbor who also has a small farm.

dren of his own. We are 100% grass and like it."

Grass silage, put up in the spring with 60 pounds of molasses to the ton, is fed out even when the cows are on pasture in the summer. "And you'd be surprised how much they eat," George said. In the fall the silo is refilled with soybeans.

"Good grass has played a big part in production," George told me and then added that last year the herd of purebred Holsteins averaged 467 pounds of fat.

Five well-managed pasture fields on the Comings farm total only 20 acres, but by using one of three meadows for aftermath grazing, they have ample good pasture for 16 head of heavy producers and 17 head of young stock.

That good roughage is like money in the bank was demonstrated again at Russell Smith's farm, just a few miles

# Their Chocolate Cakes Take the Prizes

By MABEL HEBEL

**T**HE excitement of hearing that her chocolate cake had been judged the best in the Broome County Pomona chocolate cake contest was almost too much for Mrs. Emmerich Bares, Jr., of Binghamton, N. Y., R. D. 1, and caused her to burn a batch of shortcake biscuits.

"My family had quite a laugh over that," she says, "—winning a cake contest and then burning the biscuits!"

The contest won by Mrs. Bares was one of the county elimination contests in the big statewide chocolate cake contest which is being currently sponsored by AMERICAN AGRICULTURIST and the New York State Grange. Winners of hundreds of Subordinate Grange contests are now matching cakes in the county contests to determine who will go to State Grange next fall and take part in the contest finals.

The stakes in the finals are high—\$159 in entry prizes from the State Grange; \$100 from AMERICAN AGRICULTURIST, and a slew of valuable prizes from ten AMERICAN AGRICULTURIST advertisers—American Sugar Refining Company; Walter Baker Division of the General Foods Company; Cooperative G.L.F. Exchange; R. B. Davis Company; General Foods Sales Co.; Certo Division; Hazel-Atlas Glass Co.; International Harvester Co.; International Milling Co.; Kalamazoo Stove and Furnace Co.; and the Speed Queen Corporation. Several of these companies are also giving prizes to winners of the county contests.

The winner of the Washington County Contest, Mrs. Elton Borden of Schaghticoke, N. Y., and a member of Easton Grange, proved that she can bake a chocolate cake that is just as perfect as her gingerbread which made her the top State winner in our gingerbread contest in 1948. Two of the cakes entered in the Washington County contest were baked by Grange brothers, and one of them (Howard Vanier of Battle Hill Grange) tied for third place! His success made the news in a big

way. Both the Grange Monthly and the Associated Press carried the report, with the result that Mr. Vanier got newspaper clippings about it from all over the United States. The other Grange brother who entered the contest was Leon Duel, Mettowie Grange's first prize winner. Mrs. Duel, who also competed in the Mettowie Grange contest, took third place—and a lot of kidding.

Every Subordinate Grange in Oneida County was represented in the County contest, won by Mrs. Owen Cunningham of Munnsville, N. Y. Pomona chairman Mrs. Ernest Burke of Sherrill, who had charge of the County contest, wrote us: "Mrs. Cunningham is a very active member and chairman of most of our large

Granges. She raised a family of her own, educating all of them, and then raised another family of seven whose mother died. She's a wonderful cook and a grand person!"

In Essex County, a 17-year-old high school senior stole the show — Miss Barbara Simpson of Whallonsburg, N. Y. Barbara says it was a big surprise to be the winner, and a thrill. Besides entering the chocolate cake contest finals in the fall, she is going to enter the New York State Foods Contest at the State Fair next month.

Pomona chairmen in all counties where the contest has been held so far tell us of the wonderful cakes baked by contestants. Here is a list of Pomona winners whose names have been reported to us during the past few weeks:

## POMONA WINNERS

County	Grange	Winner
Broome	Hawleyton	Mrs. E. J. Bares, Jr.
Delaware	Delhi	Mrs. Paul Baylor
Greene	Greene Valley	Mrs. Joan Bouton
Jefferson	Adams Center	Mrs. Mabel Fortune
Montgomery	Florida	Mrs. John Holloway
Ontario	Canandaigua	Mrs. Richard Smith
Putnam		
Westchester	Brewster	Mrs. Edward Roth
Ulster	Plattekill	Mrs. Alfred Wager
Schoharie	Rock District	Mrs. Kenneth Bellinger
Suffolk	Sound Avenue	Mrs. Vernon Wells
Washington	Easton	Mrs. Elton Borden

Mrs. Emmerich Bares, Jr.  
—she burned her biscuits.

Miss Barbara Simpson  
—youth no handicap.

Mrs. Owen Cunningham of Munnsville, N. Y., winner of Oneida County's chocolate cake contest: "An active Grange member, a wonderful cook, and has raised two families—her own and a motherless family of seven."

Washington County's winner, Mrs. Elton Borden of Schaghticoke, N. Y., who now has a chance to duplicate her achievement of three years ago, when she was state winner in the gingerbread contest.

FARMERS TOLD US:

"We want  
**BOTH**  
FM and AM!"

Super-powered

**FM-AM RADIO**

**W**HEN you live in the country, extra power and freedom from static are more important than ever in a radio. That's why farm families want *both* FM and AM. This beautiful new 2-in-1 model brings you famous General Electric FM radio with crystal-clear reception, virtually free from static, fading, station interference. *Husky 7-tube chassis actually outperforms many consoles!* Powerful AM radio, too, for standard broadcasts. Full-size G-E Dynapower speaker for magnificent tone. Rich, modern mahogany plastic cabinet, highlighted by a big, gorgeous "sunburst" dial. What an ideal radio for the farm—for *your* farm! See G-E Model 408 today—it's the finest table radio G.E. ever built! **\$54.95\***

General Electric Company, Electronics Park, Syracuse, New York.

\*Price subject to change without notice.

By J. F. "Doc" ROBERTS

**W**ITH the abundant rough feeds that we now have, and with the prospective corn and small grain crops, particularly oats, that are so good, the problem of feeding or not feeding livestock this winter is still a guess, although much simpler than usual.

Congress has gone into a never ending cycle of more taxes, more money for Congress to spend, causing more pay increases with less money for the public to spend with every tax increase. This assures a great deal of money in circulation even though food is the political "goat." It looks now as if between more votes and more money, the farmer will have to take his bumps; but he still knows from experience that cheap food and high incomes just do not go together, whether by legislation or any other cause.

With this in mind and with all our feed in the Northeast, growing livestock is a "must" for this winter. I do not believe it makes too much difference what species you feed as long as you like it and understand it.

In spite of peace talk, and all that it implies, we are committed to a long, high costing, and full-employment defense effort. Given the money, we know people will eat well. I can see no real break in food prices—particularly meat—in the next year or two.

Nevertheless, regardless of what Washington may try to do, I do anticipate sharply fluctuating livestock prices over short periods. This is always true in times of so-called emergency, probably largely because the government is an in-and-out buyer for very large quantities of food.

It could be that the usual "fall" break in livestock prices will materialize, particularly with the corn crop in the West none too promising, coupled with the disasters they have been through. This could bring quite a lot of animals to market this fall, and if you are planning to purchase some young growing livestock, perhaps there is no hurry in getting it.

Now for my wheat grazing experiment of a year ago which ended this week. Remember I planted winter wheat in July and about September 1 turned a bunch of heifers on it? I was

planning to graze it again this spring and still combine the wheat this August.

The wheat made a wonderful growth, and the heifers did fine on it last fall although I left them on it until the last week of November when it was fed down very closely. The wheat did not winter kill; it came out fine early, but this spring it was too wet to put the heifers back on it. I had seeded alfalfa and smooth brome grass with the wheat last July, and both of these began appearing above the wheat about the middle of June. The brome grass eventually grew away above it, and this condition continued until this week when we combined the wheat and got a very poor yield.

Now the questions arise: Should I have planted the wheat alone as they do in the West? Should I have grazed it off again this spring to have reduced the growth of the legumes? Is it not good practice in the Northeast to plant growing wheat early and allow it to be grazed late in the fall? I would be pleased to have your answers or, better yet, your experiences.

Fall pasturing anywhere on the farm to my way of thinking is economically sound. Animals do well in the fall and go into the barns healthier and in better flesh than when handled in any other way, providing of course your after-feeds are as good as they usually are in the Northeast. The good the heifers got grazing on the wheat last fall took the sting away from the poor yield this summer, and the seedings are so good I am going to graze them this fall.

— A.A. —

**HERD CLASSIFIED**

**F**AIRLAWN Farms' Guernsey herd at Port Chester, New York, after being judged and rated by L. V. Wilson, Owatonna, Minnesota, has received the following official classifications: 12 Excellent, 24 Very Good, 7 Desirable, and 1 Acceptable.

Among the 12 Excellents in the herd owned by S. L. Katz and managed by Earle B. Hopper, is Coronation Melinda, purchased by Katz in 1950 for \$31,000 in the Sterlinggold Dispersal, Stamford, Connecticut. She is the highest priced cow of the breed.

Fairlawn Farms' herd is one of the best Guernsey herds of its kind in the country. Others high in classification studies are: McDonald Farms, Cortland, New York where last year there were 13 cows Excellent, 66 Very Good, 65 Desirable, 18 Acceptable, and 1 Fair; and Curtiss Candy Company, Cary, Illinois where 12 cows were graded Excellent, 24 Very Good, 18 Desirable, 4 Acceptable, and 2 Fair.

**EASTERN CIRCUIT ABERDEEN ANGUS SALES**

**A**PPROXIMATELY 350 head of outstanding Aberdeen Angus cattle will be sold at the five important sales on the Great Eastern Circuit which begins Friday, September 7, and continues Saturday, September 8; Monday, September 10; Tuesday, September 11 and Wednesday, September 12.

Starting September 7 at White Gate Farm, Flanders, New Jersey, Eugene Denton, owner, is offering 56 cows, 37 heifers, 14 bulls, 22 heifer calves at side of dam, and 20 bull calves at side of dam.

The sales continue Saturday, September 8, at Shadow Isle Farm, R.F.D. 1 Red Bank, New Jersey. Dr. and Mrs. Aimand Hammer, the owners of Shadow Isle Farm, have an excellent line-up for this sale, consisting of 68 head—8 bulls and 60 females.

Continuing, the Sales Circuit moves from Red Bank up to Dutchess County, N. Y., Monday, September 10, to Mole's Hill Farm, Millerton. The Dutchess County sale is the oldest one of the Circuit and has developed a great reputation over a period of years. The

breeders have promised a unique and unusual program, starting at 10:00 a.m. Monday, to take the place of the usual pre-sale judging. Sixty head of females will be sold, including Dutchess County Sale Plan Heifers from out-of-county consignors who purchased these dams in previous Dutchess County Sales.

The following day, Tuesday, September 11, Rally Farms, Millbrook, N. Y., F. H. Bontecou, owner, and Obed Potter, manager, are offering 46 heifers and 4 bulls.

The final sale of the Circuit takes place Wednesday, September 12, at Cochran Farm, North Salem, New York, Gifford Cochran, owner.

To reduce the burden of managing the sale, a new system has been evolved. Instead of a sale manager this year the Dutchess County Breeders have a Sale Committee made up of Myron Fuerst, chairman, in charge of catalogs; Theodore Ryan, advertising; Bill Landauer, hospitality and transportation; and Lee Leachman, sale mechanics.

**WHY BUY MARLOW?...**

**MARLOW WATER WIZARD CENTRIFUGALS ARE YOUR BEST SPRINKLER IRRIGATION PUMP BUY BECAUSE --**

1. Marlows are designed especially for irrigation.
2. Marlows are the only irrigation pumps delivered completely equipped.
3. Marlow makes the world's most complete line of sprinkler irrigation pumps.
4. Marlows are sold and serviced from coast to coast by leading irrigation equipment distributors.
5. Marlows are backed by over a quarter century of specialized experience in producing quality pumps.

No other pump offers all these advantages. If the question is sprinkler irrigation pumps, Marlow is the answer.

# Put Up a Pretty Pickle

By ANNA ROGERS WILLMAN

**A**MONG my memories of good meals partaken of are recollections of Aunt Maria's superb watermelon pickles and my mother's pickled peaches. They were always brought forth for "company dinners" and were the sign of a meal prepared with special care—as well they might be, for a good pickle is a labor of love and a product to be proud of.

The first rule in pickle-making is to select firm, fresh, unbruised fruits and vegetables, and use them as soon as possible after picking. The kind of salt you use is important, too. Never use iodized or free-flowing table salt, as the substance added to it to prevent caking will interfere with brining and pickling. For best results, use pure granulated salt.

Whole spices should be used, as they are less apt to darken the pickles, and also they keep their flavor longer. It's a good idea to tie the spices loosely in a thin white cloth bag large enough so the juices can circulate freely and draw out the flavor. Remove the spice bag before putting the liquid over the pickles.

A good, clear standard vinegar, free from sediment or "mother," is needed to make good pickles — and even the water you use makes a difference. Soft water is best for brine, inasmuch as hard water, especially if iron is present, may cause pickles to darken. If you have to use hard water, boil it 20 minutes and allow it to cool and settle before using.

If your sweet pickles sometimes shrivel and lose their crispness, it may be that you are using a too heavy sirup at the beginning of the pickling process. The first liquid added may be only vinegar, or it may contain a small amount of sugar. More sugar may be added at given intervals until the desired sweetness is reached.

Pickles keep best if sealed in airtight containers. Glass jars with glass tops are best. Metal tops may be corroded by the acid of the pickles. Pickles will keep for a couple of months in an unsealed container if you keep them cool and exclude the air. A coating of paraffin or mineral oil on top of the brine will help keep out the air. Use a cover with a weight to hold the pickles under the pickling liquid.

## BRINED OR CURED CUCUMBER STOCK

When the cucumbers are cured and then made into pickles, the pickles are usually crisper and nicer than those made from fresh cucumbers. You will need:

4-gallon crock, or paraffined wooden container

16 lbs. or about  $\frac{1}{3}$  bushel cucumbers (small or medium sized)

8 quarts brine, made of 8 quarts of water and one pound ( $1\frac{3}{4}$  cups) cooking salt

$4\frac{1}{4}$  lbs. salt ( $\frac{3}{4}$  lb. to be added each week for 5 weeks)

Paraffined board to fit inside crock

A glass jar or bottle filled with water to use as a weight

Clean cloth about 6 inches larger than crock top.

Dissolve 1 pound cooking salt in 8 quarts of boiling soft water. Cool.

Select round, firm cucumbers with  $\frac{1}{4}$  inch of stem remaining. Wash and pack into the crock.

Cover the cucumbers with the cold brine and put the paraffined board on top. Place the weight on the cover to

hold all the cucumbers below the surface of the brine, but do not let the brine come over the lid. Tie the cloth over the top of the crock and set it in a warm place (65 to 70°).

Since the brine is steadily diluted by drawing juice from the cucumbers, salt must be added. At the end of one week, and of each succeeding week for 5 weeks, place  $\frac{3}{4}$  pound of salt on the cover. (Cucumbers can be used to make pickles after a week or ten days. In this case you would eliminate further addition of salt, and the cucumbers need not be freshened before making them into pickles.)

If scum forms on the brine, remove it carefully so as not to mix it with the brine. Do NOT stir the brine during fermentation. Curing is complete some time after active fermentation ceases. The white color characteristic of the inside of fresh cucumbers should have changed to the translucent appearance of pickles. The cucumbers will be somewhat clear, dark green, free from whitish spots, firm and crisp in texture.

## READY TO BE FRESHENED

Now they are ready to be freshened and made into pickles. To freshen the cured cucumbers, drain off the brine and cover them with fresh lukewarm water; soak for 12 hours or longer, changing the water 2 or 3 times. Keep as near lukewarm as possible for the entire time. This should remove the salty taste. When the cucumbers are freshened, use them to make your pickles.

(Cucumbers which have been cured for several weeks may be stored and made into pickles later. To store them, pack in clean glass jars, cover with brine and seal. Or you may skim the brine carefully, cover the surface of the brine with mineral oil, cover and set in a cool place. If sealed from the air and kept cool, the cured cucumbers will keep for several months, and may be freshened and made into pickles at your convenience.)

## SOUR PICKLES

- 4 quarts cucumbers
- $\frac{1}{2}$  cup salt
- 2 quarts water
- 1 quart vinegar
- $\frac{1}{2}$  cup sugar
- $1\frac{1}{2}$  teaspoons celery seed
- $1\frac{1}{2}$  teaspoons whole cloves
- $1\frac{1}{2}$  teaspoons peppercorns
- $1\frac{1}{2}$  teaspoons mustard seed

If cured cucumbers are used, freshen the cucumbers. Drain.

If fresh cucumbers are used, wash them and place in a brine made of  $\frac{1}{2}$  cup salt and 4 quarts water and leave for 12 hours. Rinse well with fresh cold water and drain.

Mix the vinegar and sugar. Add the spices tied loosely in a piece of cheesecloth. Heat the mixture to boiling and boil for 5 minutes. Remove the spices.

Pack the cucumbers into hot sterilized jars and fill the jars with the boiling sirup. Seal. Yield: 4 quarts.

## KOSHER DILL PICKLES

- 2 dozen 4-inch cucumbers
- 1 quart vinegar
- 1 cup salt
- 3 quarts water
- For each quart:
- 2 heads dill
- $\frac{1}{4}$  teaspoon powdered alum
- 1 clove garlic
- 1 small, hot red pepper

Wash fresh cucumbers and let stand in cold water overnight. Drain. (If

cured cucumbers are used, freshen the cucumbers and drain.)

Place one head of dill in the bottom of each quart jar. Pack the cucumbers into the jar; add the amount of alum, garlic and pepper given above to each quart; place a head of dill on top.

Combine the vinegar, salt, and water; heat to boiling; fill each jar and seal. Yield: 4 to 5 quarts.

## THOUSAND ISLAND PICKLES

- 1 quart fresh cucumbers, sliced
- 1 large onion, sliced
- $\frac{1}{4}$  cup salt
- 6 cups water
- 1 pint vinegar
- 1 tablespoon white mustard seed
- $\frac{3}{4}$  cup sugar
- 1 green pepper, sliced
- 1 red pepper, sliced
- 1 cup celery, sliced
- $\frac{1}{2}$  teaspoon tumeric

Combine the cucumbers, onions, salt and water and let stand for 2 hours. Drain. Heat the vinegar, mustard seed and sugar to the boiling point. Add the vegetables and tumeric. Simmer

Place the cucumbers in a clean crock and cover with a pickling sirup. To make the sirup: Boil the vinegar, 1 cup of sugar and the spices tied in a bag for 5 minutes. Remove the bag and pour the sirup over the cucumbers. (The mustard and celery seed may be packed with the pickles, if desired; they do not darken the pickles as do the other spices.)

For two successive days drain off the sirup into a kettle, add 1 more cup of sugar, and heat to a boil. Pour hot over the pickles.

On the third day drain the pickles and pack them into hot, sterilized jars. Fill the jars with the boiling sirup, making sure all the cucumbers are completely covered. Seal. Yield: 4 pints.

## PICKLED BEETS

- 4 quarts small beets, OR sliced or quartered larger beets
- 2 cups sugar
- 1 stick cinnamon
- 1 tablespoon whole allspice
- $3\frac{1}{2}$  cups vinegar
- $1\frac{1}{2}$  cups water

Cook and peel beets. Combine the

Cured cucumbers may be stored in glass jars for several months and made into pickles at any convenient time. Very large cucumbers are suitable only for sliced or chunk pickles — or better still in your fresh salads!

for 5 minutes. Pack into clean hot jars and seal. Yield: 3 pints.

This makes a crisp pickle similar to Bread and Butter pickles. Cucumbers alone may be used (2 quarts) if desired.

## SWEET GHERKINS

- 2 quarts small green cucumbers
- $\frac{1}{2}$  cup salt
- 2 quarts water
- 1 quart vinegar
- 3 cups sugar
- 2 tablespoons whole allspice
- 1 tablespoon celery seed
- 2 tablespoons stick cinnamon
- 2 tablespoons whole cloves
- $\frac{1}{2}$  cup white mustard seed

The cucumbers should be of uniform size, 1 to 2 inches. Freshen cured cucumbers; OR wash the fresh ones, place in a crock, cover with a brine made with the salt and water, let stand 24 hours and drain.

sugar, spices, vinegar and water in a large kettle, add the beets, and simmer 15 minutes. Pack the beets into clean hot jars, cover with boiling hot sirup and seal. Yield: 6 pints.

## PICKLED PEACHES

- 20 to 24 small peaches (about 4 pounds)
- 4 cups sugar
- 2 cups vinegar
- 4 long pieces stick cinnamon
- 1 tablespoon whole cloves

Skin the peaches, but do not remove stones. Make a sirup of the sugar, vinegar and spices tied loosely in a bag; boil 5 minutes. Place the peaches in the sirup, and cook until tender and somewhat clear. Pack into clean hot jars; cover with boiling sirup and seal. Yield: 4 pints.

Pears may be pickled the same way.

# Help for Your Furniture

WE'RE talking about those disfiguring white rings or spots left by wet tumblers or spilled water on tabletops or other wood surfaces. These, and even cigarette burns, can be corrected with a little know-how and elbow grease, say specialists at the New York State College of Home Economics.

The white rings can sometimes be washed off if tackled at once, but if they prove stubborn the specialists advise rubbing with one of the following:

1. Powdered pumice or any fine-grained cleaning powder and machine or salad oil.
2. Salt and mineral, salad, or machine oil. Since the salt is needed for friction, do not mix it with the oil, as the salt would dissolve. Instead, dip the thumb or index finger in the oil and then in the salt and rub the spot well. Fine steel wool lubricated with oil may be necessary if the spot is old or deep.
3. Camphorated oil or oil of pepper-

Unsightly white rings on wood surfaces can be made to disappear in a twinkling by following the directions given here by Cornell specialists.

mint, either alone or with salt, pumice or cleaning powder. When the ring has disappeared, wipe the spot dry and rub the whole surface with furniture polish or wax. Cigarette burns are more tricky to treat, but can be improved, say the Cornell specialists. First rub off the

charred places with fine steel wool, but be careful not to scratch the surround-surface. An orange stick with steel wool wrapped around it makes a handy tool for this purpose. If the burn is deep, fill the spot with a paste of pumice and varnish or commercial water putty and water after the char has been removed. Smooth off the edges. Let the paste harden and rub it carefully with fine steel wool or garnet paper. Then paint the spot with oil paint and varnish mixed to match the finish of the wood surface. A drop or two of Japan drier will speed the drying. Smooth out the edges lightly with a finger. Add a second coat, if necessary, and rub the whole surface with furniture polish.

## ONE-ACT PLAYS AT STATE FAIR

FROM Sept. 3 to 7, inclusive, fairgoers to the New York State Fair will have a chance to see good one-act plays put on by their neighbors. Ten rural and city groups are cooperating with the State Fair Theater, and there will be four performances on each of the five days, beginning at 5 p.m. Admission to the theater, which is located in the auditorium of the Women's Building, is free. Last year, every performance was packed. Fairgoers found that the theater provided first-class entertainment, not to mention a chance to rest one's tired feet. Cooperating groups are: East Clay Grange; Westford Home Bureau; Excelsior Theater of Navarino; Utica College Gaslighters; Ilion Little Theater Club; Children's Theater of Cortland State College; Fredonia State College Mimmers Club; Liverpool Theater Guild; Community Theater of Syracuse, and General Electric's Park Players.

## GAY CHINTZ APRON

In a few spare moments at the sewing machine you can whip up this gay chintz apron No. E-158. Nice to wear yourself or to give to somebody. Enclose three cents in coin with your request for instruction sheet, and address Needlework Dept., AMERICAN AGRICULTURIST, 10 North Cherry Street, Poughkeepsie, New York. Please write name and address plainly.

## Casual Clothes

No. 2231. An action back adds extra ease to this cotton casual. Other points of interest are trim tab yokes and twin pockets. Sizes 12-20, 36-48. Size 18, 4 3/4 yds. 35-in. fabric, with 2 yds. ric rac trim.

No. 3085. Classroom casual with yoke-panel—perfect lines for cotton or clan plaid wool with white collar and cuffs. Long sleeves, too. Sizes 6-14. Size 8, 1 3/4 yds. 54-in., 3/8 yd. 35-in. contrast.

No. 2197. There's added appeal in this sew-easy coverall apron: Slimming midriff, flower pot pocket! Sizes small, medium, large, extra large. Medium,

2 3/4 yds. 35-in., 9 yds. ric rac. Applique included.

No. 3506. Make this smart tailored skirt with large saddle pockets or fake-pocket flaps! Waist sizes 24-34. Size 28, with flaps, 1 1/2 yds. 54-in. With pockets, 2 1/2 yds. 35-in.

TO ORDER: Write name, address, pattern size and number clearly. Enclose 25 cents for each pattern wanted. Add 25 cents for our Fall-Winter Fashion Book which has attractive pattern designs for all ages, sizes and occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

## WHAT'S GONE BEFORE

The day after his marriage to Ann Clinton, Mark Wilson leaves to join Lincoln's volunteers. His brother, Charlie, and his father, George Wilson, follow him into the Army; also Ann's father, Fred Clinton. News comes of Mark's death in the Battle of Fredericksburg, and in her grief Ann becomes indifferent to everything, and marries Henry Bain in order to hold the farm for her mother's sake.

## CHAPTER XXV

GENERAL Grant, suiting action to words, moved on Lee and attacked him while he was entrenched in the tangled forests of the Wilderness in May of 1864. Early on the bright morning of May 6, Charlie Wilson's cavalry troop rode up to test and probe the Confederate lines, and then, having met more than they had bargained for rode back again through the infantry lines, while the boys on foot yelled and shouted curses at the cavalry for again "starting something you can't finish!"

As he listened to the foot soldiers' particularly bitter tirade this time, Charlie wondered if the hatred among the different Union services was not even worse than that between the Union forces and the Confederates. Then, because he was essentially fair-minded, he concluded that maybe if he were slogging along on foot, knowing nothing of the facts and seeing the cavalry constantly retreating after its advances, he might feel exactly the same way as the infantrymen did.

What the foot soldiers didn't know, or would not admit, was that one of the duties of the cavalry was to do just what they had been doing that morning—try out the Confederate lines and forces so that the officers could know just what was the situation ahead. Usually vastly outnumbered, the cavalry were not expected to stand and fight, although there was plenty of evidence of the glorious record of the cavalry where a stand was needed, and of hand-to-hand saber duels. Often its losses outnumbered those of the infantry.

During those early May days, Charlie had reason to revise his belief that he had seen the ultimate in horror in the fighting at Gettysburg the year before. There the dead had lain so thick on the ground that it was difficult for either man or horse not to step on them. And then had come the cloudburst on the last day of the fighting, flooding Rock Creek and washing away and drowning many of the wounded. But in this murky Wilderness, the wounded weren't drowned; they were burned to death. Soon after the fighting started, the woods were filled with powder smoke, lighted by constant flashes of guns. Out of the murk there frequently came grey lines of Confederate troops, screeching the bloodcurdling, high pitched, nasal yells which they always used in a charge. Fires soon started in the dead limbs and the leaves that littered the ground, adding to the smoke, and time again and again Charlie heard the desperate cries of the wounded as the creeping ground fires reached them.

On one of those hideous Wilderness days when the cavalry were acting as a reserve for the infantry, an officer suddenly shouted "Count Fours!" Down

the line came the short, staccato count: "One-Two-Three-Four!" "One-Two-Three-Four!" And then the order: "Dismount! Every Number 4 man hold the horses; the others prepare to go forward."

Charlie was disgusted to find that he was a fourth man, for he had no desire to hold horses while his comrades went forward into the fighting. Knowing that Sergeant Miller was ill that day and that he had had difficulty staying in the saddle, Charlie proposed to him that he take his place.

"You hold the horses, Hank," he said. "I don't want to stay here, and you aren't fit to go forward."

It didn't take much urging, for Miller knew that he was really incapable of doing much fighting. So he remained behind, but later in the day when the troops came back to where they had left their horses, the horses were gone. So were the men. A troop of Rebel cavalry had come around the flanks of the Federals, captured the horses and made prisoners of the men who were holding them.

Realizing that had he taken the apparently easier and safer job of staying behind with the horses, he would now be a prisoner of war, Charlie Wilson thought once again of how lucky he had been. So far, in all the battles and skirmishes, he had come through without a scratch, while almost every week new faces filled up the ranks of those who rode with him. How long could his luck hold? A long time afterwards, when the war was over, he

learned that his friend and comrade, Hank Miller, who had ridden the weary miles of the marches with him and stood with him so many times in the heat of battle, had died in Andersonville Prison.

Defeated in the battles of the Wilderness on the 6th and 7th of May, the indomitable Grant moved in again on May 9th and 10 against the Confederates at Spottsylvania Court House and at Cold Harbor. Again he was defeated. In a visit with his father after these fights, Charlie learned that the Federals had lost seven thousand men in one desperate charge at Cold Harbor, and that after six weeks of fighting in the Wilderness country, from May 5 to June 15, 1864, Grant lost 55,000 men, or almost as many as Lee's entire forces in the field. When these terrific losses were reported back to the northern homes from which the boys came, sadness hung like a gray pall over the North. Even with these hideous losses, Grant "the butcher" as he came to be called, seemed to be making no more progress toward the Confederate capital than had his predecessors.

But after each defeat, the short, stubby man in his unpressed uniform gritted his teeth on the cigar that was always in his mouth and moved in again, hanging on like a bulldog even when he was licked, and gradually wearing down Lee's resistance. Finally, unable to make much headway from the North toward Richmond, Grant swung his forces around to Petersburg, bordering Richmond on the south, knowing that if he could capture Petersburg, Richmond would have to fall. Here for weeks the Union forces made little progress. Someone conceived the idea of digging a great underground tunnel under the Confederate forts that defended Petersburg and laying a powder mine in the tunnel. When all was ready, the powder was exploded, causing the tunnel to erupt like a volcano. Into the crater rushed the Union forces, hoping to take Richmond. Instead, they were caught in a death trap in which thousands of them were killed or taken prisoner. Grant had failed again.

Of the early part of the Petersburg siege Charlie Wilson saw very little.

During the summer of 1864 Lee sent his great cavalryman, Early, with 20,000 men on a raid through the rich Shenandoah Valley for supplies, and possibly to capture Washington. Foreseeing this move, Grant had kept back enough forces to protect the city of Washington, but out of the Shenandoah Valley, most productive farm valley in America, Early brought back thousands of horses, cattle and other supplies to feed the Confederate Army. That this might not happen again, Grant sent General Philip Sheridan to destroy everything in the Valley, and Charlie was one of the 26,000 men who rode with Sheridan, Merritt, and Custer into the Valley.

As a farm boy, it distressed Charlie to see a great farm country laid waste. Sheridan rode the length of the Valley, up and down again, and slaughtered or drove off thousands of cattle and sheep, burned more than 70 grist mills, and destroyed over 2,000 barns filled with hay and grain. When he was through it was said that a crow couldn't fly over the Valley unless he carried his provisions with him.

But Sheridan didn't get away from his raid unscathed. When Lee learned what was up, Early was ordered to return to the Valley and drive out the destructive Union cavalrymen. Early in the morning of October 19, 1864, Charlie was eating breakfast with his messmates around a little breakfast fire. Of late the rations both for men and horses had been especially good because they were living off the rich country. It was a foggy morning, and not dreaming that the enemy was anywhere near, the men were happy and relaxed, and there was joking and laughter as they ate. Suddenly out of the fog came the screaming yip, yip, yip of the Confederates, and the gray coats were upon them. But though surprised, the discipline and experience of the veterans helped them to rally, mount their horses, and get away, with the Confederates in hot pursuit. Gradually the Federals began to slow up and to turn and fire at their pursuers from their saddles.

When the fighting began, Sheridan was at the village of Winchester, twenty miles away, where he had stopped overnight from a trip to confer with Washington officials. Hearing the firing, he hastily mounted his famous black horse, Rienzi, and rode the twenty miles to the battle at a gallop. His presence and leadership helped, but by the time he arrived, the Federal cavalry had already turned on their pursuers, and the situation had become reversed.

While the fighting was going on, Charlie saw Custer "the Dandy," whose uniform and accoutrements were always bright and shining, stand up in his stirrups at the edge of Cedar Creek, his long hair waving in the breeze and saber in air as he led his forces into and across the creek in pursuit of the now rapidly retreating Confederates. Back through the disordered and littered camp which the Federals had left so hastily in the morning, they now drove the Southerners, winning the battle and thoroughly discouraging Early from attempting to stop Sheridan's ruthless destruction of the Rebel Army's food supplies in the Valley.

Thinking about the fight in his blankets that night, Charlie's thoughts were mostly of Rienzi, the General's fine horse. When Sheridan had come pounding in at Cedar Creek that morning, he had pulled up the foam-covered charger within a few feet of Charlie's company waved his hat in the air and yelled to rally the men. "What a horse!" thought Charlie as he lay remembering the thrill he had felt on seeing the magnificent animal in the heat of battle.

During the summer of '64, Sherman, (Continued on Opposite Page)

## SLIM &amp; SPUD

## Spud Gets Down to Eatin' Again

**M**Y BREAKFAST dishes are done, the beds are made, the floors are dusted, the hole in my husband's shirt is mended—and all this was accomplished while the washing was being done in our upstairs bathroom in an automatic washer.

It may seem odd to use an upstairs bathroom for a laundry, but it certainly is convenient. Before we got our automatic washer, I used to wash in the kitchen, after dragging in the washer from the storeroom. Then I had to bring all the soiled clothes, sheets, pillowcases, towels, etc., downstairs, wash them, hang them on the line, summer and winter; iron them, and carry them all upstairs again.

### Grandma Had it Harder

Of course, that washday procedure was nothing compared to my grandmother's. At five in the morning, she arose and built up a roaring fire in the highly polished black stove. She pulled the boiler of clothes that had been soaked overnight onto the two front grids, and I was awakened by the pungent odor of boiling yellow soap which permeated the entire house. I knew I must keep out of her way that day, even though she loved to have me visit her.

With a big hand-whittled stick, Grandmother stirred the clothes at intervals. After an hour or so of rapid boiling, she dipped each piece into a waiting tub filled with water that had been pumped and carried by the pailful into the house. The boiler was filled again with clothes that had been soaked, and she proceeded to scrub the first boilerful on a metal washboard. She rung them all out by hand, until she received a wringer one Christmas (when no doubt she felt more emancipated than I do with my automatic washer).

The clothes were then rinsed twice, blued, and starched to a fare-you-well

# I've Gone Upstairs with My Laundry!

By HAZEL W. COSLINE

—everything except Gramp's night-shirts. The wash was hung on a long clothesline between the house and barn, and I helped, when visiting Grandmother, by handing the clothespins to her. By the time she fell into bed that night, just after dark, every piece had been sprinkled "good and wet" and rolled tightly. The next day she arose at dawn, built up a roaring fire again, and heated her irons. After breakfast, she ironed until noon, hoping to finish then. Usually she shook out what she couldn't finish and did them the following day.

The next generation felt themselves somewhat emancipated by taking their wash to the basement where there was running water and good harmless bleaches, making boiling unnecessary. And now I have gone upstairs with my washing, and my ironing, too. Besides the automatic washer in our bathroom, there's room for a mangle (which doubles for a dressingtable), and a linen closet, so now the towels and washcloths never leave the bathroom.

I keep soiled clothes in a clothes hamper in the linen closet in the bathroom, sort them on the spot, put them in the washer (which washes and almost dries everything enough to iron), and finish drying them on portable bars in the bathroom. Towels and washcloths are folded and put away in the linen closet in the bathroom, and other things that do not need ironing (such as undies and pajamas) are folded and put in bedroom chests and closets. No more carrying soiled clothes downstairs and clean clothes back upstairs!

I wash twice a week—the things that need ironing one day, and the things that do not need ironing on another convenient day. Nearly all of the ironing is done on the mangle—everything except dresses. I even manage to do ruffled curtains on the mangle. As for the sheets, they are dried outdoors on the line in summer, and on the clothes bars, over a register, in the winter.

Another thing which has made all the difference in the world to me on wash

day is the use of a cup of water softener in my washer, along with the detergent I use. I saw a marvelous demonstration at last year's Cornell Farm and Home Week of the difference a water softener makes in a wash, and now I use it always and get a different looking wash.

(Editor's Note: If you have an automatic washer, we would like to hear from you. Do you like it as well as you thought you would when you bought it? Does it have any disadvantages, as far as you are concerned? For example, is your water supply adequate for it? If it needs repairs or new parts, do you find it easy to get service from your dealer or the manufacturer? Write to Mrs. Mabel Hebel, Home Editor, AMERICAN AGRICULTURIST, Box 367, Ithaca, N. Y.)

The Coslines' 9-foot square upstairs bathroom easily accommodates both the washer shown in the picture and a mangle (not shown), making a very convenient laundry unit. Washer's top opening enables it to fit into an otherwise tight corner.

## NO DRUMS

(Continued from Opposite Page)

acting under Grant's orders, began his part of a gigantic squeeze with his march into Georgia and then northward, catching the Confederates between the Union Army in the West and the Army of the Potomac. On May 4, the same day on which Grant advanced into the Wilderness, Sherman moved against Joseph E. Jackson, who was entrenched in the hills of Dalton, Georgia, with an army of 100,000 men, and then, in a series of battles, laying waste the country as he advanced, on September 1 Sherman finally took Atlanta, the great manufacturing center of the South. From there Sherman began his march to the East and then northward, finally joining Grant at Richmond early in 1865.

To Nancy at home it often seemed that peace would never come. It had been so long now since those distant happy days before the war that they were almost like a dream, and she sometimes lost hope that they would return again. The abnormal had become the normal.

"Maybe", she thought, "I'm getting some of the same lack of the capacity to feel, the same indifferent attitude that Ann has had."

During the awful Wilderness campaign, when the newspapers were filled with the news of Grant's repeated defeats and with the long lists of the war dead and the missing, Nancy would scan the lists feverishly, and when no one else was likely to bring the mail, she trudged down the road to the post office herself, always hoping for a letter from George or Charlie assuring her of their safety. It was like living on a keg of dynamite that might explode at any moment, destroying all possibility of happiness.

With the help of Tom and Enoch Payne and the little money that George managed to send home now and then, Nancy was able to get along and find enough for them to eat, such as it was, and clothes for them to wear. Nancy was thankful for the responsibilities of taking care of the family. The immediate problems of the day helped her to forget her worries, and the hard work tired her out so that she could sleep. It was good, too, to have Ann dropping in to see her. The girl seemed to be getting on better. Though she no longer discussed her personal problems with Nancy, Nancy knew that her distrust of her husband was growing less because of Bain's apparent change of attitude toward the war.

When Nancy spoke to Enoch about this, he laughed cynically and said:

"Don't give Hank too much credit. I think he's quit his Copperhead activities only because he had to. That warning he got and the fire were just what he needed. Moreover, he's making plenty of money now because of the high war prices for the stuff he sells. He knows the Johnnies are going to be licked, and so he's climbed on the bandwagon of the winning side."

Nancy said no more, but she was glad for Ann's sake that whatever Bain's reasons were for changing, his attitude made things pleasanter for his wife.

Ann did frequently speak of her father, and George had mentioned Fred Clinton several times in his letters. According to reports, Fred was a good soldier and, strange to say, in spite of the hardships of Army life and the general drinking, Fred seemed to have reformed on that score. George and he had had several visits, and George wrote to Nancy that the man really had a lot of character and was a good fellow. What probably had ailed him at

home was that he was not a good farmer, and the constant worry and irritation of trying to make a living for himself and his family on a poor farm had gotten him down.

Then one day following the Battle of Cold Harbor, Ann, white-faced and shaking, came in to Nancy's kitchen and held out a message for her to read. Before she took it from the girl's trembling hand, Nancy guessed what it contained, and she was right. It was the customary brief notice, addressed to Mrs. Clinton, that Fred Clinton had been killed in action.

Ann sank into a chair, and Nancy stood looking at her, wondering what she could say. What was there to say? She knew that Ann had gone through just about all that she could stand, but even in her sympathy for Ann, Nancy couldn't help thinking that maybe it was for the best. Fred Clinton had redeemed himself as a soldier

and as a man, and, after all, what did he have to come back to? Henry Bain had his farm, and there was little prospect of happiness for him in the kind of life that he would have had if he had come back. \* \* \*

The year came to an end at last, and the folks at home ate their hearts out while they watched, worried and waited. One day Mary Payne put Nancy's own thoughts into words when she said:

"Did you ever think, Nancy, about all the costs and casualties of war beyond the actual dollars and cents cost and the loss of the dead and the wounded?"

"I think I know what you mean, Mary," Nancy replied. "For one thing, it will take years to get over the hard, bitter feelings between former friends and neighbors right here in our own county, to say nothing about the hatreds that will last a long, long time between the North and South."

"Yes," Mary agreed, "that's a bad part of it, and I know from what little history I have read how war always affects people's morals. It seems to increase extravagance, waste, fraud, and dirty politics."

"Yes," said Nancy, "and also war robs us women of our youth as well as of our husbands and sons. I was a comparatively young woman when this war started. At least I thought of myself as young, even though Mark had grown up. But now I certainly am old. Only a wife or mother can ever know the price women pay for war."

"I know," said Mary. "There are no drums for us on the home front, but maybe it's God's way of getting good things done. Maybe it's worth all the cost to us here and to the soldiers to free the negroes and to save the Union, but I do wish it could be done some other way."

(To be continued)

### COURAGE

By Eleanor Alletta Chaffee

I said to myself, I'll take my grief  
Into the fields, and there, alone,  
It may turn light as a fallen leaf,  
Or be anonymous as a stone.

But a tree torn by the lightning's blade,  
Wrinkled with wisdom, gnarled by age,  
An elbow across the old wall laid  
And regarded me like a sage.

I saw the scars on the bitten bark;  
I heard its courage sing  
Out from its green heart as the lark  
Lifted on perilous wing.

I said to myself, I'll keep my grief;  
Not as a pain, a scar,  
But worn as proudly as conquerors  
Wear a victorious star.

# KERNELS, SCREENINGS and CHAFF

## SUNNYGABLES NOTES

John B. Babcock

**I**F THE degree of controls is reduced over the following months and inflation results from the remaining controls and other contributing factors, farmers and their "selfish interests" are sure to get their share of blame for this most feared economic state. The charge will be made that more stringent controls, such as have been recommended by the Administration, would have prevented the predicament. The important thing to farmers is that the burden of blame will be borne by the farmer. Too many voices will be raised against him.

Farmers are aware of the increasing lack of understanding of farm problems by non-farm people, who blame them for high prices, lack of national unity and failure to recognize the problems of the consumer. We must go beyond our own circles to those urban people who are not sympathetic with farm problems because they are not well informed. The next time you hear an unjust or inaccurate statement about the farmer's position in politics or economics, don't rush to your next door neighbor with your protest—tell the right story to your city neighbor. Like any American, he'll be fair, if he knows the facts.

### PRESSURE OF CUSTOM WORK

No one ever got a more thorough cussing at home than the fellow hired to do custom work who failed to show up when he promised and was most needed. The reason custom work is used on the farm is that the amount of work does not merit investment in a high price machine, or because this machine cannot be afforded at the time. When we hired custom work, we just never could understand why our job was continually put off and off until it was almost too late.

### Boots Knows

Boots Poelvoorde is in the other fellow's shoes now. He is under constant pressure to be a dozen places at one time. In the Ithaca, New York, area, the first time we had a day suitable for combining wheat was July 23. By that time, wheat everywhere was ready to thresh. Humid weather shortened the actual cutting day to 7 or 8 hours. No matter how willing you are, you just can't move through a wheat field when it is tough or the least bit damp.

Boots had a chance to start his own harvest almost on time. As a good machinery operator, he squeezed every bit of production out of the machinery during favorable weather. But he couldn't be more than one place at a time.

Put yourself in this position: you promise to be at a neighbor's farm to combine Thursday morning. It is Tuesday, and you figure you can finish your own work and the few acres promised another neighbor. Then it rains for two days.

No matter how fast you crowd the work, it is two days late when you start. The first neighbor is indignant that you didn't get to his work the moment the field dried off. The second neighbor is madder yet that you are three or four days late at his place. The third fellow you have on the com-

binning schedule is phoning to ask where the dickens you are. Then you hit a 'chuck hole and the machine breaks down. Then it rains again. And on it goes.

If you are the fellow hiring the combine, you are on pins and needles at this point. There's good reason for this feeling, too, with grain shelling out of the heads every day, and the threat of a good rain or windstorm ruining the entire crop. But just think of the man with the custom machine! Being merciful on pins and needles is nothing compared to the way he feels when he cannot fulfill a promise to a good neighbor.

### SECOND CUTTING GRASS

Because we are close to Cornell University and the School of Nutrition, we have been able to check on the nutritive value of our silage and hay. The results have been interesting. What's encouraging is that the feed we think best by appearance, smell, and enthusiasm of the cows, usually proves to be the best. The final test of good feed is the way cows go after it. They have their own mechanical laboratory that some way tells them which feed is best for them.

Our earliest spring forage is orchard grass. This heads out first and is ready for the silo ahead of anything else we have. Because it is cut off early, the aftermath, or second cutting, is ready while many other hay stands are being cut for the first time.

Our second cutting orchard grass does not have as much alfalfa in it as we counted on when the seeding was made in oats. Nevertheless, we cut this grass when it was still young and tender. It had not headed out, but the few legumes in the mixture were blossoming and indicated that it was time to cut.

The yield of orchard grass was not heavy, but I would bet that the quality is as good as any hay we have or will cut. The nutritional experts tell us that young grass has high protein and carotene value—much greater than the same grass after it has matured. As our second cutting grass cured, it lost very little color. Most of this grass was put in long with a long hay blower, and has not heated in the mow at all. Just as you can "feel" that a crop of hay or silage has the "punch" needed to grow youngstock or make milk, we have a hunch that this beautiful second cutting orchard grass will do a lot of good in our dairy. Chemical tests may bear this out, and the response of milk cows and calves to this feed will finally prove the value of young, tender grass.

### THISTLES AND WOODCHUCKS

Although I was never allowed a bicycle as a boy because "they are too dangerous," I had a rifle and a riding horse before I was 12 years old. Dad and the neighbors used to give me ten cents for every woodchuck tail I could produce. I'm sure I was safer stalking woodchucks after a thorough schooling in the correct manner to handle firearms than I would have been weaving down a busy highway on a bike.

From those experiences with my rifle, I learned to respect the confidence placed in me that I would use it correctly, and to accept woodchucks as a

natural enemy. In the fading light of day, I still like to wander over a freshly cut hayfield in search of a brown blurb in the distance that must be a woodchuck. Often they are at the mouths of the same dens at which I have shot literally dozens of these pests over the years.

### Good Pastures Draw Pests

For many years we have noticed that the better pastures draw the most woodchucks. Similarly our best early spring pastures draw deer from the protection of the hills to get their first square meal of the year. Thistles and other weeds also become tremendous in these fertile fields.

To keep a good pasture coming, both woodchucks and thistles must be controlled. Often, the only way to get at the woodchucks is to stalk and shoot them. Some thistles grow in places that can only be reached with a hand scythe before they ripen and spread millions of seeds over the rest of the land.

Perhaps the good pasture owner should carry two tools in his car—a rifle for 'chucks and a scythe for thistles. To me, shooting is a pleasure, but I can't say the same for using a scythe. I notice that the Russians use a sickle as part of their national symbol. For my money, if the Russians claim to be the "first" to invent the scythe, they can have the dubious distinction. I'll take the good old mowing machine.

### FARM TIRES

A tire expert who spends full time checking tire failures in the field tells me that the biggest cause of tires wearing out before their time is under-inflation. This seems to hold true on passenger cars, trucks, and farm implements. A well mechanized farm may have between 40 and 50 tires at work on various machines and vehicles. That

is an investment worth caring for.

There is nothing more aggravating than to check over the mechanical features on a machine to be sure of good working order, and then have a tire blow during an important job. Sometimes the flat tire is due to a nail or a partially buried iron stake or other accident. More often though, a little attention earlier would have prevented the breakdown.

Farm tires are called on to stand all types of operating conditions. Tires on a wagon, for instance, may appear to have plenty of air in them after standing on the barn floor, with no load for a number of weeks. When those same tires reach the field and are subjected to their share of a three or four ton load, one of them may go almost flat. When this is the case, the load usually goes to the barn on the soft tire. I know we have been guilty of this, and have even forgotten to fill the tire before making another trip. The tire seems to work partially flat, and we forget the strain on the sidewalls. The payoff comes when the tire fails, and we are inclined to condemn the tire as faulty rather than our own negligence.

### Tools for Tires

Somewhere in the farm shop there should be a place to repair tires with the proper tools, and to inflate them to the proper pressure. It also pays to have a good hand pump, sparkplug pump, or small compressor right in the tractor at all times. And most important is a good tire gauge, so that trouble can be foreseen.

Just for fun, take a good tire pressure gauge (it'll pay to buy one if you don't own one already) and go over all your farm tires, including the family car and the inside rear tires on the farm truck. I did it the other day and was ashamed of the results.

Here are two pictures of Smitty's last daughters. The older one, at right, which was caught in a nervous pose because heel flies were plaguing her, was sired by a Red Dane Bull. She shows Smitty's slope in her rear quarters, but appears to be dairy cow from one end to the other. She'll freshen this fall.

The second calf, taking lunch at Smitty's liberal cafeteria, is the freak referred to last month. With all of her tail and part of her backbone missing, she still seems to be healthy and hearty. Boots and his neighbor have decided to raise her.

— Photos by C. Hadley Smith

**CRANE, INCORPORATED**, manufacturer of Craine silos at Norwich, New York, is celebrating the golden anniversary of the Craine silo this year. It was in 1901 that the self-contained, self-supported, wood-wrapped TripleWall silo was produced by William Craine, who was then 66.

The company is now headed by his three sons: Zur W., president; Leo D., vice president; and E. Robert, executive vice president. Bruce Craine, son of Zur W., is sales manager and the 3rd generation of the family in the Craine business.

"Broiler Production" is the name of a bulletin available from the GLF Mailing Room, Terrace Hill, Ithaca, N. Y. It contains information obtained from thousands of farm visits as well as some recent research work in the Northeast.

**SHEPPARD DIESELS**, Hanover, Pa., have a 6M Diesel designed especially for Farmall M owners and which can be installed in less than a day. A postal card to Sheppard Diesel, Hanover, Penna., will bring you more information. Tell them you read about it in the American Agriculturist.

The **INTERNATIONAL HARVESTER COMPANY** of 180 N. Michigan Ave., Chicago, Ill., announces that they will subcontract between 80 and 90 per cent of the material required for present government contracts.

This action is the convincing example of the interdependence of big and small industries in the American economy.

The **PHELPS DODGE REFINING CORPORATION**, 40 Wall Street, New York 5, and 230 North Michigan Avenue, Chicago 1, Ill., have four booklets they will be glad to send you. They are called "Bordeaux Mixture," "Bordeaux Controls Late Blight on Tomatoes," "Better Potato Yields," and "Basic Copper Sulfate."

Whether you have a shallow or a deep well, **JACUZZI BROTHERS**, 36 Collier Street, Binghamton, N. Y., have a pump for the job. In fact, the shallow well water system can be changed to deep well by simply changing the injector assembly.

**GMC dealers** have a booklet called "GMC's Tips to Truckers in the Emergency." This booklet gives valuable advice on preventive maintenance for trucks according to a system originated by GMC in 1928 and adopted by the Armed Services in World War II.

A new self-priming centrifugal pump made by the **Barnes Manufacturing Company** of Mansfield, Ohio, for use only with International Farmall tractors. The pump is designed for use in irrigating and spraying crops and other farm pumping jobs.

## Service Bureau

By HUGH COSLINE

### GET YOUR MONEY

Some time ago I shipped some produce to a man with whom I have done business in the past. I have always found him to be thoroughly reliable, but now I cannot get my money or any answer to letters written him.

**ON CHECKING** the above complaint, we discovered that the man in question had died suddenly in the middle of the season and left a number of unpaid accounts. His son writes us that he left no assets and that there is no money to pay outstanding claims.

No matter how reliable a buyer may be, there is always the chance that something like this will happen. If you want to be sure of your money, demand payment before surrendering the goods. This is especially important when selling to a stranger.

We have had a number of cases brought to our attention where a buyer would give a check and then stop payment on it before the farmer could get it cashed. If you want to be absolutely sure of your money, ask for cash on the spot.

— A.A. —

### DUTCH BULBS CO.

Several years ago, a number of complaints came to our attention against Dutch Bulbs Co. of Burbank, Calif., Farmingdale, N. Y., and Long Island City, N. Y. At that time, letters written to them were returned marked "Unknown," and houses that dealt exclusively in bulbs reported that they knew nothing about them.

We are now getting complaints against an outfit by that name which is carrying on a radio advertising campaign. Orders sent to the company in care of the radio station are not being filled. We are making an attempt to check on this concern. If it is the same outfit, we hope to put a stop to their activities along these lines.

— A.A. —

### THANKS!

**I RECEIVED** the \$130 check from you in full settlement of the insurance claim. Thanks! Without your help, I would not have been able to collect as they completely ignored me. I have been a subscriber since 1910, and am enclosing a check so that my subscription can be extended another ten years.

## 8 Exciting Days and Nights • DON'T MISS A THING!

# AMERICAN AGRICULTURIST

FOUNDED 1842

THE FARM PAPER OF THE NORTHEAST

## *We're Going to* **The FAIR!**

**C**HICKENS are being preened, Dad is putting dobbin through his paces, curry combs and polishing rags are busy on dairy and beef animals, Mom is picking out her very best looking jar of pickles, and Sis her finest needlework. They're all going to the fair—a one-day community fair, a county fair or the state fair.

Most enthusiastic of all the exhibitors and most anxious to show up well are the young people in 4-H, Future Farmer and other youth organizations, for it's at the fair that they finally find out how their animals or their

dress or their ability to handle a tractor compares with others'. And if they can beat Dad in open, friendly competition, that's the biggest thrill of all.

Everyone attending fairs—and about eight million will attend them in the Northeast this year—finds much that is interesting and informative, but for the exhibitors, especially the young ones, the fair is a place to learn. They soon find out what it takes in planning and personal attention to raise and show an animal that gets the coveted blue ribbon.

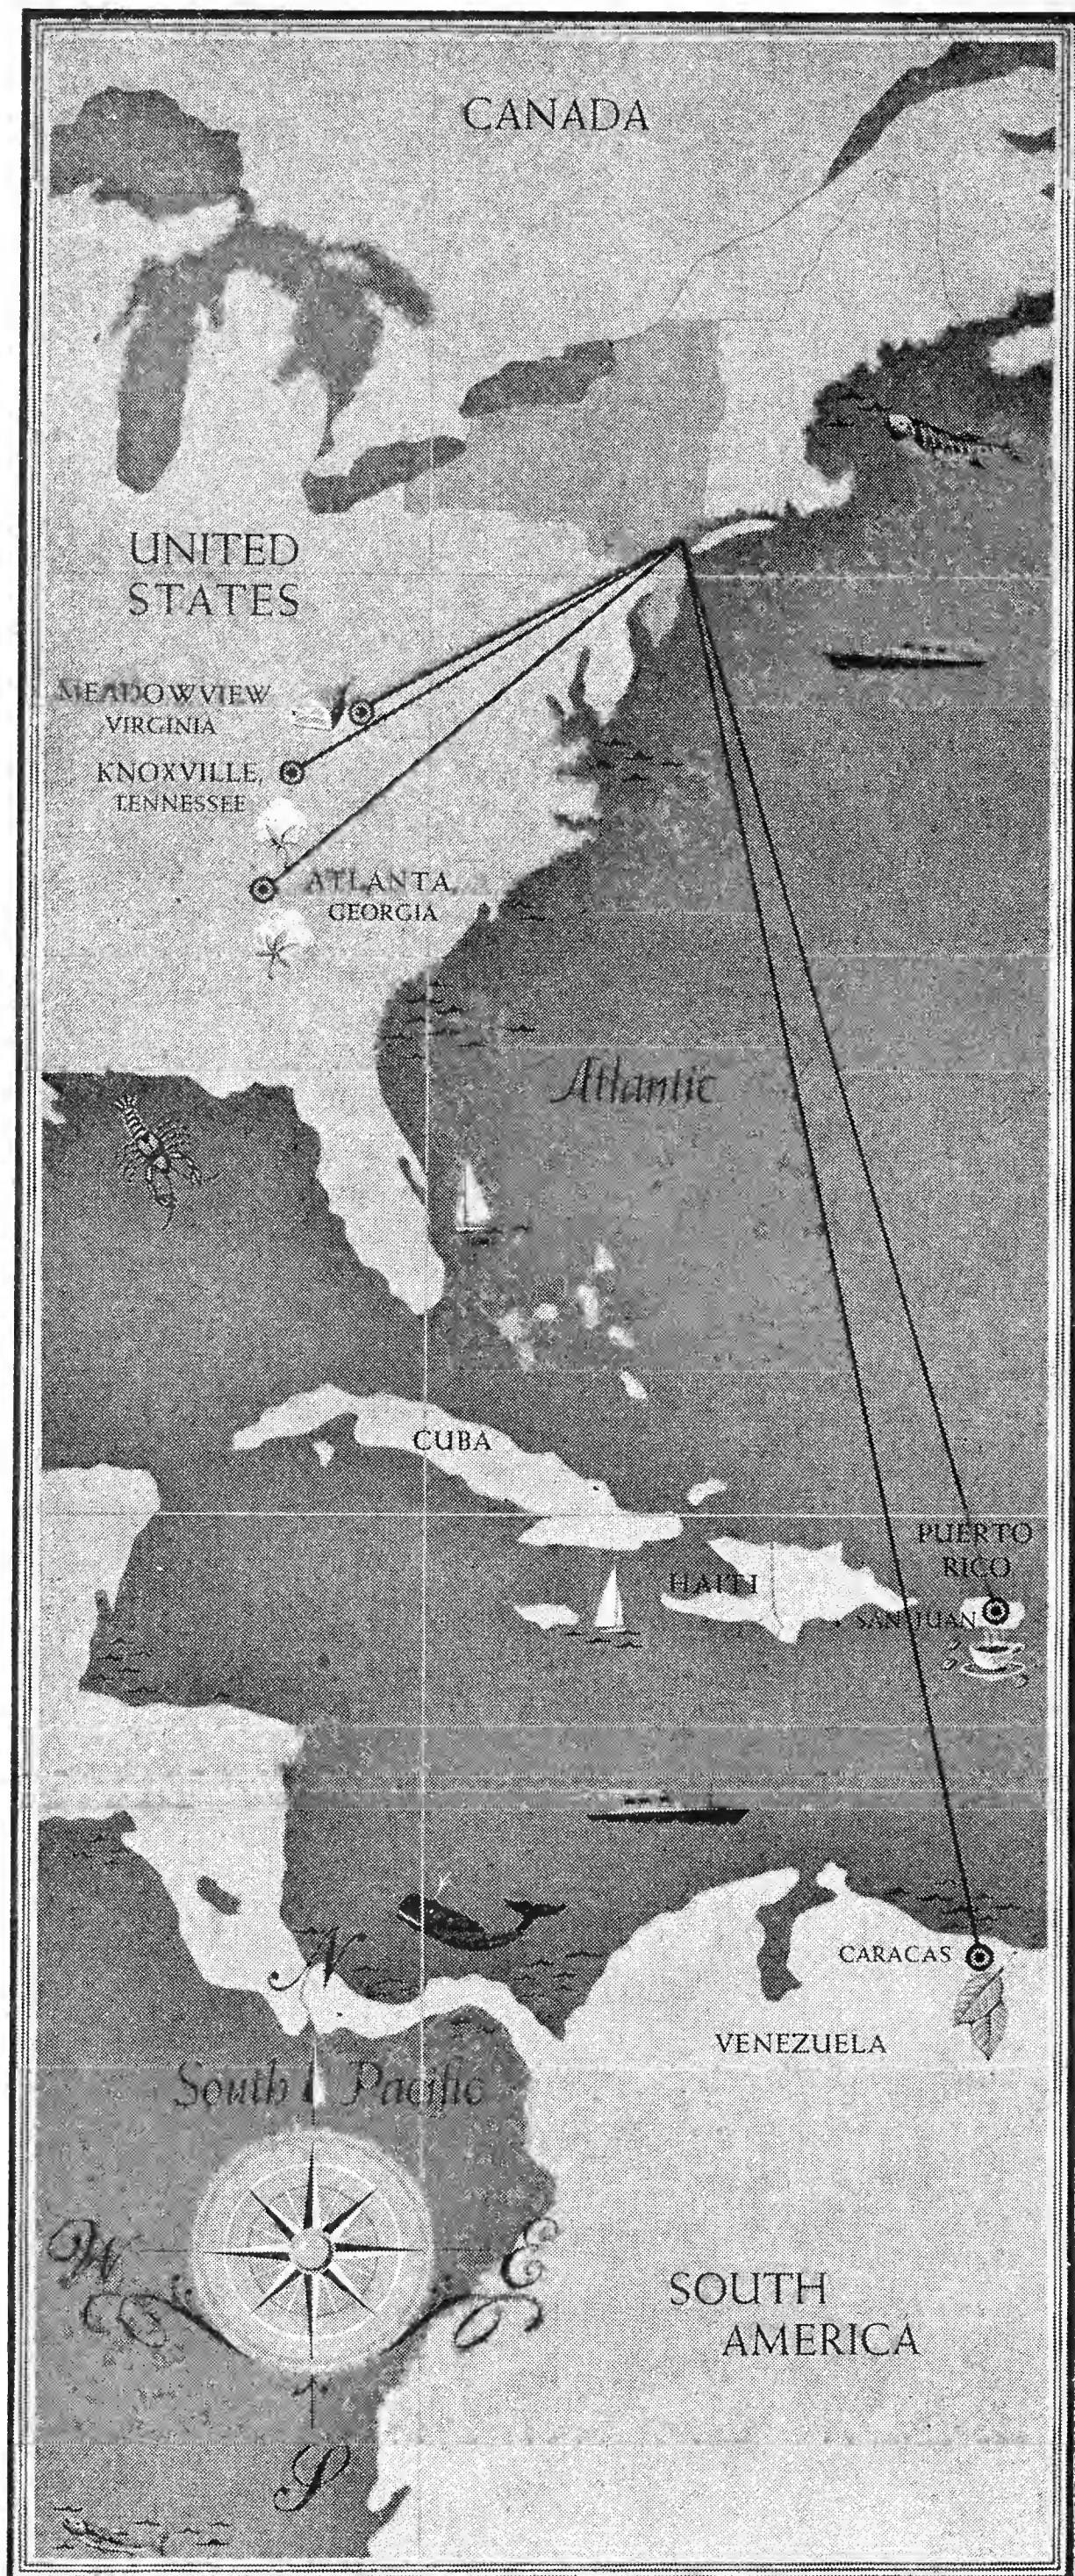

To the winner comes reward and incentive to keep producing top quality. To the loser comes the opportunity to see his exhibit through the expert's eye and a challenge to have his exhibit in top place the next year.

At thousands of commercial exhibits, visitors will see the latest products of industry designed for the farm and the modern home, and besides seeing the best produce, the best animals, the best canned goods and the best needlework, they will be entertained in hundreds of grandstands and along hundreds of midways. For a few hours, the everyday cares and worries will be forgotten and it will do us good.

*So it's heigh-ho, come to the fair*

*The sun's a-shining to welcome the day;  
Heigh-ho, come to the fair!*

# New Markets for your Eggs

ON August 15 last year, large white eggs on the New York market were 53 cents, pullet eggs were 31 cents. Four weeks later large whites had risen to 67, pullets had dropped to 27. Eggs are higher this year, but the same pattern is being followed.

As the new pullets come into production, a great rush of small eggs hits the metropolitan market. People who are accustomed to buying large eggs can't be shifted rapidly to small ones. They bid premium prices for the large eggs while the little eggs go begging.

This is no new problem. It has faced the poultryman every fall for years. Maybe it will never be fully solved. But there are some things that can be done about it and G.L.F. is doing them.

## South to New Markets

First, the most important, is to find some markets where pullet eggs this time of year are more acceptable. G.L.F. has sent men to the southern states and even to South America to search out such markets. Further south they don't have the early hatched birds that we have here; their pullets won't come into production until later. Consequently, in late summer and early fall they have nothing but high priced eggs and are looking for fresh eggs that are reasonable in price. Pullet eggs from G.L.F. territory fill this need.

So G.L.F. is now shipping eggs to a number of southern points such as Meadowview, Virginia; Knoxville, Tennessee; Atlanta, Georgia; San Juan, Puerto Rico; and Caracas, Venezuela.

These new markets are taking thousands of cases of small eggs that formerly went to New York City. Not only do they bring a better price in those localities, but they take some of the pressure off the already flooded metropolitan markets.

## Telling The Story

Another approach to this small egg problem is to educate city people on the value of small eggs. A pullet egg is worth three-quarters as much as a large egg, yet frequently pullet eggs can be bought in grocery stores for less than half. Over station WQXR in New York and the upstate stations of Rural Radio Network, G.L.F. is telling this story to city people.

Through these means G.L.F. is continually trying to develop better markets for your eggs.

# 1 2 3 Extra-Traction Features

## REMEMBER —

Goodyear makes a better tire for every farm job and every type of implement.

**make it your No. 1 buy — and America's No. 1 favorite!**

**N**O other tire gives you SUPER-SURE-GRIP's *three* extra-traction features. No other tire gives you SUPER-SURE-GRIP's extra-long service, so important these days! That's why no other tire can

compare in popularity with SUPER-SURE-GRIP—the *best-liked tractor tire in America*. Get SUPER-SURE-GRIPS at no extra cost and see them pull where other tires won't!

**1. GOODYEAR SURE-GRIP ACTION.** Goodyear lugs are set closer at the shoulder than at the center. This exclusive design provides a vise-like grip that holds the soil in the ground, giving the lugs greater traction than curved lugs that "plow out" the soil. Result — *Goodyears pull where other tires won't!*

**2. STRAIGHT-BAR LUGS.** Because Goodyear lugs are set straight as a ruler, they have greater traction area than lugs that toe in. Result—Goodyear lugs thrust against the soil with equal force from center to shoulder, giving better traction both backwards and forwards — "*the greatest pull on earth!*"

**3. EXTRA-LONG WEAR.** Since Goodyear's SURE-GRIP lug action holds the soil firmly in the ground, skid, slippage and abrasion are greatly reduced. Goodyear's famous O-P-E-N C-E-N-T-E-R self-cleaning lugs have no mud-catching hooks or cups. The result is smoother riding, less slip, *far longer life!*

## A DATE TO KEEP

**B**ACKED by nearly 300 organizations, Elmira, New York, is holding a **Liberty and Constitution Day** on Sunday, September 16. There will be a great parade with several bands. The exercises will be held in the public square with a speech by a nationally and internationally known speaker and with Irving Berlin, the famous songwriter, leading the great crowd in the song which he wrote, "God Bless America." The United States Constitution, with its great Bill of Rights, will be read, with the emphasis of the whole celebration on the need of better support of our Constitution and of the liberties which made this country great. Mark the date on your calendar and go. It will be one of the high, thrilling experiences of your lifetime.

## GARDEN ADVENTURES

"I can't resist telling about my sweet corn experience. On June 2, 1951, I planted Gold Mine sweet corn, and on July 30 our family and son's family had corn on the cob."—J.W.L., Vt.

**T**HAT'S CORN in just 58 days, and it is pretty close to a record for the Vermont latitude, so far as I know. Can you beat it?

Never in my experience have we had a garden producing as much as ours this year, although we have had a constant fight to protect it from vermin. Woodchucks started in on our peas. After we had trapped 12 old and young out of one hole, the chucks were taken care of. Then a kind of blackbird, called grackles, got about half of the rest of our peas. However, I always believe in planting enough of everything to take care of the needs of three families, and to be sure of having enough in spite of vermin and bad weather. So we still had enough peas, but it was a fight to see who was going to get them first, the blackbirds or the Eastmans.

Rabbits have been a bad pest this year and have destroyed some of our garden truck. Our latest problem is an old mother coon, apparently with a young family. She pulls down the sweet corn stalks, eats part of the ear, and makes a bad mess.

We planted several different varieties of sweet corn and had an excellent early variety called Spancross; but every year I am more and more impressed with the uniformity and quality of Golden Cross Bantam. In my book it can't be beaten.

## A GREAT LEGUME

**S**OME farmers have had failures in getting started with birdsfoot trefoil, but these adverse experiences are far outweighed by those of hundreds of other farmers who are enthusiastic over this truly wonderful legume, both for pasture and meadow. It would be very helpful to have letters from you who have had success with birdsfoot trefoil, telling how you did it. We will pass these letters on to our readers. To anyone requesting it, we will send, by mail, concise information on the advantages of trefoil and how to get started with it.

## CHORE TIME IS JUST AHEAD

**F**ARM help, either full or part time, is harder and harder to get, and farmers are answering the problem with more and more equipment. Hundreds of dairymen are installing gutter cleaners. What a lot of backache they save! A lesser number of farmers are using silo unloaders. Some are starting to use pipelines in conventional stables, as well as in pen stables, for transporting the milk from the cow in the stable to the milk house. Many dairymen are waiting to install pen stables as a means of saving labor, as well as for their other advantages. Board of Health regulations will be forthcoming before long so that milk from pen stables can soon be approved by health authorities.

A visit to several dairy barns recently impressed me all over again with the fact that thousands of farmers could save steps and labor by a little study

*By E. R. Eastman*

and some minor expense and work in rearranging the stables to cut down the work at chore time. Many are still carrying both hay and silage farther than necessary. Last winter I was in two barns where the farmers made a trip between the feed bin and the mangers for nearly every cow. On the other hand, I saw one barn (and there are many others, of course) where feed was let down through chutes from the bins above, eliminating steps and much of the heavy lifting.

Fall and winter chore time will soon be on us. Think over the jobs you have to do to see if there aren't some ways of making them shorter and easier and of cutting down on the steps you have to take.

## BEST PLACE FOR BOYS AND GIRLS

**W**E HAVE had a great time on our farm this summer because our 8½-year-old grandson, Dickie, has spent the summer with us.

I have been impressed all over again with the value of farm life and work for a boy or girl, and Dickie himself will never forget this summer nor the knowledge he has gained of how things are done on the farm and in the garden. His love of beauty, taught him by his mother and his teachers, has been increased by the flowers, all other manner of growing things, the clouds and the beautiful sunsets. It has been said many times, and it is worth saying again, that the farm is the best place in the world to bring up children.

I should add also that the best way for us grown-ups to keep young is to have the opportunity to live with the energy and enthusiasm of fun-loving, high-spirited, lovable boys like Dickie.

## HAS WOMAN SUFFRAGE FAILED?

**I**N THE last issue, I said that I had worked hard for woman suffrage, but have seen no improvement in government since women got the right to vote. In fact, conditions in this country and the world are much worse than they were before women voted!

I expected to get my ears pinned back by hundreds of women, but so far I haven't heard from very many, so it must be they agree with me. On the other hand, I am hearing from the men. One man wrote:

"A cousin, an ardent suffragist, visited us after women had been voting for some time. I asked her if she felt any better now than she did before she had the vote. She replied: 'Well, I can't say that I do', but really she must have felt worse as she shortly left this life by her own hand: My wife hates to vote, but I tell her she must to offset the bad voters."

Another man wrote: All that woman suffrage has done is to add greatly to the cost of holding the elections."

I certainly am not advocating taking suffrage from women. I am trying to stir them up to do more than they apparently are doing to get clean and efficient government and to save our liberties.

## GOING TO THE FAIR

**W**HEN I was a kid back in the horse and buggy days, "fun on the farm" was surely limited. There were no automobiles, movies, radios, or television. Absent also was something to use for money.

I never saw but one or two circuses before I was 18, but I did go to the fair. How I looked forward to it! How impatiently we watched the early fairgoers go past our place, raising a cloud of dust on the country road like the smoke of battle. At last we ourselves were on the fairgrounds, our hearts thumping in anticipation as we listened to the merry-go-round organ playing "In the Good Old

Summertime," or watched the band proudly marching up the race track to take its place in the bandstand.

Well, times have certainly changed, but a good fair still brings just as much joy and happiness as it ever did, providing you go in the right spirit. I don't care for the man or woman who goes through life with an attitude of "Try and make me laugh," or "If you've seen it once, that's enough."

The New York State Fair is a great educational institution. It is just as up-to-date in its exhibits as today. No one can look at those exhibits of flowers, vegetables, fruits, field crops, poultry, and animals without being proud of the farms and farmers of this great Northeast. No one can look at all the farm equipment without being amazed all over again at the mechanical progress we have made. No one can study the exhibits of the farm young people and the enthusiastic faces of the exhibitors without the feeling that the agriculture of the future is secure.

Best of all, you can have just as good a time at the Fair today as you old-timers used to in the horse and buggy days, for here, in addition to all the interesting exhibits and all the fun, is the opportunity to shake hands and visit with friends that perhaps you have not seen since last fair time.

## LONG DISTANCE TELEPHONE BY RADIO

**A**S A BOY I was always fascinated to read about the Pony Express, which was started in 1860 to carry the mail from St. Joseph, Missouri, across the plains and the mountains to the Pacific coast. The horses were the swiftest and hardiest that could be secured; the men the most courageous. Relays of horses were stationed from 10 to 15 miles apart, and each rider rode three animals successively, traveling not less than 33 miles before he passed his mail bag on to his successor.

The record trip was made in 7 days and 17 hours when Abraham Lincoln's first Inaugural Address was carried; but the regular schedule was 10 days—about 24 days faster than Butterfield's Overland Stage Line. The Pony Express was soon succeeded by the telegraph, but the tales of what those riders faced in the way of danger from Indians, bad weather, and the adventures they had, made great reading when I was a boy.

I am reminded of the Pony Express now by the American Telephone and Telegraph Company's announcement of the opening on Friday, August 17, of the coast to coast new Microwave Radio Relay Skyway. For the first time, telephone conversations will be carried across the continent by radio rather than by wire or cable, and, just as the horses and the riders tired and had to travel in relays, so the electrical waves have to be picked up and strengthened by stations placed at regular intervals across the land.

I predict that the time is coming when you can take up some kind of a gadget and not only talk to a friend a long distance away but also see him face to face.

## EASTMAN'S CHESTNUT

**S**TOCKMEN'S LETTER," issued by the Morrell Packing Company, tells a story about a very proper American who was always exceedingly careful to observe all the proprieties. One day he was having dinner with a fat little foreigner, fond of his creature comforts and his family. As the meal progressed, the foreigner suddenly gave out with a resounding burp.

"Oh, my gracious!" said the proper American, aghast. "Are you in the habit of doing this before your children?"

The other shrugged his shoulders:

"Ve have no rules. Sometimes I go first, sometimes de kids go first."

# AA's Farmers' Dollar Guide

**PRICE PROSPECTS:** At summer meeting of the New York State Horticultural Society at Geneva, Herrell DeGraff gave an outlook summary helpful not only to apple growers but to all farmers. The following comments are largely based on what he said:

Prices are unlikely to skyrocket this fall, may be lower instead of higher. Prices of basic commodities have declined since February, 1951, and have lost half the gains made from June, 1950, to February. Living costs have leveled off at about 9% above a year ago. Food costs are 12% above a year ago, and all farm prices 19% up, but most of gain is caused by meat and cotton, relatively unimportant in the Northeast.

Much of price rise was psychological; consumers feared shortages and bought "before hoarders could empty the shelves." Now, finding no shortages, consumers must use up what they bought, and appear to be buying only at reduced prices! Savings are up.

Food, textiles, autos and buildings account for 90% of American business. Food sales are quite stable, textiles are very slow, automobiles are easy, and we apparently are on the downtrend of the building cycle. It looks as though business will be very competitive in the months ahead without heavy unemployment or critical shortages of goods.

Many people believe all-out war will not come, but that further "incidents" and the danger of war will require continued defense preparations. Recent expenditures of 2 billion a month means a cost of \$14 per month for every man, woman and child. Cost is expected to increase to 3 billion a month (\$21 per person), and may go to 4 billion (\$28 per person or \$140 a month for a family of 5). That would require about 20% of U. S. industrial output.

Question is whether or not that rate can be maintained for several years. Chances would be better if Washington would make drastic cuts in domestic government expenses.

**MARKETS:** For fruit growers (and for all cash crop growers) the indications are for competitive markets at present or slightly lower prices. Crops won't sell themselves; it will take work. Holding for possible price increases doesn't look attractive unless you believe the supply of a particular crop is short of probable demand.

**CROPS:** August crop report shows declines in estimates of several crops, but over-all picture still indicates second highest total crop volume. Wheat—Estimate is 998,286,000 bushels; 72,000,000 below July estimate. Winter wheat, 650,738,000; spring wheat, 347,548,000. Last year, total was 1,027,000,000, and 10-year average was 1,071,000,000. Corn—Estimate is 3,027,000,000 bushels; 88,000,000 below July estimate. Last year, 3,131,000,000; 10-year average, 2,981,000,000. Oats—1,393,000,000 bushels; 5% below 1950 but 6% above average. Buckwheat—4,053,000 bushels, smallest on record. Last year, 4,749,000; 10-year average, 6,976,000. Soybeans—Bumper crop of 270,000,000 bushels, second highest on record. Last year, 287,000,000; 10-year average, 179,000,000. Dry Beans—Estimate is 16,234,000 bags (100 lbs.), smallest crop since 1946; 10% below 10-year average. Potatoes—351,186,000 bushels, 20% below 1950. For 18 surplus late states, 254,651,000 bushels compared to 316,495,000 last year. This year's smaller crop is proof that growers can adjust operations to meet new conditions when they have the facts.

**FRUIT:** Apples—Commercial crop, 121,338,000 bushels, 1% below 1950. Eastern crop is 5% above last year. Peaches—67,772,000 bushels, 27% above last year but 5% below average. Southern states up 300%. North-east some above last year. Central states very short. Pears—31,697,000 bushels, 2% above last year and above average. Grapes—3,244,600 tons, 20% above 1950. In New York, forecast is 64,800 tons; last year, 104,000. Sweet Cherries—1951 production was 73,210 tons, 8,670 below last year; New York about the same as 1950. Sour Cherries—159,000 tons, slightly below last year but 68% above 10-year average. New York crop was 31,200 tons; last year 27,100.—Hugh Cosline

## The Song of the Lazy Farmer

grief; I think she secretly enjoys lambasting me with lots of noise. But I'm surprised that she'd admit she may be putting on a bit; that's something I would like to see put down in written form, by gee.

MIRANDY'S got a new complaint that leaves me just a little faint; she claims I've been completely wrong in talking 'bout her in my "song." The folks, she says, who read my stuff have been long-suffering enough; the very least that I could do would be to make my stories true. Instead, she says, I tell 'em lies and pull the wool across their eyes by making them think that my wife spends ev'ry moment of her life a-fussin' and a-fumin' 'bout the fact that I'm a lazy lout, whereas, says she, the facts are these: She really ain't so hard to please.

Of course, it may be that I've stretched the point 'til it's a bit far-fetched; Mirandy really ain't so bad, she's happy more than she is mad, and I'll admit the times when she is smiling prettily at me outnumber moments when she roars because I don't help more with chores. And, anyway, it's my belief, my laziness gives her no

### VANDALE SILO UNLOADER

UNLOADS HARDEST FROZEN GRASS OR CORN ENSILAGE

Send postcard for free illustrated booklet describing the VanDale Rotomatic Silo Unloader. Cuts hardest frozen ensilage with case hardened knives. Massive hub rotates screw conveyor around silo, cutting and conveying ensilage in one smooth motion to be blown down chute in best possible feeding condition. Scientific design and few moving parts; so 1½ h.p. does the job. Automatically keeps surface smooth and walls clean. Hundreds now in use from North Dakota to New England; saves feed as well as time.  NORWICH, N. Y.

Suzannah born January 2, 1943 and the dam of seven artificially sired daughters, five of whom are shown below.

## A Grand Old Matron

OWNED by Lynn Clark of Delhi, N. Y., Suzannah, the cow shown above, has the notable distinction of being the dam of seven artificially sired daughters. Suzannah was sired by Winterthur Posch Dad Boast Ocapok and has three records averaging 11,500 pounds of milk and 373 pounds of fat.

Mr. Clark's herd averaged 410 pounds of fat for the testing year ending in February 1950. Thirty-three of the forty-five producers in the herd are sired by bulls owned by the New York Artificial Breeders Cooperative.

Two daughters not shown below are Suzzette born December 14, 1948 and sired by Clovercourt Ormsby Royal Blend, and Edith born November 16, 1949 and sired by Carnation Dominator.

Honeybunch born February 21, 1946. She was sired by Chief Piebe Pride Gerb Colan and has two records averaging 14,200 pounds of milk and 533 pounds of fat.

Whiz, whose twin Gee is shown below, was born February 1, 1947 and sired by Granville Regina Prospect. Her one record is for 12,980 pounds of milk and 446 pounds of fat.

Gee, the twin of Whiz shown above, has one record of 11,830 pounds of milk and 445 pounds of fat.

Below, Sadantha was born October 14, 1950 and was sired by Dunloggin Master Adantha.

Jeepers born December 27, 1947. She was sired by Staffordshire Montvic Crusader and has one record of 12,900 pounds of milk and 440 pounds of fat.

# New A B C's of Animal Nutrition

**A** stands for antibiotics . . . **B** for B-12 . . . **C** for carotene . . . and so on down the new alphabet which livestock and poultry people are learning today. There's a long list of newly found aids to better health, faster growth and better gains for livestock . . . to more meat for America . . . to better earnings for producers.

**A for the antibiotics**—aureomycin, penicillin, streptomycin, terramycin, many more. Nobody knows quite why, but added in tiny amounts to hog, calf and poultry rations (not for sheep or adult cattle), they often seem to speed growth, especially of animals in subnormal condition. Most runty pigs catch up with the litter, make 10 to 20% faster gains. Diseases in turkey flocks can be reduced, and the time from poult to market-weight bird speeded up.

**B for B-12**—We know now that this is the vitamin which made APF famous. Found in its natural state in such packing house by-products as meat scraps and tankage (also manufactured by fermentation process), this working partner of the antibiotics is making more meat at lower feed cost. Broilers, for example, are ready for market in 10 to 11 weeks, instead of 12 to 15.

**C for carotene**—Found in the green leaves of growing grasses, legumes and other plants, carotene helps cattle, hogs and poultry produce vitamin A as they digest their feeds. Vitamin A is a must if livestock is to live and be thrifty.

Those are a few of the many new things recently learned about the science and economics of animal feeding. In a very few years research has added many pounds to the meat output per acre of grass or grain—shortened feeding periods, increased animal livability. All of this adds to the supply of meat for our people, and is the farmers' and ranchers' contribution to our country's strength.

And many other promising things are probably over the horizon. Experiment stations are working on the use of thyroproteins and hormones in cattle feeding. There's growing knowledge about the importance of cobalt and other trace elements to livestock. At federal and state experiment stations, in many a private laboratory, these and many other little-known areas of animal nutrition are being explored and charted. And thus, as has happened so often in the past, the study of animal nutrition is blazing the trail to better human nutrition also. Your local county agent, your high school and college agricultural instructors, your agricultural publications can keep you informed.

## Quotes of the Month

"In the democratic way of life it is not 'the best things in life are free,' but rather 'the best things in life are worth working for.' Certainly good food is one of the best things in life."

Dr. Ruth M. Leverton  
Professor of Nutrition Research  
University of Nebraska

"How can consumers be educated to the fact that food will have its price, in regular market channels or in the black market, and not because farmers say so, but because they, the purchasers, say so?"

Dr. Herrell De Graff  
National Institute of Animal Agriculture

### OUR CITY COUSIN

Says City Cousin, "What the deuce! This cider tastes like apple juice!"

## Big "Know-How" is Good!

In times of national emergency, I often notice quite a change in the thinking of some folks. I have in mind those who criticize business just for being big.

However, when up against the need for large scale production and distribution of materials and food, the government often turns for "know-how" to businessmen—little and big. This, of course, is a sensible thing to do. And isn't it fortunate that our nation can take advantage of the fact that we have a ready source of successful and experienced management to turn to?

Another thing. When emergencies arise, it's often in business that we find the specially trained manpower used to dealing with big, complicated problems and big, complicated operations. Many businessmen resign from their companies and join the government—to help handle the problems created by the emergency. Others give their experienced counsel on the organization of many important government projects.

Personally, I have never gone along with those who argue that it is bad to be big. For bigness means growth and is a reward of valuable service. It is my own conviction that business—both "big," medium and small—helps the American people live better, at lower cost. And I maintain that our nation's businesses of all sizes form one of the essentials in the defense of all the big and little things for

### Martha Logan's Recipe for BEEFARONI SALAD

Yield: 2 qts. (8 to 10 servings)	2 tbsp. pickle relish
1 pound hamburger	2 tbsp. finely chopped onion
2 cups shell macaroni	1 teaspoon salt
1/4 cup chopped onion	2 cups salad dressing
1 teaspoon salt	1 carrot, shredded

Brown the hamburger slightly. Drain off drippings and chill the meat. Boil macaroni and 1/4 cup onion in salted water 15 minutes. Drain and chill. Combine chilled hamburger, macaroni, pickle relish, finely chopped onion, salt, salad dressing and carrot. Mix well. Chill about 2 hours.

Variation: Add 1/2 cup chopped celery, 2 tablespoons chopped green pepper, or 1/4 cup sliced pimiento olives.

## A Meaty Mouthful

Americans all like to eat good wholesome food, especially meat. To you producers we give praise, and gobble up the meat you raise. It seems we never get too much of beef, pork chops, veal, lamb and such. And so demand "eats up" supply as U. S. housewives buy and buy. Yet prices vary, week to week, for reasons not too hard to seek. When scads of hogs pour into town, the price of pork then soon comes down; but when hog marketings are slow—why, up pork's price is sure to go. Still, whether prices rise or fall on meat, we eat it all. The problem's never surplus meat—you can't raise more than we can eat. But prices change, across the land, as you supply and folks demand.

### Soda Bill Sez . . .

Government controls are like thistles in a corn field . . . they grow fast and are hard to get rid of.

## Balance Roughage and Concentrates for Lambs

by Rufus F. Cox  
Head of Animal Husbandry Department,  
Kansas State College, Manhattan, Kansas

Lambs fed the most concentrated rations do not always fatten fastest nor most economically, Kansas experiments show.

A series of experiments has been run to test the physical balance of rations. They were designed to determine whether the ratio of concentrates to roughage was a factor in determining the efficiency of feed utilization.

The most noteworthy result of these tests is that regardless of the kind or combination of feeds used, lambs fed rations of medium concentration made larger and more economical gains and were as well finished as lambs fed either more bulky or more concentrated rations. It was concluded from these experiments that an optimum physical balance actually exists for lambs. Thus as bulky rations are increased in concentration, the gains increase up to a certain level. Then, as the concentration is further increased, the gains and efficiency of feed utilization turn downward. It was further proved that the gains made by lambs are not always positively correlated with either the dry matter intake or the total digestible nutrient intake. Rather, the gains and the efficiency of feed utilization clearly follow a certain balance between these two factors.

Experimental work at various State Experiment Stations is showing that physical balance in rations for ruminants may be fully as important as chemical balance.

## Swift & Company

UNION STOCK YARDS, CHICAGO 9, ILLINOIS

Nutrition is our business—and yours

New Holland's "77" automatic twine-tie baler can package up to 10 tons of hay per hour—hour after hour!

## "You can count on New Holland for highest capacity—highest performance"

says Walton W. Thorp—Thorp Hereford Farms, Britton, S. Dakota

● "When you're putting up enough feed to carry 1,000 registered Herefords through one of our long Dakota winters, the hay season seems mighty short," says stockman Thorp. "Our New Hollands are in the field as soon as the dew's off and running right up to darkness."

"We depend on our '77's" to get a big job done fast, and they have our highest recommendation."

There's a slim margin between good hay stored in the barn and spoiled hay lying in the field. You can count on a New Holland "77" to make that difference.

The "77" with its high capacity—up to 10 tons an hour—helps you beat rain and sun damage. The "77's" floating pick-up handles the windrows big as they come. Its open-end feed auger sends a steady flow of hay to the baling chamber without clogging. Inverted twine knotters clean themselves—tie hundreds of bales without a miss.

Baling action is designed to save nutritious leaves and blossoms. This assures quality feed for your stock with fewer costly grain rations.

Walton W. Thorp with TH Royal Domino 37th, bred on Thorp Hereford Farms.

You have little "down time" when you bale with a "77". All steel in construction, it is of simplified design with 20% fewer parts. 500 owners reported an average maintenance of \$21.40 per season—many had no maintenance costs.

These are some of the reasons why farmers count on the "77" to put up good hay as fast as possible and at the lowest possible cost. For details, see your New Holland dealer soon. New Holland Machine Co., New Holland, Pa. A Subsidiary of The Sperry Corporation.

New Holland Twine is certified by the United States Testing Co. to have met its rigid standards of uniformity, quality and strength.

From left, Mr. Evans, Mrs. Clayton Snyder, Neffs, Pa., the champion; Mrs. Royal Bence, Watertown, N. Y., the runner-up; and the third prize winner, Miss Mary Harper, Goodwood, Ontario, Canada.

## In Honor of "SPUDS"

PARING KNIVES flashed as the women attacked their individual piles of New York State potatoes to determine the champion potato parer at the 17th Annual Field Day of the Empire State Potato Club. When the peelings all settled and were weighed by the judges; the pared spuds checked for any spots that were missed; and the elapsed time compared, Mrs. Clay-

crowd estimated at more than 12,000 toured the Oneida County farm of Wells Aldrich at Sauquoit, N. Y., to witness demonstrations of everything from digging and plowing to potato washing, irrigation and airplane dusting. As usual at the Field Day the Trade Show proved to be the center of interest for thousands of potato growers attending. About 50 dealers and manufacturers were present with the latest equipment and machinery for raising and handling potatoes.

Milton E. Hislop, Oneida County Agricultural Agent, was general chairman of the Field Day, which was put on by the Empire State Potato Growers Club in cooperation with the New York State Extension Service. Experts demonstrated and discussed everything from new and promising potato seedlings to chemical weed control.

Finalists in the contest where New York State Potato Queen Diane Dickinson was chosen, were: Misses Janice Brownell, 17, of Cassville, Oneida County, alternate choice; Theresa Meyer of Ithaca, Tompkins County; Arlene Ald-

The 50 machinery and equipment exhibits made the Field Day Trade Show more popular than ever. Shown looking at a new hydraulic lift on a potato planter are Harold Billings, who has 45 acres of potatoes at Prattsburg, Steuben County, left, and his son-in-law, Melvin Partridge, who works for one of Steuben County's largest potato operators, Harry Goodrich and Sons of Avoca.

ton Snyder of Neffs, Penna., emerged as the champ. Winner of the second prize was Mrs. Royal Bence, Watertown, N. Y., while a Canadian, Miss Mary Harper of Goodwood, Ontario, captured third prize.

The potato peeling event and the choosing of Miss Diane Dickinson, 17, of Fulton in Oswego County, as New York State Potato Queen, were entertainment highlights in a very full program packed with interest from 9 in the morning until 4 in the afternoon.

During the day a

inger, Lancaster, Erie County; Betty Jean Hiscock, of Lafayette in Onondaga County; Shirley Foster of Savannah, Wayne County; Janice Hohorst, Prattsburg, Steuben County; Elsa Shearing, Gainesville, Wyoming County; Maria Emerling of Boston, Erie County; Janet Usher of Tully, Onondaga County; and Mrs. Stella Armison of Fillmore, Allegheny County.

Pretty 17-year-old Diane Dickinson was crowned 1951 New York State Potato Queen at the Field Day. She is shown above with, at left, Lieut.-Governor Frank C. Moore, who officiated at the coronation ceremony, and Wells Aldrich on whose farm near Sauquoit, N.Y., the Field Day was held.

**THIS ATLANTIC  
ONE-STOP SERVICE IS  
A GREAT THING  
FOR A BUSY FARMER**

**That's what Harry Erwin told me** the first time I drove up to his farm. "You know," he told me, "I've had my gasoline, tractor fuels, kerosene and fuel oils delivered for years. But it always seemed that all the things I wanted were never on the truck."

Well, just to show both you and Harry that won't happen now, we unloaded every compartment of my new truck, and had this picture taken. Not much chance of my running out or not having enough, is there?

**"And these ticket printers,"** Harry said, "tell a man what he's getting. I see it in black and white, and I've got a record for taxes. And I don't even have to be on hand."

**"I like your** having separate tanks, meters and hoses for gasoline and oil, 'too," Harry told me. "There's no chance of any gasoline or tractor fuels getting in a kerosene or fuel oil tank that way."

**Just before I left, Harry said,** "You know, this is the first time I've ever been able to get all I wanted at one time. And I like it! Because when a man's busy he just doesn't like to fuss around waiting for a gallon of this or that." You can see from what Harry Erwin said that he's mighty glad he called us. And we think that, if you give us a try, you'll be happy about it too. We'll do our best to give you good service. And we've got the finest products you can buy . . . Atlantic products. So let's hear from you. All it takes is a telephone call.

# Self-feeding Silos Show Promise

By **EARL D. MERRILL**

**S**ELF-FEEDING silos are one of the many new ideas that livestock people are talking about for cutting costs and saving labor. Much has been done to save labor in field operations, but we are just beginning to figure out ways and equipment to save time on chores. Many a farmer who did not like the idea of climbing up and throwing down silage has been speculating on how this chore could be avoided. Trench silos, silo unloaders, and the new glass-lined silo with a bottom unloader are partial answers. A few farmers have used a conveyor and feed bunks in conjunction with a silo unloader.

Four years ago, a farmer in Indiana and another in the Hudson Valley put up silos with openings at the bottom and a cone in the center of the floor so that the cows could help themselves. They were largely modifications of the self-feeding cylindrical hay structures. But due to faults in the design, the silage did not feed down satisfactorily. This new self-feeding idea has been called a "cowfeteria."

## Persistence Gets Results

Finally, in 1949, Paul Mazur of Fiddler's Creek Farm, Lambertville, New Jersey, working with Professor Charles H. Reed, Department of Agricultural Engineering at Rutgers University, divided a 12' x 28' rectangular self-feeder into four 6' x 14' compartments and filled them with grass silage which fed down satisfactorily in the small experimental bins. Professor Reed also worked with D. W. Ruedemann of Plainsboro, New Jersey, in developing the basic principles of a successful design in two 14' x 40' cylindrical silos. This new idea worked successfully with corn silage on Mr. Ruedemann's farm. Mr. Ruedemann liked the idea so well that he now has four self-feeding silos with some modifications from the original design. Two of these silos are 14' x 40' and two are 14' x 50'. He and Mr. Mazur used their silos in conjunction with self-feeding hay barns.

This experience led to the erection in 1950 of 14 other self-feeding silos—2 by the New Jersey Experiment Station, 4 on New Jersey farms, 3 in Maryland, 2 in Wisconsin and one each in Kentucky, Indiana, and Kansas. Several additional self-feeding silos are being erected this year—including two by state colleges of agriculture in Pennsylvania and Michigan. These silos

were all modifications of the 1949 New Jersey designs.

They varied in diameter from 11' to 16' and in height from 25' to 50'. They included wood, steel and concrete stave silos. A new silo at Fiddler's Creek Farm has a square base and an "A" shape divider instead of a cone. For unexplained reasons, this silo appears to function better than most of those with round bases.

## Grass Brings Difficulties

Most of these silos were filled with grass silage in 1950. However, the grass silage did not feed down as satisfactorily as the corn silage. In fact, great difficulty was experienced in some cases. Dynamite and various devices were used to work the silage loose, and one silo in Wisconsin collapsed.

The engineers and some of the farmers working on these self-feeding silos, however, are confident that some further modifications in design and, possibly, changes in methods of filling and feeding will lick this difficulty with the grass silage. The idea is too good to give up. Yankee ingenuity and persistence should come up with the right answer.

The basic design is neither complicated nor expensive. While any farmer with the help of a welder and mason can put one up, the steel parts eventually will probably be produced by a manufacturer. A conventional silo without doors or chutes is erected on the self-feeding base. This base in almost all of these silos is made up of a ring of 8 to 12 "H" beam posts about 60" high, securely anchored in the silo foundation wall and feeding curb. An angle iron ring is bolted or welded to the top of these posts. The silo is set on this ring. A sharp pointed concrete cone not more than 60" high and with a smooth 45 to 60 degree slope is built in the center of the silo floor.

Several kinds of doors have been used to close the openings between the posts. Most of these silos were set up outside in the barnyard with a concrete feeding apron around the base and most have a flexible swinging gate of 2"x 2"s or 2"x 4"s hung from the top of the opening and spaced with chains so the cows can reach through to eat. These gates keep the silage from falling out if the silage comes down too fast, and they prevent the cows from getting caught in the silo.

How did the idea work out? While the experience was not exactly the

# Shoemaker Heads New Market Group

By L. B. SKEFFINGTON

DONALD SHOEMAKER of Webster is the first president of the Genesee Valley Regional Market Authority, organized under an act of the Legislature last winter. W. Lorenzo Palmer of Williamson is vice-president; Joseph W. Robson of Hall, secretary, and Ward A. West, treasurer. Members of the executive committee are Shoemaker; Anthony H. Garnish of Elba; Kenneth A. Noble of Linwood, and Robert G. Wilcox of Albany, who represents State Agricultural Commissioner DuMond on the Authority.

Shoemaker was chairman of the nine-county growers, committee which for years conducted studies and carried on a campaign for establishment of the market authority. Expression among farmers is that the membership of the authority, appointed by supervisors of the nine counties, is exceptionally well representative of the farm interests of the region.

The authority is holding frequent meetings, in spite of the fact that the law limits compensation of members to a maximum of \$60 per year. No decision has been made as to where the market will be located, but informal discussion indicates a site somewhere south of Rochester adjacent to arterial highways. As a first step, members will visit other markets and will begin studies to develop preliminary plans for a market.

## Weather

Weather has continued to be the chief controlling factor in farm operations upstate. Many crops have suffered from lack of rain. At Gannett Farms our rain chart showed five-eighths of an inch July 22 and nothing again until we had six-tenths of an inch August 21. Pastures which were exceptionally good up to August 1 deteriorated rapidly after that date. Indications are that unless there is considerable rain right away feeding of grass silage will be in order. This year it is apparent that much more grass was ensiled than ever before, partly due to frequent showers in early June and the lush growth on meadows and improved pastures.

Corn, potatoes, dry beans and some other crops show the effects of lack of rain, but generally the second cutting of alfalfa hay was excellent. A heavy crop of sour cherries in the lake counties was harvested without interference of rain. The main delay in getting the crop off was capacity of processing plants. The Montmorency variety moved generally at six cents a pound and English Morellos at eight. Peaches have been ripening rapidly, with good demand for the early varieties.

## Fairs Doing Well

I have been to several county fairs so far and noted that several vegetable displays were larger and more attractive than in several years. I don't know the reason, unless it be that growers have become ashamed of some of the sparse, unattractive displays I have seen in recent years. At the Seneca County Fair fruits and vegetables were displayed on damp peat moss.

## Apple Marketing

The Western New-York Apple Growers' Association, with a sign-up of six million bushels, has been through its first marketing year and is planning for the second. It is faced with the unusual situation of the third large apple crop in as many years. Cameron G. Garman of Burt, association president, says this calls for the most intensified effort which the association can put forth.

"All of our directors are apple

growers," he says, "and they know the problems growers are facing. We are leaving no stone unturned to develop markets for good apples. We have been organized just long enough to have gained some experience which should help us this year. We are hoping that we can have a strong demand for apples early in the season and keep them moving constantly. Naturally, that means we have got to emphasize the quality of the pack."

— A. A. —

## MILK ORDER AMENDMENT COMING

As a result of hearings held at Elmira last spring, some amendments to the Milk Marketing Order for the Metropolitan Area have been proposed by the United States Department of Agriculture. More and more, milk order provisions are becoming too complicated to be understood without detailed study, but the effect of the amendment will be to raise the price of Class III milk about 3c per cwt.

Cooperatives and others interested in milk are submitting to the department any objections to the proposals and after they have been studied an amendment will be offered to dairymen for their approval.

The estimated uniform price for August milk for the Metropolitan Area is \$4.51.

— A. A. —

## SELF-FEEDING SILOS SHOW PROMISE

(Continued from Opposite Page)

same in all cases because of differences in silos and silage, it was the same for the most part on certain points. Even though doors for the base were not too well made, there was very little spoilage at the bottom on opening or later in feeding; there was surprisingly little wastage; the cows getting into the silo with their front feet did not prove to be objectionable; freezing to the sides of the silo did not appear to present a problem even in Wisconsin, but when temperatures approached zero, the exposed silage at the bottom froze so the cows could not eat it. Rutgers University licked this problem by closing the openings with plywood sheets and using a small oil heater in the coldest weather.

When the silage came down O.K. the cattle ate more silage than normally had been fed. Because of the longer period of exposure, there was considerable spoilage on top. Several self-feeding silos will be equipped with the new synthetic rubber silo caps this season to reduce this spoilage.

Many farmers are asking about building a self-feeding silo. Those working on the problem are advising that if the silo is planned for grass silage, farmers may avoid mistakes by waiting another year until some further new ideas can be tested. It is recommended that anyone building a self-feeding silo should work with agricultural engineers at their state college of agriculture to avoid making mistakes in design.

Here are the arguments for a self-feeding silo: It saves all the labor of handling silage after filling; gives the cattle all the silage they can eat; increases the use of silos.

The self-feeding idea holds out the most promise for the beef farmer and for the dairyman with a pen stabling set-up. It is a natural complement to the self-feeding hay structure.

This is but one of the new tools being developed to cut costs in the new grass-animal agriculture.

## FARMERS TOLD US:

"We want BOTH FM and AM!"

## Super-powered FM-AM RADIO

WHEN you live in the country, extra power and freedom from static are more important than ever in a radio. That's why farm families want *both* FM and AM. This beautiful new 2-in-1 model brings you famous General Electric FM radio with crystal-clear reception, virtually free from static, fading, station interference. *Husky 7-tube chassis actually outperforms many consoles!* Powerful AM radio, too, for standard broadcasts. Full-size G-E Dynapower speaker for magnificent tone. Rich, modern mahogany plastic cabinet, highlighted by a big, gorgeous "sunburst" dial. What an ideal radio for the farm—for *your* farm! See G-E Model 408 today—it's the finest table radio G.E. ever built! **\$54.95\***

## The "Daddy" of Power Sprayers

THIS sprayer attracted much attention at the summer meeting of the New York State Horticultural Society at Geneva. From left to right, the men looking at it are:

Morris Butts, Sodus; Jim Clarke, Milton; Sam Dillon, State of Maryland; Horace Putnam, Lyons; and Bruce Jones of Hall, whose father-in-law built the sprayer.

The sprayer was built by T. B. Wilson of Hall, N. Y., and was used about 1895. It was steam operated and oil was the fuel. If you know of an older power sprayer, we would certainly like to have the information. T. B. Wilson was the father of Charles Wilson and the father-in-law of Bruce Jones of Hall.

Mr. Sam Dillon of Hancock, Maryland, told those attending the meeting that it will be profitable to analyze this year's market. Last year, he said, some of the troubles were: that it was a late season (over which, of course, growers had no control); that consumers were stretching their finances to buy automobiles and refrigerators instead of fruit; that producers put prices too high, remembering the de-

mand in war years; that the quality was poor; and that growers didn't realize until too late that apples weren't moving.

Mr. Dillon emphasized the need for advertising and publicity, and said that it is extremely important to move a good proportion of the crop before December 1.

Jim Clarke of Milton, N. Y., reported as chairman of a committee appointed at the Hudson Valley meeting of the Society to study the most important fruit problems. Jim reported excellent cooperation with Hudson Valley Farm Bureau Fruit Commodity Committees and the Hudson Valley Association of Refrigerated Warehouses.

The Committee has recommended broader support of advertising and promotion, better market information, more attention to grades and quality control, a renewed interest in removing unprofitable trees, and more attention to contacting retailers who sell the fruit.

Dr. Herrell De Graff, Babcock Memorial Professor at Cornell, reviewed the economic situation. Turn to page 5 for some of the conclusions he reached.

## Vegetable Growers Visit Geneva

THE summer field day of the New York State Vegetable Growers Association at Geneva August 11, 1951, was more like a big neighborhood picnic than a state fair, and it was good. The 600 or so growers, families and friends had an unusual opportunity to see the work of the New York State Experiment Station, much of which is concerned with vegetables. Special emphasis is given to production for processing and to the processing itself. Everything but the money and materials have been ready for a long time to build a great laboratory and pilot processing plant for Dr. D. B. Hand and his associates. This work has been going on for years on a small scale and with inadequate facilities.

C. B. Sayre is head of the Vegetable Crops Department, and the work includes breeding for better varieties of tomatoes, sweet corn, snap beans, peas and squash; extensive rotation, fertilizer, and irrigation experiments and studies of tillage and conservation practices. Use of sawdust or wood-chips seems promising to improve tilth of soil, provided supplemental nitrogen is added. Disease and insect work with vegetables receives emphasis in the respective departments. A low gallonage spray rig which saves the handling of many barrels of water was demonstrated. New seed treatments are proving effective as protection against soil organisms and maggots which ordinarily

reduce stands of green and dry beans, especially limas.

Dr. J. D. Luckett was in charge of plans for the day and he had prepared a map of the station farms showing just what was to be seen at each place and how to get there.

Seneca Castle Grange served excellent food, cafeteria style, and the visitors took advantage of the beautiful day to picnic under the trees of the Station "campus."

After lunch, Director Arthur J. Heinicke reminded growers of their essential role in research—bringing in problems, asking questions, and keeping in touch with the scientists as work progresses, all of which helps them to keep on the right track.

Austin Avery of Syracuse, a vice president of the N.Y.S.V.G.A. presided for the speaking and introduced Webster Birdsall of the N.Y.S. Dept. of Agriculture and Markets, who bestowed upon Miss Clara Hay of Baldwinsville the crown as Vegetable Queen of New York. The charming and gracious young lady is the daughter of Mr. and Mrs. George Hay who live on a vegetable farm. Clara has long been active in 4-H work.

Peter Vercrouse, veteran muckland vegetable grower of Oswego, was introduced and spoke briefly, winding up with a plea for faith in God and belief in one's self.—Paul Work.

A big hopyard near Malone in Franklin Co., N. Y. Photo taken May 26.

## "North Country" Grows Hops

**F**OR many years, hops have been grown in New York State. They have had their ups and downs, the most recent "up" being in Franklin County, N. Y. North of Malone there are several hopyards, the largest being 135 acres owned by John Siegel of New York City who, we were told, is a hop broker.

This yard was started three years ago. Some Bavarian hop cuttings were flown from Europe, but were very disappointing. The plants were then secured from Oregon and, more recently, cuttings have been secured from the vines right on the farm.

The early vines set out were spaced

9 x 9 feet, which gives 560 vines to the acre, but now they are being set 8 x 8 feet. This permits cultivation both ways, which helps in weed control. Posts to hold the wires are cedar and cost between two and three dollars apiece. Each vine has two strings which it can climb, and two branches only are allowed on each string. A great deal of hand work is necessary to remove unwanted vines and to train them up the string.

I was told that in a nearby ditch dug for a water supply, hop roots were actually discovered to be 26 feet below the surface of the ground. The ground around Malone is very sandy. To date about two shovels of rotted manure

have been used per plant in the fall, partially for winter protection. Also about one pound per plant of 5-10-10 fertilizer is used when plants are first set out, and the same amount of 10-10-10 is used when plants get older.

The harvest begins about August 10. Twelve hundred pounds of dry hops are considered a good yield and the price has been around 80 cents a pound.

In the old days, a considerable amount of glamor surrounded hop harvest in northern and central New York. Entire families worked in the fields. The evenings around campfires afforded unmatched opportunities for developing

any latent talent for entertaining, as well as for nurturing budding romance among the younger generation.

To the casual observer the gross income from hops does not point toward sudden wealth when you consider the cost of raising an acre of hops, but there has been much interest, both locally and by tourists. For example, last fall a car stopped and a man came over to make inquiry saying that he and his wife disagreed, his wife claiming it was buckwheat and he claiming it was not, and to stop further argument they wanted someone to settle the argument. —Hugh L. Cosline.

# CO-OPERATION

## The Straight Road to Farm Prosperity and Independence!

We farmers value our independence. We choose it in preference to the high wages of the city with its countless bosses, foremen and supervisors.

Yet, today, farm independence is being threatened by the city . . . particularly by the demands of city labor leaders and other high wage earners for below-cost food and farm subsidies. Demands that lead straight to farm regimentation, regulation and allocation . . . and to all the government dictation that fixed prices and food subsidies mean.

### Co-operation is Our Only Hope

Yes, farmers can escape this threat to their independence. But the way to do it is by self-help . . . by co-operative effort among farmers for farmers.

For almost 50 years, the Dairymen's League has been showing the way. Before World War I, we acted as a bargaining agency. But in the distressed days of 1920, we found we could not bargain for prices when supply was greater than demand. So we re-organized the League into a co-operative marketing association.

Our leaders came up with the practical idea of the Classified Price Plan . . . and with the equally practical idea of pooling returns so that all producers shared equally in existing markets. That did away with one farmer underbidding his neighbor to gain a choice market. It did away with price cutting.

### We Even Sold At Retail

Our Association went further in some markets and delivered milk direct to consumers. The facts and figures of that operation enabled us to set up yardsticks by which we could measure the actual costs of distribution, and determine the prices which dealers could afford to pay producers for milk.

Co-operation as practiced by the Dairymen's League has brought benefits to all producers in the milkshed. The Classified Price Plan and Equalization of Return have been adopted in most major markets throughout the country.

But co-operation—if it is to yield its greatest values in this milkshed—must mean the co-operation of *every* dairy farmer with *every other* dairy farmer. Numerical strength is vital . . . particularly in such political matters as price controls and food subsidies where we are being opposed by powerful consumer groups. So let all of us join together. Let us unify our thinking and our actions for the defense of our farm way of life, our farms and our economic and political freedom. We members of the Dairymen's League invite you to be one with us.

## DAIRYMEN'S LEAGUE

*Co-operative*

**ASSOCIATION, INC.**

## Question Box

Mainly as a result of reading articles in your magazine, I planted three acres of birdsfoot trefoil in the spring of 1950. That summer we had a fair catch and only clipped the field to get rid of the weeds. We fertilized it last October. This spring the stand was much better, so we cut it the middle of June and put it into the silo.

The second growth is coming along pretty well, but it is quite patchy so I am most anxious to give it every chance to reseed itself. For this reason I am writing you as I have yet to read in any of your articles the process by which birdsfoot reseeds itself. To ask a specific question: Is it necessary to let it flower and then head in order to get the best results? If so, is it wise to pasture the field after the plants have headed, especially in view of the fact that this is only the second summer for the plants?

It is unnecessary to provide for re-seeding, as the individual birdsfoot trefoil plant grows to a considerable size, covers quite an area, and lives for many years. That is one reason why it is such a valuable plant, because you can seed it on hilly land that should not be cultivated and can leave the field in birdsfoot for a long period of time.

From observations we have made, it seems that it is difficult to damage birdsfoot by grazing, although of course any plant should have a rest period and an opportunity to store nutrients in the roots. In general, the biggest damage to any pasture plant is to continue to graze it too closely late into the fall.

I would like to know how much soil cable I should use for a hotbed 4x5 feet?

For the usual 110 volt power line the cable should be in 60-foot lengths and one 60-foot length should be enough for a hotbed 4 x 5 feet. I would suggest that in placing the cable you start 3 or 4 inches in from the outside of the bed and make a coil completely around it. The balance of the cable should be coiled back and forth through the bed, distributed as evenly as possible.

If you are growing your plants directly in the soil then the cable should be covered with approximately 6 inches of soil. However, if you are growing your plants in flats which are set on top of the soil, then 2 or 3 inches of soil over the cable will be enough to give a good distribution of the heat.

—A. J. Pratt

I plan to build a silo and I do not know whether to use concrete blocks or cinder blocks. Will you please advise me?

I will have to confess that I have never seen a cinder block silo. From my knowledge of cinder blocks I doubt that they could be used successfully for building a silo. Since cinder blocks are extremely porous, in order to have the silo walls air-tight and reduce excessive spoilage the inside surface of the silo would have to be well-plastered with concrete mortar containing no lime. Should the plaster coat crack, the wall would not be tight at that point. A second objection would be the difficulty of getting sufficient reinforcing to withstand the pressure of the silage on the lower part of the walls.

The use of standard concrete blocks for silo construction would involve the same difficulty of reinforcing. It would be possible, however, to secure a tight wall since concrete blocks are not porous as are cinder blocks—especially if the masonry joints were well made. I recommend that you build your silo of regular concrete silo staves which are made for the job. I am not sure that they will be any more expensive than a standard concrete block would be, but should you find they are, I believe the extra cost would be good insurance that you would have a more satisfactory silo.—Paul Hoff.

## From the Editor's MAILBAG

### LARGER STALLS MEAN FULLER MILK PAILS

**C**OW comfort is profitable. If you give her room, you'll find your milk pails are fuller and your medical expenses are lower.

Research findings by the West Virginia Experiment Station showed that cows in larger stalls produced from 2 to 12 pounds more milk each day, and they were easier to keep clean. Over a three-year period there were 10 injuries in the comfort stalls compared with 20 in smaller stalls.

Comfort stalls for Holsteins measured 48 by 84 inches while the small stalls were 42 by 56 inches. Increased production resulted in \$45 extra income per cow per year, according to the research report, plus the saving due to fewer injuries.

Chore time remained the same in both size stalls, but the larger ones took an extra two pounds of bedding.

It is recognized that many farmers have old barns they have had to make do. Some of the stalls are so small that when two cows lie down, the middle one has to stand. In the long run, this condition is not economical.

If you are remodeling look into the latest research on barn specifications so that your new barn can help you and your dairy animals to be more efficient.

—Lucien D. Paquette

—A.A.—

### TIME FOR A CHANGE

**A**S A CONSTANT reader of AMERICAN AGRICULTURIST, I have noted your courage and your convictions about some developments in the past few years.

I recall a statement by Abraham Lincoln: "There is an important sense in which the Government is distinct from the Administration. One is perpetual, the other temporary and changeable. A man may be loyal to his Government and yet oppose the peculiar principles and methods of the Administration."

This quotation appears apt for the present time when there seems to be such an effort to turn our economy into a socialistic scheme. Today we have the spectacle of an effort to control inflation, while doing the very things that make it.

Your plain English and your courageous stand have been of special interest, and I deem it may not be out of order to write you and compliment you on your good work. The Farm Bureau, the Grange, and other farm organizations have become awakened to the propaganda pressed upon us. It may be well for the American people to begin to look for leaders who believe in those old homely principles that have made America great. We are fast traveling the socialistic road. Have we already gone too far ever to regain our "way of living" for Americans?—F. M. Danna, Vergennes, Vermont.

—A.A.—

### SENT BY DUCK

One night, recently, we solved a problem that may help someone else. We were putting up an electric fence. The fence was in a building below the railroad tracks and our pasture was above the tracks. How to get the wire under the tracks through a sluiceway (about 75 feet) baffled us. Finally, we spied one of our ducks and tying a string to one leg we turned her loose

at one end of the sluiceway. She waddled through and pulled the string with her. We tied our wire to the string and presto! — all done thanks to the duck!—Mrs. B. H. Robinson, Robinson's Fruit Farm, Burdett, N. Y.

—A.A.—

### SQUIRREL TROUBLE CURE

Our house was over-run with squirrels and they did considerable damage destroying records in desk drawers, etc. After months of trying everything we mixed antu rat poison with peanut butter and dry oatmeal. Rolled into pellets, we place them in the attic at logical spots and have never been bothered since. —A. D. Miller, Wellsburg, N. Y.

—A.A.—

## It's Handy

### HOME MADE LAND ROLLER

Two discarded hot water tanks welded together made this land roller, used by Marshall S. Holman on his

fruit and vegetable farm in Hampton, New Hampshire. — M. S. Holman, Hampton, N. H.

\* \* \*

### SCALDS HOG WITH TRACTOR

I find my tractor very convenient for butchering a large hog with little or no help. I get everything ready, then kill and bleed the hog, roll it on to a stone boat, and pull it to a large tree where I have chained a pulley to a large limb, with the scalding barrel beneath it. I then use the tractor to pull the hog up with a hook fastened to its nose and lower it into the scalding water until the hair slips, then lower it and insert the gambrel stick and scald the front end. I can hold it with the tractor while I scrape and clean it or slide the gambrel stick on to a supporting pole. The wire stretcher is also useful in handling the sides and quarters when cutting up.

NOTE BY EDITOR: Sure would make it a one-man job.—I.W.D.

\* \* \*

### HANDY GATE

I have a handy way of gaining entrance to a barnyard protected with an electric fence, without having to unhook the fence.

I made a gate, or rather an opening, by setting two poles 18 inches apart. They extend 6½ feet above the ground, and the tops of the poles are held together by wire. This opening is too narrow for any animals to pass through but I can get through it easily.

The fence is handled by passing a wire over the gate opening. It is hooked to the sides of the poles with ring-type electric insulators and to the top by ordinary nail-type insulators. The current doesn't get interrupted, and I don't get shocked! — Vincent Aldrich, Fredonia, N. Y.

# Ask your druggist for these 2 proved treatments for MASTITIS

## NOTE THE THOROUGH DISPERSION OF SQUIBB OINTMENT IN A TREATED QUARTER SQUIBB PENDISTRIN\*

Each tube of Squibb PENDISTRIN contains 100,000 units of penicillin plus 100 mg. of dihydrostreptomycin. This potent combination of antibiotics makes PENDISTRIN especially effective for nearly all kinds of mastitis cases—and particularly those caused by Staphylococci. PENDISTRIN is stable, non-irritating, won't discolor milk. It comes in the "instant-use" tube—requires no refrigeration.

### SQUIBB PENICILLIN OINTMENT

This is now a 3-year success in treating 9 out of 10 cases of mastitis (those caused by Streptococcus Agalactiae). Millions of cases have been successfully treated. This product is stable, non-irritating, won't discolor milk. Write for special literature on PENDISTRIN and PENICILLIN OINTMENT. E. R. Squibb & Sons, Veterinary and Animal Feeding Products Division, Dept. AA-9, 745 Fifth Avenue, New York 22, N. Y.

For accurate diagnosis of mastitis, consult your veterinarian.

The nearly-completed home which the Spicers built.

## They Built It!

By **GEORGE DOWDELL**

**I**F YOU lack the cash to buy a home or to hire a contractor to build it, consider building one in your spare time. That's what Mr. and Mrs. Kenneth Spicer who lived near Bellefonte, Pa., did!

Mr. Spicer is associated with his father in a cattle business and the operation of the family farm. Mrs. Spicer works in a Bellefonte store, so you can see that the construction was really a spare-time project. In World War II, Kenneth fought through the battle of

and Army experience to do such work as constructing the foundation and installing plumbing for a modern kitchen, basement laundry, bathroom and downstairs lavatory.

As the work progressed, Mrs. Spicer who is a naturally skillful woman, learned to do more and more of the work. "She worked at the job like an old hand," Spicer said. "In fact I sometimes think she did a better job than I could have done, but I shouldn't admit it."

Mrs. Spicer puts down the flooring as part of her contribution to the home-building project.

Kenneth, of course, did most of the heavy work, including plumbing and wiring, but it was a thoroughly cooperative project. Mrs. Spicer did her share by laying floors, shingling the roof, and helping with the lighter carpenter work. The only work hired was plastering, which cost \$285. Both Mr. and Mrs. Spicer say, "That is one job that a couple of amateurs should not tackle!"

Mrs. Spicer feels that building a home is a real job but worth the effort. The kitchen alone, she says, repays her for her share of the work. By

doing their own work the couple figure that they will have a home with a conservative value of \$12,000, though the actual cash outlay was less than half that figure.

The house was started about a year ago. It is located on the Buffalo Run Road on a two-acre plot which is a part of the family farm. The home is now practically completed, although there are a few jobs still to be done, such as grading, landscaping, and constructing porches and walks.

The whole undertaking was very systematically planned. Plans for the dwelling were purchased months before any work was done, and were studied thoroughly many winter evenings before they actually dug into the building part of the job. Spicer excavated the basement with a farm tractor and scoop, and called on both his farm

The Spicers today are living in their modern 7-room farm home (pictured above) which they built together in evenings and on holidays when both could spare time from their regular jobs.

Mr. and Mrs. Spicer hang a door in their home.

# BIG CASE TRACTOR

## ...Helps Solve Labor Shortage

**SAVES TIME  
SAVES FUEL  
SAVES UPKEEP**

Have you been behind in your work all summer because of wet fields, lack of power, not enough help? Get the jump on tomorrow's work *today* by making sure you'll have the lugging power and traction to push right through tough spots . . . the pulling power to whip big jobs fast . . . the extra speed that makes one man's time cover extra acres every day. See the fast 3-plow "DC" Case Tractor that's pulled many a farmer out of tight places—helped him stay ahead of his work. Get a demonstration. Drive it yourself.

You'll find it puts new pleasure and profit in farming.

### Ask for Demonstration of All This

#### **GREAT LUGGING POWER SAVES GEAR SHIFTING**

When throttled down, or slowed by a hard pull, the Case "DC" Engine does not falter. Instead, it pulls stronger—keeps right on going through many a tough spot where you would likely be stuck if you stopped. You save lots of gear shifting, lots of time and effort.

#### **SHOCK-PROOF STEERING SAVES HANDS, AVOIDS FATIGUE**

Case irreversible steering stops the jerks and jolts from rocks and rough ground. You don't fight the wheel to climb ridges and cross furrows. Case steering stays snug. Triple-life steering gear works in warm transmission oil, for easy action and constant lubrication without attention.

#### **"QUICK DODGE" GETS THE WEEDS SPARES THE CROPS**

Case front-mounted cultivator gangs are close to front wheels—they go where you steer, *when* you steer. Case Variable-Ratio Steering gives extra fast dodge when going ahead, extra leverage when making short turns. Four rows or two rows, you find it easy to cultivate close, clean and fast.

#### **WEIGHT BALANCED FOR SURE-FOOTED TRACTION**

Compact Case construction puts weight to work where it is needed—mainly on rear wheels when needed for traction with heavy drawbar loads, plenty on front wheels when wanted for quick, positive steering. Tires wear less, fuel goes further, work goes faster.

Model "DC" available also with single front wheel or adjustable front axle. Model "D" is regular 4-wheel type.

#### **FACTORY-BUILT TO BURN LP Gas**

As shown here, Model "DC" . . . like the mighty 4-5 plow Model "LA" . . . can now be ordered equipped for LP (butane-propane) fuels. Besides a full line of implements, there are 25 models of Case tractors. They include the big bargain in farm power and utility—the 2-plow "VA" Series with one-minute Eagle Hitch for Latch-On rear-mounted implements, and the larger 2-plow "S" Series.

Visitors won't find any milk cans in the milkhouse that is part of the pen stable exhibit at the New York State Fair in Syracuse. In the above picture, Harvey Alford checks the temperature of the milk which has traveled directly from the cow, through glass pipelines, into the tank.

## MILKHOUSE TANKS REDUCE LABOR

PERHAPS the greatest labor saving in the loose housing system for dairy animals occurs in the milk parlors built to fit the system. When cows are milked in elevated stalls, the squats and bends are eliminated; the use of a pipeline or combine milker does away with carrying milk from the cow to the milkhouse; and now farmers don't have to lift heavy cans in and out of coolers and onto trucks.

Refrigerated milk tanks have replaced 40-quart cans in the milkhouse which is part of the pen stable exhibit at the New York State Fair in Syracuse. Milk travels from the cow, through glass pipelines, to the tank, where it is quickly chilled and ready to be picked up by milk tank trucks.

Thus the milk is transported from the cow to the milk plant without the farmer carrying one ounce of it.

In 1949 a pen stable was erected at the State Fairgrounds to bring to the eyes of the farmer the advantages of the loose housing system. This year the milking parlor at the exhibit has been converted from a 2-cow to a 4-cow milking room with chute type stalls. The operator's pit is in the middle with 2 stalls on each side.

The exhibit demonstrates the method of reducing costs with simplified pole type construction. Farmers have built pole type barns such as that demonstrated at Syracuse for as low as 85¢ per square foot of floor area.—I.B.

## Calf Raising Hints

1. Every calf should remain with its mother at least 24 hours after birth to get that first milk (colostrum) which is vital to its future growth and well-being.

2. A good practice is to starve the calf for 12 to 24 hours after you are sure the calf has gotten this first milk, and then return it to its mother after the cow has been well milked out.

3. A calf should get about ten pounds of milk a day, not much more or less at any period, although this will vary some, depending upon the weight of the calf at birth. This is carried through by making available to the calf (not cow) good second cutting or fine hay and calf-prepared grains at all times; that is, calf pellets, calf grower ration, etc. As the calf grows, it will eat more and more of this ration and still come along fine on the ten pounds of milk per day. This milk is a must.

4. If the calf develops scours, tie it up for 24 hours and do not give it any feed or water. It would be advisable to call a veterinarian if the scours do not clear up soon. Much can be done for calf scours with present day methods and medicine. The first three weeks will about eliminate your calf-scur problem. Keeping the calf dry and out of drafts, with good sanitary procedures, will pay big dividends. If the calf is weak during any starving period, two raw eggs twice a day will give some nourishment. (Break the eggs and put them down the calf's throat in one operation.) Don't try to do this in your Sunday clothes until you have learned how!

5. Keep calves of approximately the same age together; separate them if there is over two or three weeks' difference in ages. Paragraph 4 is the main reason for this but not the only one.

6. Beware of buying 'bob-calves' from public markets. Buy from a

neighbor or from someone you know who has had the calf with its mother for at least two or three days. If you buy a calf which has been taken away from the cow too soon (without first milk), you are sure to have trouble.

7. You can increase the number of calves per cow so long as you allow ten pounds of milk per calf, and so long as the calves are approximately the same age and have calf hay and calf-prepared grains available at all times.

8. Your success will increase, or your failures decrease, if you can have separate and isolated pens scattered around the farm for each cow and the calves she is nursing.

9. Your first three weeks are really a problem if you are new at the game or have had bad luck buying calves that are over three weeks old.

10. There is a profitable field for this calf-raising operation without the work and the other necessary details that the good dairyman has to go through. Your big problem is obtaining the calves at the right age, when you want them or need them, and to have room enough to pen off each cow and her calves—preferably as far apart as possible.

—Doc Roberts

—A.A.—

## PACKAGING GROUND MEAT

Ken Warner, U.S.D.A. Meat Specialist, has passed us a tip on packaging ground meat. Place the meat in a square pan with sides about two inches high and level it off into a "cake" of pressed, ground meat. A large bake pan or cake tin could be used for this. Now turn the meat "cake" over onto a paper and cut it into the size packages you like. You can cut it into one or two pound cakes by measurement. The rectangular blocks are easy to wrap and identify for frozen storage.

—George H. Wellington

### THE ODDS WERE 6,400 TO 1

Leigh Babcock, Manager of the Dr. Philip D. Allen Farm in Otsego County, N. Y., is shown above holding the proud mother of triplet bull calves born on the farm in June. The dam is a registered Holstein, and was artificially bred. When the picture was taken the calves were one day old. The new arrivals boost the Allen herd to 35 head of Holsteins, of which 20 are milking. Triplets occur only once in every 6,400 births among cows.

### RABBIT FEEDING MADE EASY

COMMERCIAL rabbit breeder Adrian Rondeau, Middlesex County, Pepperell, Massachusetts, feeds two pens of rabbits at one time by cutting a round hole in the front of the hutch, and installing a simple wire basket on each side of the partition.

When it's feeding time, Rondeau stuffs each wire basket full of hay through the one circular opening. He

not only saves time, but the hay is kept clean and dry, and the rabbits may feed at any time.—C.L.S.

New York State's Dairy Queen, 17-year-old Beverly Prior of Sauquoit, N. Y., had her picture taken at the Stark Club with host Sherman Billingsley personally pouring her milk. Beverly was on a prize trip to New York City as guest of Dairymen's League Cooperative Ass'n., and the railroads.

### REMOVING STRAW SAVES CLOVER

Agronomists at the Maryland Experiment Station have made a close check on the number of red clover plants surviving under various seedling treatments. They have found that the stand of red clover plants has varied in much the same manner as yields have varied. As shown at right, for example, counts made in the spring on areas mowed

within one week after combining, with all straw and growth of clover seedlings removed, and followed by cutting for hay the latter part of August, averaged 9.4 plants per square foot. Similar areas which were not clipped and from which no straw and plant growth were removed averaged 4.5 plants per square foot, as shown at left. —Courtesy: The Furrow

# How to Control Cannibalism

**C**ANNIBALISM in chickens is a vicious habit of picking toes, combs, vents, feathers, and other parts of the body. Mortality can be high in many cases and a large amount of injury can be caused by the pullets picking the new succulent tail feathers as they develop. The attraction for the red color of freshly picked sections of the body, and the instinctive desire to imitate, largely account for the rapidity with which cannibalism spreads in a flock. The habit may be quickly acquired and when once well established defies control.

### Causes of Cannibalism

1. **Crowding:** Some form of cannibalism is sure to start when chicks or older birds do not have enough room. The desire to be the boss becomes more ferocious the smaller the space per bird. A warm stuffy brooder house is sure to start cannibalism among chicks.

2. **Inadequate eating or drinking space:** Chicks that have to crowd at the hoppers and fountains soon start some form of cannibalism. The eating and drinking space must be increased constantly with the growth of the birds.

3. **Idleness:** All-mash methods of feeding, trough feeding of grain, confinement rearing of birds tend to reduce the amount of exercise of the birds and increase the tendency toward cannibalism. Birds on a good roomy range seldom develop cannibalism.

4. **Floor laying and injured birds:** Many an outbreak of "pick outs" has its start when some bird lays on the floor. In the process of laying, the delicate membranes of the vent protrude. Its attractive appearance invites some nearby member of the flock to pick at it; blood flows and the chase is on until that individual is either disemboweled, rescued by the caretaker, or in rare instances escapes. But the attackers do not stop with that. Having become bloodthirsty, they continue their depredation—seeking out birds that may or may not be in the act of laying, and in a short time a cannibalistic habit has been established. Birds showing traces of blood on their feathers, either from injury to the flesh or from broken feather quills, should be promptly removed before the flock has any chance to practice on them.

5. **Insufficient and improperly constructed nests:** Nests are in most demand for just a few hours, and in high producing flocks there will be quite a rush for laying space during this time. If the birds have to await their turn for very long, they will bother those hens on the nests considerably, or lay on the floor. It is, therefore, essential to supply plenty of nests. They should be built so that the birds may be comfortable and unmolested while laying.

6. **Malnutrition:** Rations that are out of balance, that are too low in fiber, or that are lacking in vitamins, minerals and hard grit may lead to abnormal appetites and cannibalism. Experimental work indicates that cannibalism is more prevalent on rations containing a high percentage of yellow corn.

In the brooder house the chicks should have adequate ventilation, room, eating and drinking space. Provide enough space so that all the chicks can eat at the same time. Keep the chicks busy—deep litter might help; fresh-cut green feed might help. Keep chicks of different ages, breeds and sexes separate. Move pullets to range as soon as possible.

In the pullet flock, pullets in confinement should have every needed food element, plenty of fresh water in clean fountains, and enough room so they can get a little exercise.

If cannibalism has started among pullets before they go on range, immediate steps should be taken to con-

14th Neppco Exposition  
October 2, 3 and 4  
Pennsylvania Farm Show  
Building  
Harrisburg, Pa.

Control the vice in the range shelters. The birds should not be confined in the shelters too late in the morning. An automatic door opener will let them out early. On the range as inside—provide plenty of hopper and fountain space.

In the laying house keep only the best grade pullets that are healthy, vigorous and of good body weight.

Place pullets in the laying house before they start to lay. This will give them an opportunity to acquaint themselves with the location of the nests and other equipment before production starts. When pullets are first placed in the laying house, do not abruptly change them from their environment and feeding system to which they have been accustomed. Utilize the next four weeks as a gradual transition period. If the birds have been reared on range it is difficult to shut them up in close confinement in the laying house without having trouble from feather eating, vent picking and other forms of cannibalism.

After the birds have been housed for one day and are accustomed to their quarters, turn them into a sun yard or porch. This will enable them to secure some of the freedom to which they have been accustomed on the range, and will assist in preventing development of vicious habits of picking, which have caused such heavy losses in pullet flocks each fall. Discourage the laying of eggs on the floor by making the nests attractive and abundant. Provide 20 to 25 nests per hundred birds. Catch the birds that lay in the corners and put them in nests. Jump perches on the nests and feed hoppers should be high enough so that the birds on the floor cannot reach and pick at the exposed abdomens of birds standing on them. Nest perches should be far enough in front of the nests to prevent birds waiting their turn to lay from bothering those in the nests. Oil cloth curtains or shutout doors are also helpful in stopping this.

Remove "blowouts" before they become "pickouts."

### Other Control Measures

Bright light or sunlight makes the toes and blood-filled feathers more attractive to the chickens. Darkening the house to a point where the flock can barely see the feed troughs, water fountains will help some. The injured chicken or chickens may be daubed with one of the blood-colored distasteful ointments, or crank case oil or tar. To be effective, many chickens in the flock have to be painted in this manner, particularly in a severe outbreak. Mechanical devices such as vent protectors, pick guards, and specs are also somewhat useful in helping to control cannibalism.

The salt water treatment for cannibalism consists of adding 1 tablespoonful of salt to each gallon of drinking water for one forenoon. The salt water is emptied at noon and regular water is supplied during the afternoon. Three days later, repeat the treatment for another half day.

If it becomes necessary to debeak, an electric debeaker will do the best job. The beak should be removed at a line about half-way between the nostrils and the forward end of the beak.

— Anthony W. Sylstra, University of Massachusetts.

## BABCOCK'S HEALTHY CHICKS

### MAKE GREAT LAYERS

A the 1950 Storr's Conn. Egg Laying Test our White Leghorns won first all breeds, with 3899 eggs and 424.5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the all-time World's record for all breeds, all tests won in 1944-45.

**WE HATCH THE YEAR ROUND**  
White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks. We own two hatcheries with 600,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

# What Do YOU Think?

By JIM HALL

## More On Heifer Calves

**S**O YOU want to breed your cows to have all heifer calves?

Well, according to dozens of people in the Northeast who have written or talked to me in the past six weeks, it's a cinch!

The letters poured in as a result of an item in a July column requesting Mr. J. F. Goddard to get in touch with me to tell me his secret about always being sure of having cows produce heifer calves. He did phone me and I went out to get his method, but before I get into what he had to say, I want to point out that scientists and researchers, after many years of trials and tests, are unanimous in saying that only Nature has control of what the sex of a calf will be.

## Goddard Method

Here's what Mr. Goddard of Tompkins County, New York, had to tell me: "My system is very simple. Cows have two ovaries that I say are active in alternate heat periods. I contend that Mother Nature, in order to keep a balance between sexes, does it by having one of the ovaries govern male cells and the other female cells. With this knowledge, a dairyman who is very careful to watch heat periods can determine the sex of future calves in every instance, except for a heifer's first calf, and in unusual circumstances, such as a cow having twins or triplets.

"If a cow produces a bull calf, then she should be bred at the next heat period if you want her to have a heifer calf. If the cow produces a heifer calf, and you want her to have another, then skip one heat period before breeding her again. I followed this system in my herd for more than 20 years, and the only time it failed was when I had a young bull loose in the field with the cows and he wasn't as young as I thought."

## Contrary To Science

Now let me hasten to say right here that according to Dr. S. E. Smith of the Animal Husbandry Department at Cornell University and other scientists, those statements maintained by Mr. Goddard, and by lots of other farmers, are quite contrary to scientific knowledge. In the first place, says Dr. Smith, the activity of the ovaries does not alternate. They are active at random. Dr.

Smith also says it's positive knowledge that ovaries all have exactly the same X chromosomes, and for that reason the female has absolutely no part in deciding the sex of her offspring. He says it is the bull that produces two kinds of sperm, and that when the male X sperm meets up with the female X chromosome, then the calf will be a female; and when a male Y sperm meets up with the female X chromosome, then the calf will be a male.

Many of the people who wrote me about methods of breeding for heifers did not outline their system perhaps because they are interested in the suggestion in my column that such a system would be worth many dollars to lots of dairymen. Mrs. E. N. Spoor of Pittsfield, New Hampshire, says that a relative of hers who is a veterinary surgeon proved their system beyond a doubt, and Giuseppe Carbonera of Sussex, New Jersey, also says he has the answer.

## Tired Bull Theory

Another gentleman in Bristol, Vermont, writes that for 20 years his cows have had at least 75% heifer calves, and in many years 90% heifer calves. Martin Mather of Mayfield, New York, says that the last 7 calves out of his old bull were heifers and believes that it is not just an accident that he has such runs of heifer calves. Mr. Mather says he knows of no sure way to have all heifer calves, but says "If you keep the bull so that he is just a little lazy, and at the same time keep your cows in their very best possible physical condition, you will get a big majority of heifer calves; on the other hand, if you grain your bull and keep him in A-1 condition, you will get more bull calves."

W. R. Garlick of Camden, New Jersey, who has a small herd of registered Jerseys and breeds artificially, writes that he has bred 4 cows for heifers and that all of them have been heifers.

C. I. Reed of Walton, New York, says that under a system of breeding heifers he has made only one mistake in 7 years, and he can even explain what happened to mix that up. Mrs. Earl C. Lee of Harpursville, New York, says that her father's system yielded him 11 heifers out of 12 and that the method is still working for her and her brother's herd and for two other farmers whom they have gotten to try it.

Charles A. Wright of Lebanon, New Hampshire follows Goddard's method and says that it works, "even though some people may laugh at the idea." Rodney O. Clark of Williamson, New York, says that he has a system which he has followed for the last 14 years and during that time 9 out of 10 of his calves have been heifers.

Well, there you have it: Some theories that are absolutely contrary to scientific knowledge, which have worked out successfully in many herds. Would just "luck" give a man all heifer calves for 20 years? What do YOU think?

## DOWN THE

By J. F. "Doc" ROBERTS

**L**IVESTOCK prices, unlike egg or vegetable prices, more than double before the meat gets to the housewife. The average animal carries about half its weight in edible meat; in cows the average is less than this; in hogs, more.

Hides, fats, inedible greases, etc., have value as by-products but seldom a value of over half the live price. Hides and pelts, as well as fats and greases, have all dropped sharply in price within the last few weeks (shoes should be cheaper). This of course raises the cost of meat per bite and does not take into account any of the bone and fat sold with the meat. Live animal costs have dropped so that they more than offset the lower prices of by-products, and all meats are cheaper.

With the prevalent fad for boneless meats and prepared meats, with the average housewife demanding lean meat, the livestock producer is in a dilemma most of the time. Lean meat is not good meat, and, to meet price competition, prepared meats can only be made from the poorer animals or bulls. Therefore the livestock man cannot get his animals too fat (wasty), and yet if he doesn't get a good gain in weight from his feed, he is sure to lose money.

All these conditions you seldom hear mentioned when you hear criticisms of the cost of meat. Nor do you hear anything about the perishability of meats—the cost of keeping it under continued refrigeration, or the cost of state and government inspections, board of health rules, etc., all of which must be added to the price of meat.

### Can't "Hold Back"

Mostly, our livestock men are falsely accused of "holding back" animals for higher prices. For a number of years now, young, immature animals have been selling for more per pound than the mature animal would bring per pound; therefore, the farmer or feeder has had to keep his feed costs down, per pound of gain, and then get enough pounds of added weight to make up this difference in cost and at the same time pay his feed costs.

I have recently seen many examples of this, i.e., three-hundred-pound heifers bringing \$115 each—that is about 38¢ per lb., with market price on top dairy heifers for meat around 28¢ per lb. This is just as true of beef-bred feeding calves, feeding hogs or lambs. So again the farmer cannot market these animals when the public say they want them, for he must get a low costing gain on them which takes time—or go broke.

Right now the black marketeers have pretty well disappeared from our markets. Meat, as you have noticed, is available everywhere. Prices at retail should be lower and below Mike Di-Salle's ceilings, because livestock is lower and selling below the set ceilings or compliance prices. All this is because you advised Congress to remove from legal, long-established slaughterers the killing quotas which were set below their kill of a year ago.

I am hearing now that the "gang" in Washington is crying for the return of those limitations on legal packing houses. Can you figure why anyone would want to throw the meat and livestock industry back to black market operators and into shortages—the confusions and higher prices of a few weeks ago?

— A. A. —

One of the secrets of producing high quality hay is getting rid of the moisture in the hay as fast as possible and at the same time retain in the hay a bright green color.

# BEACON-FED HERD WINS NATIONAL CHAMPIONSHIP

Sets 1950 Production Record of  
14,095 lbs. M., M. E., in Ayrshire 15-25 Cow Division

## OWNER DESCRIBES FEEDING PROGRAM THAT WON CHAMPIONSHIP . . .

Fred Buell, Holcomb, N. Y., owner of the remarkable 15-cow Ayrshire herd that was first in 1950 and ranks second among U. S. all-time high Ayrshire herd averages regardless of size, believes strongly in adequate feeding for economical milk production.

"High quality hay is basic to successful dairy feeding," Mr. Buell asserts. Every effort is made to keep the herd on good pasture during the summer. Early cut grass silage and high quality hay are important factors in his roughage feeding.

### Beacon Feeds Sustain High Production

Mr. Buell's concentrate feeding plan makes good use of home grown grains in the Beacon Program. During the three years that the Buellay herd has been on the Beacon Dairy Feeding Program, the herd has increased steadily in production with a minimum of trouble at calving time.

### FRED BUELL'S DAIRY FEEDING PROGRAM

- 1 Calves started and grown on the Beacon Calf Feeding Program.
- 2 Heifers and dry cows fitted on Beacon Fitting Ration and freshened on Be-Co-Lass.
- 3 Fresh cows started on Be-Co-Lass and Fitting Ration and then put on milking ration as soon as possible depending on udder condition.
- 4 Cows milked on a 17% protein mixture of home grown grains and Beacon "32" Supplement.

For more information on the complete Beacon Dairy Feeding Program, see your Beacon dealer in states from Maine to Virginia and West Virginia inclusive. Or send for free copy of new 8th Edition of "Profitable Dairy Management" by Dr. Paul E. Newman, if you reside in the above states.

Visit the BEACON  
Booth New York  
State Fair in

# They're Growing Up!

—Photo: Harold M. Lambert

By

Edward V. Pope and Marion K. Stocker

*No. 1 in a series of articles on problems of teen-agers and how parents can help their children meet these problems. The authors are on the staff of the College of Home Economics at Cornell University.*

it's time to do the dishes.

What has become of your handsome, well-behaved children of yesterday? Those children have gone; and you had better make up your mind to it. Because they won't come back as they were. They have reached the stage of development known as adolescence.

Yes, they have changed, but there's something you can do about it. You can change, too. You can grow with them. Just as Mary and Johnny no longer are children but adolescents, so you no longer are the parents of children but the parents of adolescents. And you will need to adjust to your new role if you are to help, as you certainly want to, while your son and daughter are traveling the sometimes rocky path from childhood to maturity.

The physical and emotional changes of adolescence probably are the more disturbing because neither you nor your children have much control over them. Furthermore, the path from childhood to adolescence leads gradually out into the open, away from the protection of home. Therefore, any mistakes that Mary and Johnny make in tackling the rough spots are the more conspicuous—the more open to public censure.

For the most part, though, adolescence is a time of pleasant adventure and excitement; and, by your attitude, you can help to make it even more so. Think back to your own youth and remember some of those rough spots you encountered; then, perhaps, you will know when to tighten your guiding hand and when to loosen it. Watchful and sympathetic waiting is a good guidance principle to follow. Don't cross some bridges unless you must!

Lest you have forgotten, here are some of the adventures ("developmental tasks," modern psychologists call them) that your son and daughter will meet and need to master if they are to reach a well-balanced maturity:

1. Getting used to their changing physical appearance, even when it's different from the rest of the gang. (It's tough to be a head shorter than the other fellows—but if that's the way you're to be, you have to accept it.)
2. Learning what society expects from a young man or a young woman and to act accordingly.
3. Learning to be adults among adults.
4. Breaking away from emotional dependence on their parents and learning to meet what comes on their own two feet.
5. Looking ahead to economic independence, deciding on an occupation, and preparing for it.
6. Looking ahead to marriage and a family of their own.

Mary and Johnny may seem to ignore you as they meet these "adventures" and make their important decisions. But they need you all right, and they count on you—just as you count on the firm foundation of the house you live in.

And when they seem to forge ahead too rapidly and make mistakes, you can comfort yourself with this thought: What you have taught them in childhood—and apparently they have forgotten—isn't lost. The ideals you helped to instill in Mary and Johnny are still there, standing by them as they meet the hazards in the adventure of growing up.

**J**OHNNY, 14, is shooting up like a cornstalk in the August sun and he's likely to have unbecoming blemishes on his face. He's not so dependable and considerate as he used to be, either. Once he did chores around the house willingly; but now he bristles if you just mention that the furnace should be checked. And yet he wants to get an after-

school job at the local garage!

Mary, who is only two years younger, seems to be changing, too. Suddenly her appearance is her chief concern—Mary the tomboy who preferred dungarees to skirts and baseballs to dolls. Now she sits for what seems like hours in front of her mirror—with the door closed—brushing out pin curls and testing lipstick. She's never around when

## POTATOES Can Be Different

By KATHLEEN BERRESFORD

**W**E MAY get tired of peeling them, but we never weary of eating them. Boiled, baked, mashed and fried — potatoes, always potatoes. It wouldn't be dinner without them, would it? Our forefathers thrived on them, and so do we. Of course it's better if we don't peel them before cooking, because the jacket holds in the goodness so that it doesn't get lost in the cooking water.

Potatoes are rich in iron, vitamins and minerals. They are one of our most valuable foods—inexpensive, plentiful, and available the year round. But because we eat them nearly every day, and often twice a day, we need different ways to prepare them. Why don't you look through your cookbooks and see if you've forgotten some of the recipes you used to use? And here are

some reminders to start you off. You might like to try some of these for supper dishes.

### CHEESE POTATO PUFFS

4 cups seasoned, mashed potatoes  
1 cup grated American cheese  
2 teaspoons chopped onion  
Cereal flakes

Mix cheese and onion thoroughly with mashed potatoes. Make into balls, roll in cereal flakes and place in hot oven (400° F.) on a greased baking sheet. Bake 20 minutes. Makes 12 puffs.

### POTATOES A L'ITALIENNE

4 cups potatoes, sliced thinly  
1 cup canned tomatoes  
1 bud garlic, minced  
3 tablespoons parsley, minced  
½ cup olive oil  
Juice of 1 lemon

Arrange potatoes in a greased baking dish. Break up tomatoes and add

For variety  
serve a colorful  
platter of new potatoes  
and green beans with cheese sauce.

to these, garlic, parsley, olive oil, and lemon juice. Pour this over potatoes and bake in a moderate oven (350° F.) without covering until cooked through, about 45 minutes. Serves 6 to 8.

### HOT POTATO SALAD

¾ cup diced salt pork  
¼ cup vinegar  
¼ cup water  
1 medium sized onion, chopped  
1 quart cubed, cooked potatoes

Cook salt pork until crisp. Add vinegar, water, onion, and potatoes.

Season with salt and pepper and heat well. Serves 6.

### STUFFED POTATOES

Bake six potatoes. When done, cut a lengthwise slice off the top and scoop out the potato with a spoon. Mash; then add one tablespoon butter, salt and pepper to taste, one half cup milk, and two egg whites beaten stiff. Fill skins with this mixture, piling in lightly. Replace potatoes in hot oven and bake until they are puffed and brown. Grated

(Continued on Opposite Page)

(Continued from Opposite Page)

cheese may also be mixed with the mashed potato and sprinkled over the top before baking.

**POTATO CRUST**

Line baking dish with mashed potatoes. Fill center with vegetable stew and left-over bits of meat or fish. Cover with mashed potatoes. Bake in hot oven (400° F.) until hot through and brown on top. If you have just a little potato, make only upper crust.

**QUICK POTATO SOUP**

- 3 cups cubed potatoes
- 2 tablespoons onion, chopped
- 2 tablespoons fat
- 1½ cups boiling water
- 4 cups milk
- 1½ teaspoons salt
- Pepper

Cook the potatoes, onion, and fat in the water until the potatoes are tender. Add the milk, salt, and pepper. Heat and serve. Serves 6.

**FRANCONIA POTATOES**

Peel potatoes and parboil for 10 minutes. Drain well and place in pan in which meat is roasting. Baste at the same time meat is basted. Allow at least 40 minutes for potatoes to bake. They should be nicely browned. This method makes last-minute serving easier.

**NEW POTATOES AND GREEN BEANS WITH CHEESE SAUCE**

- 1½ lbs. green beans
- 2 lbs. small potatoes
- ½ cup butter
- ½ cup flour
- 2½ cups whole milk
- 6 oz. sharp cheese, grated (1½ cups)
- 1 teaspoon prepared mustard
- 1 teaspoon salt

Wash beans, remove ends; leave beans whole. Cook in boiling, salted

**New Wrinkle in Freezing Lima Beans**

EVERYBODY enjoys home frozen lima beans except the person who has to shell them—but North Dakota home economists have come up with an idea to lessen that difficulty. If the pods are softened by preheating in boiling water, the beans may be squeezed out of the pod, washed, sorted and packed for freezer storage. Beans prepared this way may be kept as long as those blanched in other ways, say the North Dakota specialists.

Here is how you do it:

1. Wash the pods in cold water.
2. Scald in boiling water, small beans 2½ minutes; large beans, 3 to 4 minutes.
3. Cool in ice water, then squeeze the beans out of the pods.
4. Sort out over-ripe or imperfect beans.
5. Wash beans in cold running water, drain, then package and freeze.

Beans fixed this way are not only much easier to prepare, but are said to score high in both color and flavor compared to those that are blanched after shelling.

water until tender. Scrape potatoes, and cook in boiling, salted water until tender. Melt butter in top of double boiler, blend in flour, and add milk; cook over direct heat, stirring constantly, until sauce boils and thickens; place over boiling water, add cheese and stir until cheese is melted. Add mustard and salt. Pour cheese sauce onto a warm platter and arrange potatoes and beans on it. Serves 6.

**SONG FOR AN APPLE PEDDLER**

By Edith Shaw Butler

Who will buy apples, ripe rosy apples,  
Apples to eat or to bake in a pie?  
Sample their goodness, savor their sweetness,  
McIntosh, Baldwin and Northern Spy.

Get them in bags or get them in baskets,  
A pound or a bushel, what do you say?  
Here is a bargain, so come now and purchase  
The blessing of Summer in apples today.

**GOOD ENTERTAINMENT AT STATE FAIR THEATER**

ONE-ACT plays to be presented by rural, city, and college groups at New York State Fair are as follows:

Sept. 3—"Cracked Ice" (Utica College Gaslighters) "Her Fatal Beauty" (General Electric Park Players).

Sept. 4—"A Quiet Home Wedding" (Excelsior Theater of Navarino) "The Farmer's Daughter" (East Clay Grange)

Procter & Gamble's Exciting, New

# CHEER

Specially made for  
"Tough-Job"  
Washing

There's never been  
anything like it!

Procter & Gamble's most exciting washday  
discovery in more than 100 years of soap making.  
New CHEER is specially made to do "tough-job"  
washing better than any kind of soap!

Try it on your  
dirtiest clothes!

See how toughest washing jobs come cleaner in  
hardest water! When you see how CHEER suds out  
even greasiest, ground-in dirt, you'll see why new  
CHEER gets all your wash so beautifully clean!

Here's the secret!

New patented formula makes CHEER different!  
CHEER is specially made with the extra power  
you need for your extra-tough washing jobs!

Safe for colors, too!

With all its "tough-job" washing power, new CHEER  
is safe for colored washables, kind to hands!

Prove it next washday

New CHEER does tough washing jobs better—gets  
clothes cleaner, whiter in hardest water—than  
any kind of soap you've ever used! TRY IT!

Keep Cheer on hand! Get the Giant Economy Size package.

# Cut Hours from Your Sewing Time

By MABEL HEBEL

**M**Y FRIEND Mary makes all of her daughter's clothes, including tailored wool suits. When I stopped in to see her last month, she showed me several garments that she had made this year—a bridesmaid's gown; a white organdy dress for her daughter's graduation from high school last June; a checked wool suit; a brown silk faille dressmaker suit, and a taffeta evening gown.

They were all so stunning and so perfectly made that if she had told me they came from Paris, I would have believed her. My surprise was great, therefore, when she remarked that she would like to take a course in dressmaking—but she added that what she wanted was a course in shortcuts in sewing, so that she wouldn't have to spend such long hours in making a garment.

The day I called on Mary she was trying to make a white linen dress in a hurry for her daughter to wear to a dance the following night. For once, she was sacrificing perfection to speed, but she wasn't too happy about it.

Shortcuts in sewing and satisfaction can go together, however, according to students who learned easier methods of clothing construction at the New York State College of Home Economics at

Cornell this past summer. Many of them were teachers of sewing in grade and high schools, but they were looking for quicker, easier ways. They found them, and learned to make an attractive dress in from 4 to 6 hours, including cutting time. The girls say anyone can do it if they follow these four basic rules:

1. Select an easy pattern with few pieces. Choose simple styles with plain necklines; cap or kimono or no sleeves; tie fasteners or openings that will take

Shortcuts in dressmaking, learned in a clothing course at the College of Home Economics at Cornell, enabled these three students to make in from 4 to 6 hours, including cutting time, the pretty dresses they are wearing. One time-saver was the stitching of hems, done in such a way as to show very little from the right side of the dress.

dot or grip snappers. (Difficult features for beginners are set-in sleeves, collars, facings, and buttonholes.)

2. Assemble equipment so it's handy. Fasten pattern instruction sheet to sewing machine or work table with scotch or masking tape. Then you won't waste time looking for it when you need it.

3. Look for shortcuts. To transfer pattern markings from pattern pieces to the cloth, insert dressmaker's carbon between the two cut layers of cloth and trace the outline of darts and seams with a tracing wheel. Use bits of masking tape instead of pins and bastings to hold zippers and hems in place for stitching. You can also place masking tape along seam lines as a guide to straight sewing.

Make boleros and halters double to eliminate facings and difficult stitching. Some of the girls used contrasting materials, such as plaid and plain red for their reversible halters or boleros. The garment can then be worn either side.

In many of the outfits made at the College, machine stitching took the place of hand sewing wherever possible. Hems were stitched, but in such a way as to show little from the right side of the dress. The method applied was the same as that of the machine attachment for skirt hems; that is, the top of the hem was stitched close to the edge and every eighth stitch or so was caught in the dress.

4. Use assembly line methods. Why should men have a monopoly on them? Sew as many darts and seams as practicable at one sitting—making sure not to stitch over an unpressed seam. Then do all the necessary pressing. Again, stitch as much as practicable.

You may already be using some of these shortcuts, but if not, why not try them out? Your sewing methods may be all the better for a little streamlining.

**No. 2345.** In this seasonless shirt-waist dress, interest lies in the new collar and cuff detail, buttons to hip length. Short-sleeve version is included. Sizes 12-20, 36-44. Size 18, 4 3/8 yds. 39-in.

**No. 2480.** For many occasions, make this shutter-neckline casual with soft touches—a deep back pleat for extra ease, and pushup sleeve cut-in-one with bodice. Sizes 10-20, 36-40. Size 16, 4 1/2 yds. 39-in.

**No. 2483.** One pattern makes three mix-match separates — money-savers, wardrobe stretchers! Sizes 10-20. Size 16 skirt, 1 1/2 yds. 54-in. High neck weskit, 1 yd. 54-in. V-neck weskit, 1 1/2 yds. 54-in.

**No. 2522.** Versatile V-neck jumper—to wear as a dress minus the classic casual blouse! Very simple to sew, too. Sizes 10-20. Size 16, 2 yds. 54-in. for the jumper. The blouse, 2 1/2 yds. 39-in.

**TO ORDER:** Write name, address, pattern size and number clearly. Enclose 25 cents for each pattern wanted. Add 25 cents for our Fall-Winter Fashion Book which has attractive designs for all ages, sizes and occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

# WHAT'S GONE BEFORE

When the news comes to Jenkstown of the death of Mark Wilson in the Battle of Fredericksburg, his young wife, Ann Clinton, becomes so indifferent to everything that she allows herself to be persuaded by her mother to marry Henry Bain, a neighboring farmer who holds the mortgage on the Clinton farm. Bain is a Copperhead, but with the change in the war news, he changes his sympathies to the winning side. Charlie Wilson, Mark's younger brother, is with the cavalry, and takes part in the battles of the Wilderness and Early's raid of the Shenandoah Valley. At home, Ann and her mother get word of her father's death in the Battle of Cold Harbor.

## CHAPTER XXVI

After the Shenandoah Valley campaign, Sheridan's cavalry helped Grant and Meade in their campaign to take Petersburg and Richmond.

Riding almost constantly with the cavalry to destroy railroads and intercept supplies for the Confederates in and around Richmond, Charlie lived on hope that the war would soon be over.

And there were signs that this hope was justified. No matter how brave the veteran Confederate Army was, no matter how skilful Lee and his generals, there were limits to what human beings could take, and the Confederates were fast approaching those limits. The soldiers were almost starving, their uniforms were in rags, many of them were barefoot. Hundreds were sick. Lee knew that the end was approaching.

On the fourth of March, thousands of soldiers and the millions on the home front read Lincoln's second inaugural address. It was not pleasing to those who hated with bitter intensity the South and all of its works, but to the soldiers who had actually done the fighting, to George and Charlie Wilson and to Ann and Nancy, Lincoln's words struck a responsive chord in their hearts when they read:

"Fondly do we hope, fervently do we pray that the mighty scourge of war may speedily pass away. With malice toward none, with charity for all, with firmness in the right as God gives us to see the right, let us press on to finish the work we are in, to bind up the nation's wounds, to care for him who shall have borne the battle and for his widow and orphan, to do all which may achieve and cherish a just and lasting peace among ourselves and with all nations."

Yes, there were many who knew and appreciated the wisdom and the charity of those words and the great man who uttered them.

The inaugural address was given on March 4, 1865. On April 2, Grant and Meade assaulted Petersburg and captured it, forcing Lee to abandon both Petersburg and Richmond. Charlie never forgot the awesome spectacle of a city on fire when he entered the Southern capital with the Union forces, to find that the retreating Confederates had tried to burn their own city. The first job of the Union troops was to save it from destruction. Seven days later, on April 9, General Robert E. Lee surrendered his Army to Grant at a house owned by a man named McLean at Appomattox Court House. The ceremonies were simple and soon over.

Lee was told that his forces must lay down their arms and pledge themselves to obey the laws of the United States. Grant allowed the men to keep their personal property and their horses "to work their little farms."

When the terms were signed, the proud Lee stood erect, his face drawn with suffering, and said:

"General Grant, I have one request. My men are starving—"

Without waiting for him to finish, Grant said:

"Sir, rations will be provided immediately"—and they were.

As the news spread and reached the waiting armies, a great cheer was started by the Federals, only to die out in complete silence almost before it was born. There was something infinitely sad about the end of such a conflict and the defeat of men who had fought so valiantly for a lost cause, a sadness that was sensed and felt even by the soldiers who had won.

To Nancy and all the other mothers and wives, and to the soldiers themselves, almost the hardest part of the whole war was what seemed to them the unnecessary delay after Lee's surrender, in mustering the men out of the Army so that they could go home again. Letters to Nancy from George and Charlie told of forced hard marches from Richmond to Arlington, near Washington, and then, after all the hurry, of sitting down to wait a long time to be released. With discipline re-

laxed, there were constant brawls among the men, particularly between the soldiers of the Army of the West and those in the Army of the Potomac. Each claimed all credit for winning the war, and they were willing to fight to prove their point.

One relief from the long wait was the Grand Review of all the Union forces on Pennsylvania Avenue in Washington. Proudly George Wilson led his band ahead of his brigade, proudly Charlie Wilson rode in that great parade, with thousands looking on and cheering. Even Rienzi and the other prancing, dancing horses seemed to know that the war was over. Only four years before, most of those marching men had been, like Charlie Wilson, just beardless boys, mostly farm boys. Now, after four years of the shouting and tumult of war, they had left boyhood far behind. They were veterans, many of them skin poor, eyes sunken, their tanned and weatherbeaten faces almost black from constant exposure to the southern sun and wind. But they were hard as nails, and if they remembered their comrades who no longer marched or rode with them, if any were saddened because their great President was not there to greet them, it did not show in their jaunty, springy step or their erect soldierly bearing. The past was gone beyond recall, the war was won, and they had helped to win it. The most important thing now was that they were going home.

It was a great moment for Charlie, and the climax of all that had gone before. Great was the rejoicing in the Wilson home when they arrived. As they all sat down to supper that night, Nancy's heart would have overflowed with joy and thankfulness, had it not been for Mark's vacant chair. The war was over at last, but Mark, her first-born, was dead and would never come home again.

On a bright summer morning in 1865 Ann Bain, who had been Ann Wilson, and before that Ann Clinton, stood looking from her kitchen window across the fields that led to a bend in the road toward Jenkstown. Ann often stood in that window watching the

road, though why she could not have said; she didn't even realize that she had developed the habit. This morning, as she stared at the road, she saw a man come around the bend of the road and into view. He was walking very slowly and with a limp. Something familiar about that solitary figure set Ann's heart to pounding. Who could it be? Surely someone she had known.

Then, suddenly, as he drew nearer, she knew! Even though the man seemed almost old, with unkempt hair, long beard and limping slow footsteps, she knew that it was Mark. As recognition became a certainty, she pressed a hand to her heart and sank almost fainting to a chair, but never taking her eyes off that slow-moving figure which kept coming toward her.

As she watched, he crossed the yard, climbed the porch steps, and slowly, so slowly, opened the door without knocking, and called in a deep, hollow voice:

"Ann, my Ann! Where are you?"

The girl came slowly to her feet to face him, bewildered, horrified.

"But you're dead," she cried. "You're dead!"

He grinned wryly:

"No, I'm not, dear. Almost, I admit, but not quite."

Opening his arms he stepped toward her, but she threw up her hands, palms out, and as he advanced she moved backwards.

"No, oh no!" she cried, in anguish.

He stopped.

"Don't you know me, Ann? It's Mark, your husband. What's the matter?" he asked.

"I—I thought you were dead!"

"But I'm not," he insisted. "I'm alive. I'm here."

"Where have you been?" she gasped. "You were reported dead. A memorial service was held here for you."

"I was wounded and captured, and I've been in Andersonville, where men died like flies. But I didn't die." He paused. "They couldn't kill me because I had you to come back to."

"We had no word. All these years we had no word," she moaned.

Not understanding but still patient, he said:

"There was no way of getting word to you. You have no idea of the horrors at Andersonville. No one could write, no one received any mail. We lived in holes in the ground, like hogs. But I'm here, Ann darling. I'm here. I know I look terrible, but I'll get over that."

Sympathy flooded her heart:

"Of course you'll get over it. But what am I to do? What am I to do?"

Bewildered in turn, he said:

"Do? Why, our troubles are over, Ann, dear. I'm home again. Nothing else counts."

Again he started toward her and again she put up her hands to ward him off. Then she took him by the arm, even in her mental stress thinking how poor that arm was, nothing but skin and bone. She led him to a chair, and seated herself in one on the other side of the table, saying:

"Mark, let me explain. Listen, and tell me what to do."

More bewildered every minute, he sat staring at her with his deep-sunken eyes.

"What's happened? Tell me?"

"We had official notice from the Adjutant-General's office that you had been killed in action. Funeral services were preached here in Jenkstown for you. I thought you were dead, Mark; I thought you were dead, and I wished I was dead, too."

"But I'm not dead." He grinned a little. "Why so serious? I'm here, and we're together again."

She shook her head.

"How can I ever tell you, Mark? Pray God that you will understand. A long time after the memorial services, Mother and I were having a difficult time to get along. I couldn't continue

(Continued on Opposite Page)

## SLIM & SPUD

## Shocking News

## NO DRUMS

(Continued from Opposite Page)

to work the farm, and Mother was worried and fretting. Besides, I thought you were dead and nothing else mattered. I cared about nothing in the world. So—"she hesitated—"to help Mother keep her home, to have a home for father when he returned—" a sob choked her—"he's dead, you know, killed at Cold Harbor."

When she could control herself, she continued, speaking slowly and painfully:

"So—I married again!"

The man across the table from her looked at her with incredulous eyes.

"Married again? My God! You married again, Ann! Who? Who was it?"

Then he answered his own question: "Henry Bain!"

She nodded silently.

"And I didn't know! I was so eager to get home to you that I stopped to talk to no one! I didn't even go home!" He swallowed. "Home? Home? I haven't any home."

Slowly he pulled himself to his feet, turned to take a long look at the crushed girl now weeping with her head on her arms on the table, then slowly limped out of the door and down the steps and up the road to the Wilson farm.

To Nancy the coming of Mark was almost as much of a shock as it would have been had he actually risen from the dead. He looked so ill and changed that the first thing she did was to get his clothes off and put him to bed. Her questions as to what had happened to him were answered almost in monosyllables, or not at all. Without asking, she knew that he had seen Ann.

From then on Nancy kept him perfectly quiet, but he wouldn't eat, and she knew that he didn't sleep. Finally she had Dr. Barr come to see him, and when the doctor came down from the upstairs bedroom after giving Mark a careful examination, his face was very serious.

"This young man has had an experience that few survive," he said, gravely. "On top of that we know, without discussing the matter, what a shock he had in learning that his wife had remarried. I want to be honest with you. His very reason is in danger. I have given him something to make him sleep, and I'll come again tomorrow. Keep him quiet."

Henry Bain returned to the Clinton homestead that evening to learn from Ann's lips of Mark's return. He had stopped at the post office on his way home and wondered at the quick cessation of conversation when he had entered the store and the peculiar looks he had received. But he was used to his unpopularity now and didn't think much about it, although he had hoped that the situation was improving. When Ann told him the news, he only said:

"We can fix this up. You can get a divorce from Wilson."

Mrs. Clinton, who was listening to the conversation, nodded her head.

"Yes, that's the thing to do!" she cried.

Ann turned to look at her.

"Mother," she said, coolly, "from now on you keep out of this. I don't know how we can settle this, but whatever the decision I propose to make it myself."

With an injured air, Mrs. Clinton rose and slowly went out of the room. When she had gone, Henry continued:

"I'll move out for a while, and you can get the divorce. Surely you want nothing more to do with this ne'er-do-well who has been alive all this time and never let you have a word from him!"

Ann sat for a long moment looking steadily at him, and then she said:

"Henry, I'm neither wise nor good. If I had been good, I never would have married you without love. And it's no

excuse that I did it because I thought Mark was dead and because I thought it would make my mother and father happier. I told you when I married you—God forgive me—that I didn't love you. I've tried as hard as I could to be a good wife. I thought that maybe in time we could at least live together in peace with some contentment."

She paused for a moment, and then, sitting straight in her chair and pointing her finger at him, she said, passionately:

"But no man and woman can live together in the intimacy of marriage without knowing full well the real character of the other, and I know you, Henry Bain! I'm not talking about faults such as we all have. I'm talking about the principles that you don't have, never have had, and never will have. I've tried to see some sincerity in your apparent change of heart in the past year, but I know there's no real change. You made believe that you favored the Union cause, and that you were no longer a Copperhead only because you were just plain scared. You're a coward! I've known this in my heart for a long long time, but I was your wife, and my idea of marriage is to keep the faith even if the other fellow doesn't. Now I no longer have to. I have no hope in the world that Mark Wilson, the man whose memory I revered, the man I loved and still love, will ever look at me again, and for that I cannot blame him; but at least I don't have to go on living with you."

Jumping to his feet, Bain said, hotly:

"You've had your little say. Now you listen to me. I married you chiefly to give me some standing in this part of the county—although little good that did me. I've taken this poor old rocky farm, put stock on it, fertilized and seeded it, made something of it, and given you and your mother a home. And this is the thanks I get!"

"But I'll tell you one thing, young lady. No one gets very far ahead of Henry Bain! Need I remind you that when I married you I held the mortgage on this farm? And you haven't paid a cent on the mortgage or the interest since. Don't look for any generosity from me so far as this property is concerned. You're not going to be able to turn around and give it to Wilson, who no doubt was glad to save his hide in a Confederate prison in order to keep out of the battles."

"That will be enough, Henry," Ann said, calmly. "If I had followed Mark Wilson's advice in the first place and let you take this farm, how much better off we all would have been than we are now. You're so wrong in your whole attitude toward people and toward life that I actually feel sorry for you. You'll never be a happy man. Mother and I will move out of here just as soon as we can find another place to go. And now, Henry, I'll say goodnight and goodby."

(To be continued)

— A. A. —

## WHAT DO YOU THINK ?

(Continued from Page 21)

tor, E. R. Eastman, and E. H. Bakken, National Director of Rural Scouting, is one borrowed from the Ithaca Journal. I'm printing it because I think thousands of Ed's friends in the Northeast would like to know about another of his many activities to promote better rural education, better rural living and an agriculture of plenty to help keep America strong and free.

The picture was taken at a recent ceremony at Ithaca in which Editor Eastman was presented a Boy Scout statuette in recognition of 25 years of service on the National Rural Scouting Committee. He helped initiate the first meeting of the committee and is one of only three men who has served on the committee since its creation in 1926. In accepting his commendation, Editor Eastman said that today we must make a greater effort than ever in the guidance of youth.

## AT HAYFIELDS

By TOM MILLIMAN

### FERTILIZER SPREADING

**O**N JULY 24, while Hayfields' men were rushing in the last of the first-cutting hay in this delayed season, and 45 acres of wheat awaited combining, there was no time and no energy for spreading fertilizer. Yet 0-19-19 fertilizer with borax was required on 18 acres of second-cutting alfalfa, 10 acres of birdsfoot-timothy aftermath, a 4-acre patch of birdsfoot pasture and about 4 acres of ladino-brome calf pasture. The need was met by phoning for a 7½ ton load of 0-19-19 fertilizer to be spread on these fields at the minimum rate of 400 lbs. to the acre.

The truck arrived at 9:00 a.m. with only one man aboard, did a good job of uniform spreading on the 36 acres, and was gone shortly after noon. At Hayfields the only effort required was to point out the fields. Cost was 50c an acre or \$2.50 a ton higher than the price of the same fertilizer in paper bags at the nearest dealers. At a higher rate per acre the extra cost per ton goes down.

The same rig came again in early August, when another 40 acres of mixed legume pastures and hayfields, also some alfalfa in wheat stubble, were treated with 0-19-19 at the rate of exactly 400 lbs. This time it took the full 8-ton capacity of the truck-spreader to cover 40 acres.

For \$38 over the regular price of the fertilizer in bags, 76 acres were treated at approximately the right time. Without the spreading service we would have been hard put to apply any of it with our own labor until after oat harvest, and probably the last of this disagreeable job would not have been shoved behind us until November. As it is, much avoidable labor has been saved, while the legumes in 7 fields received the benefit of potash, phosphorus and boron in time to make more crop this season and strengthen roots for the winter.

### Is It Practical?

Even so, 15½ tons of 0-19-19 fertilizer costs a lot of money. Couldn't we have skipped it this year? The answer is, yes of course we might have omitted this annual treatment of grasslands containing legumes. Another view is that on a farm operation where all labor is hired, many privileges extended, and profit sharing practiced, we cannot afford low yields of pastures, hayfields, cultivated crops and cows. Under our conditions, low yields cost too much. Fertilizer is the cheapest commodity we can buy, whether it is measured at present price level, the old dollar now gone, or in terms of crop results, longer lasting legumes, and soil conservation.

Getting it spread so cheaply makes the whole outlook all the more attractive. The big truck-spreaders are increasing in numbers, and several com-

peting firms and their dealers now offer the service.

Are we crazy, or is this thing sound? Opinions are invited.

### HERD AVERAGE—MILK AND FAT

The following figures were compiled for the calendar year 1950 by the American Dairy Cattle Club, with which Hayfields has been affiliated for 14 years. In order that first lactations may be fairly compared with the production of mature cows, the standard age correction table of U. S. Department of Agriculture was used and all lactations are on a 305-day twice-a-day milking mature equivalent basis:

	Cows	Average Lbs. Milk	Average Lbs. B.F.
1945	27	8017	373
1946	29	9142	426
1947	30	9330	425
1948	35	10453	467
1949	30	10308	466
1950	31	11494	523

Although we milked more than 31 cows in 1950, the presence of two-year-olds starting with less than 305 days remaining in the calendar year resulted in only 31 lactations being completed by the end of the year. The stable has been extended to accommodate oncoming heifers, and we now have 46 stanchions; all of which are filled.

In 1950, of the 11 first-lactation heifers which had milked 305 days, 7 were above herd average and 4 were below it. Of the 20 cows with two or more records, 13 were above herd average and 7 fell below it. The variations were not sharp, which means we have no really great or really poor cows.

### The Background

The Hayfields' herd was founded in 1925 by buying a few registered and grade Guernseys, and it was a straight Guernsey herd for a dozen years. Then we began to crossbreed a little and waited for the results. The moderately higher production and greater size and stamina of the crossbreds seemed to warrant expansion in that direction. Today all except three of the milking cattle are crossbreds. They and more than 40 heifers of varying ages are all either red and white or solid red animals. The crossbred herd has not yet been culled either among the milking cows or the heifers. Lack of barn room will require some eliminations early in the coming winter, and near neighbors have spoken for the surplus animals.

In 1951, butterfat percentage is a little lower and milk flow quite a bit higher. If the herd maintains the pace of the first 8 months of the year, a moderately higher milk yield and a slightly higher total fat yield should be accomplished.

Moderate grain feeding and heavy roughage feeding are the rule in the winter. Of the grain fed, two-thirds is raised on the farm and taken to the feed store to be ground and combined with purchased items. We strive to

Here's a rig with 8 ton capacity, destined to do great work for Northeastern farmers. It is a one man bulk lime and fertilizer spreader for custom service, geared to apply as little as 300 lbs. and as much as 5,000 lbs. to the acre, and do it rapidly. Its development has taken more than 15 years. The price of this 10-wheeled job is about \$9,500. It has power on 8 wheels and an auxiliary engine for the conveyor and spreader. Hiring it is practical for any farmer because of the saving in bags.

maintain the protein level of the grain ration at about 16%.

In summer and fall we try hard—and yet fail to provide completely really good pasture every single day. In this generally favorable pasture season, we have had rather good success (at least up until August 1); still we must admit to four or five short spaces of time in which grazing was not quite good enough and milk production fell off temporarily, and sometimes in three days of decline dropped as much as 10%.

Whenever this happens, the recovery, although rapid, never quite comes back to the level it was at start of decline, thus causing a gradual lowering of production as the summer advances.

### ALEX CAMERON

Some weeks ago I was asked to sign a form authorizing the Dairymen's League to deduct 24c a cwt. for milk hauling and pay a new hauler to replace Alex Cameron, who desires to retire. Our milk is trucked some 15 miles to a retail bottling establishment in Rochester.

For 26 years and 5 months, 7 mornings a week, through snow, ice, blizzards, rain and heat, our milk has been faithfully hauled by Alex Cameron. He never missed a morning in all those years, and for a considerable period before that. In late years, Alex has had an employee do the job for him much of the time. A farmer himself, he knows how important daily delivery is to the consumer, the milk plant, and not least, the producer.

To be sure, Alex Cameron was paid for his service and presumably made a profit. It would be regrettable to learn that such long and faithful service was not accompanied by a net gain.

This note is written in behalf of the many hundreds of Alex Camerons who render 365-day service in moving milk toward consumers in this great Northeastern milkshed. The unrelenting demand upon them to get the milk through every day regardless of roads and weather, approaches, and sometimes during storms surpasses, the requirement of the dairyman and his workers to be on hand to milk, clean stables, and feed twice or three times a day every day.

Farming is served by many people who go unrecognized and who are supposed to take their pay and be satisfied. They are as human as any. Some of us are forgetful, as can be observed from the fact that this is the first time in 26 years that I ever thanked Alex Cameron for what he did. Hereafter from time to time I shall take note of individuals who serve either on their own as private enterprisers or as employees of firms or cooperatives. We live in a

complex world. It is men and women who make it go.

### CHAFF

When searching for the best place in which to set strawberry plants for home or market, consider newly cleared land, particularly that upon which cut-over brush has rotted down instead of being burned off. Notional? A large-scale Northeastern grower is now doing that very thing at the rate of more than 50 acres a year. He says that nowhere else can he produce strawberries of such superlative size, yield and quality. Dependence can be had on such land for five or more replantings.

\* \* \*

Tiger lilies growing in the dooryards of long vanished houses, amidst the competition of weeds, of grass and of brush, and surveying vigorously in spite of total neglect by man, are refreshing evidence of the desire for beauty on the part of families of another time, whose lives were lived without the aid of any of our modern conveniences. How fortunate for us that in the effort to surround their homes with pleasant things one of their choices was tiger lilies. This persistent flower of gorgeous beauty proved to be more enduring than houses, and perhaps other possessions left to heirs.

\* \* \*

Man-made farm ponds have shown heartening increase in our good Northeast these last few years. Even so, observation when traveling would lead to the conclusion that Kentucky and the Southern half of Indiana are still far ahead of us. Farm ponds are practical and, of equal importance, recreational. The pond that yields fire protection, livestock watering and irrigation, also provides swimming, skating, fishing, and a place for children's rafts.

\* \* \*

One need for farm ponds, though, has almost completely disappeared. No longer do we put up ice for milk cooling and household use. It's too bad that an earlier and ice-dependent generation could not have had the convenience of more nearby farm ponds for harvesting ice. Some of us still active in farming remember team hauling loads of ice over the roads in bitter weather, sometimes by sleighs and at other times by wagon.

\* \* \*

Large trees are not the only sign of fertile land recognizable from afar. Big weeds are another. It takes good land to produce a whopping crop of weeds. No longer do we need be afraid of land foul with weeds, with our power cultivators, chemical and hormone weed sprays, and fertilizer to make the planted crop get ahead of the unplanted.

## Prompt Action Nets Reader \$25 Reward

CHARLES McCULLOUGH of Brockport, N. Y., is a man of action. He doesn't believe in sitting back and waiting for developments. One morning several months ago he went to the barn to milk and discovered that two heifers were missing. The back door of the barn was open, and he followed tracks he found running across the field to the road.

Mr. McCullough called the State Police and reported the incident, but he did not wait for the police to do all the work. Instead, he went to the Pavilion Auction. At about 4:00 p.m. he spotted one of the heifers and stopped the sale. The Sheriff was called, and he got the name of the man who brought the animal to the sale. The thief was caught that same evening. The other heifer was found hidden in an old barn. Though Mr. McCullough got his heifers back, one became ill as a result of the episode and died.

The culprit, William May, had also stolen a heifer at Albion. He was put in jail at Batavia to await the Grand Jury. In all, he spent about eight months in jail, but was eventually given a suspended sentence and placed on probation for two to four years.

AMERICAN AGRICULTURIST feels that Mr. McCullough really earned the \$25 reward check being sent him for his personal efforts in tracking down the thief. Our congratulations go to him and to the authorities for promptly bringing to justice this cattle thief.

Just recently, since the McCullough theft, AMERICAN AGRICULTURIST increased the reward offer to \$100 in an effort to put a stop to the sudden increase in cattle rustling. This \$100 offer will stand until December 31, 1951. Remember—promptness in reporting thefts to the authorities and a little special effort on your part to help track down and jail the thieves may result in your getting a check through the mail one of these days.

In order to be eligible for the cattle theft reward, the animal or animals must be stolen from an AMERICAN AGRICULTURIST subscriber who has a Service Bureau sign posted on his property; application must be made not later than date of conviction, and the guilty person or persons must actually spend at least thirty days in jail as a result of evidence given by the applicant for the reward.

### ORDER WITH CONFIDENCE

All advertisements that appear in AMERICAN AGRICULTURIST are guaranteed. Here is how guaranteed advertising works to serve you:

Every new advertisement is carefully checked by the Service Bureau to see that the company is reliable and that it will do as it agrees. Any doubtful ads are rejected.

If a check or money order is sent to an advertiser by a subscriber and the goods ordered are not received, we guarantee that the money will be refunded. Do not send loose change or bills through the mail.

If the merchandise received is not as

represented, it can be returned for a refund. Any unsatisfactory goods should be returned within the trial period when so specified in the advertisement; or, if no trial period is mentioned, the merchandise should be returned as soon as it is received and found to be unsatisfactory. With returned livestock, it is common practice for the customer to pay transportation charges one way.

Complaints of unsatisfactory dealings with advertisers should be made promptly; and in order to take advantage of our guarantee of ads, you should mention when ordering that you saw the advertisement in AMERICAN AGRICULTURIST.

Most advertisers are absolutely reliable. Every effort is made by the Service Bureau to exclude the few that are otherwise. In the few rare cases where one of our advertisers does not live up to the standards we set, we cancel the advertisement immediately.

## INJURED ON WAY TO STATE FAIR

MERRILL FICK  
Altamont, N. Y.

Just outside the New York State Fair main gate last year the car in which Mr. Fick was riding was rammed from behind. The sudden jolt snapped Mr. Fick's neck—he then was thrown against the windshield. Later the doctors found he had torn the ligaments and nerves in his neck.

For weeks Mr. Fick was in misery. He drew the full amount of weekly benefits from his North American Travel Accident Policy which amounted to \$130.00—more than three times what he paid to carry the policy for eighteen years.

### MR. FICK SAYS:

"The North American Accident policy is a wonderful thing. I've carried my policy for eighteen years and never used it until this accident.

"I don't see how any working man can get along without insurance. It was unbelievable how easy I got my benefits, there was no fuss or bother. All I did was fill out the forms and the next thing I had my check for \$130.00."

HERE IT IS... in a class by itself

...the new  
**FERGUSON "30"**

Heavy-duty wheel equipment available at extra cost.

**YEARS AHEAD IN  
ENGINEERING**

with a great new valve-in-head engine  
You get 20% more engine power... a tremendous increase in lugging power... valve rotators... and other refinements.

with semi-spherical combustion chambers  
You get improved ignition, more complete combustion, less carbon formation, superior performance with a wide range of fuels.

with an amazing new air-fuel system  
You get a cleaner, cooler air-fuel mixture that prolongs engine life.

with the one and only Ferguson System  
A greatly improved hydraulic system makes it better than ever.

Look at it. Get that feeling of size and power... weight and traction. Then consider this fact...

... here is a tractor that has been built in perfect balance to meet more of your needs, more of the time, than any other tractor.

It has abundant power... all you need for most three-bottom plowing. It has flexibility and compactness for doing many jobs quickly, at low cost. It has the one and only Ferguson System.

And it has the greatest torque (lugging) characteristic of any tractor ever built. Peak lugging power is developed at low engine speeds to keep you moving when heavy going slows you down.

Scores of new features have been engineered into the new Ferguson "30" to make it surpass even the outstanding performance of earlier Ferguson System Tractors. Once you understand what this tractor will do, you'll agree it's the greatest value in tractors ever offered.

THE FARM PAPER OF THE NORTHEAST

## The SIDE-HILL SMITHS

By Elaine Marcley

**F**RESH from the city . . . and off\*for a visit with the farmer's wife! Out past Chenango Forks, up the road that goes by the large, rambling red and white barns of the Cloverdale Farms 'til we come to the white post box lettered GERALD SMITH. A quick, but panting climb up the front lawn of what is so aptly called a "side-hill" farm, and we are on the doorstep of one of the warmest greetings to be found among the ranging hills of New York's Southern Tier.

Mrs. Gerald Smith, her sandy-colored hair still up in curlers, and comfortably sporting a pair of practical slacks and a welcoming smile, is inviting us to come in and share a usual day in her life of keeping a family of four well-fed, well-scrubbed, and well-cared for.

"I have systems!" explains Mrs. Smith in a matter-of-fact way. And at the moment she has at least three orbits of activity going on around her . . . rinsing out a few items of clothing, mixing up a batch of chocolate chip cookies, and seeing that her four-year old son, Duane, keeps a fair distance from the batter bowl 'til she's ready to turn it over to his eager fingers for a final scraping. But we might suspect that what makes her "systems" work is her own particular brand of efficiency and easy-going composure. For while she

▲ The Smith kitchen is a bright and cheerful place to work . . . and handy too with an automatic electric range and other modern conveniences to make housework easier.

◀ Much of the Smith income is derived from raising poultry. They have about 900 hens and 1100 baby chicks to care for.

goes about her household chores, she keeps up a steady, enthusiastic flow of conversation that leads us to believe the Smith place is well-named a "side-hill" farm.

It's been up-hill going for the last 15 years, ever since they took over this 161-acre dairy and poultry farm. Cash crops won't grow well on the slope of a hill and so their income has been limited to what they can get from the sale of milk and eggs. Farm machinery was hard to get at first, but they've managed to buy themselves a tractor, which has made some of the

up-hill climbing a little easier. But their home alone testifies to the rewards of gradual change . . . the confidence in hard work and a steady purpose to bring about a more comfortable, satisfying way of life.

Just a quick look around the kitchen tells us that it's in the process of modernization, or as Mrs. Smith says, "getting fixed up so it'll be handy." Chief among the conveniences Mrs. Smith and her husband have carefully planned is her automatic electric range, which she says is a great help in preparing Sunday dinner while they're at church or when she goes out for an afternoon. Home Bureau, of which she is a prominent and active member, helped plan the kitchen. And just a step across the way from the range is a super-sized refrigerator, and the cabinet sink an easy step in the other direction. In his spare time, Mr. Smith is building cupboards and working counters all around (Continued on Page 10)

▶ Dale Smith raises poultry on half-shares with his father. From their laying hens they get between 400 and 500 eggs a day.

*Within a few weeks

be asking for your*

# 1952 SEED CORN ORDER

**S**ILO filling time is the season when many farmers order their seed corn for the next year. In G.L.F. this has become a tradition. Farmers started the practice in order to get the kind of seed that would really grow in the Northeast. This popular custom has grown because farmers have learned that they can depend on G.L.F. seed.

### *More Efficient Service With Early Orders*

When farmers tell G.L.F. what kind of, and approximately how much, hybrid seed corn they want for next spring it takes a lot of guesswork out of buying seed. Pooling these orders in the fall of the year, plus the fact that the seed is moved through the already established

G.L.F. service agencies, makes it possible for farmers to save thousands of dollars on their G.L.F. Hybrid Seed Corn.

### *Select A Corn To Fit Your Farm*

The varieties adapted to the growing conditions in your area are shown on the G.L.F. Hybrid Seed Corn Chart now on display at your G.L.F. service agency. Right now, during the corn harvesting season, is the time to look over this chart and place your order for 1952. You will then be sure of the kind you want, the quality you need, and a real down-to-earth price.

Cooperative G.L.F. Exchange, Inc., Ithaca, New York.

## FROM THE Editor's Mailbag

### ROUGH ON CATTLE THIEVES

I have noticed for some time that your paper is making a great fight against cattle rustling. I was a victim last year—losing two young animals.

I see the penalty you inflict in your state is much lighter than here. I enclose two clippings from the Washington Star. These have taken place within 40 miles of the National Capitol.

I hope you will continue your good work, and in time we shall drive them from the country.

I enjoy your paper very much, having been a reader for over 50 years. I do miss Ed. Babcock. I always felt I knew him. — *J. B. Waters, Germantown, Md.*

EDITOR'S NOTE: The clippings Mr. Waters sent reported the arrest and conviction of two men who stole cattle—James Kegley of Adamstown was given a 5-year jail sentence and Jackson Faulkner of Westminster was given a 4-year jail sentence. Good work! — A.A. —

### GASSING CHUCKS

I have found that calcium cyanide is the surest and easiest method of handling woodchucks. All I need is a pail of water, a can of calcium cyanide, a shovel and a discarded tablespoon. I moisten the ground around the entrance, then put a heaping spoonful of cyanide as far down as I can reach, and then close the hole with sod and dirt.

I use the granular form of cyanide. Possibly dust would penetrate a little better, but either is effective.—*Frank Lucy, Poughkeepsie, N. Y.*

— A.A. —

### WATER SOFTENERS

I was interested in the article by Hazel Cosline, "I've Gone Upstairs with My Laundry," in your August 18 issue—particularly in what she said about using a water softener. How does it work and what kind does she use?

—*Mrs. M. R., New York*

There are several water softeners on the market, and directions on the package should be followed when using them. At present, Mrs. Cosline is using "Calgon." Use of a water softener gets rid of undissolved soap curds left in the fabric when hard water is used. If you are using hard water, you are likely to find that the addition of a water softener will result in a marked improvement in the appearance of your wash.

— A.A. —

### WASHINGTON EDUCATION?

May I compliment you on your editorial "Price Controls Cause Inflation" in the July 21st AMERICAN AGRICULTURIST.

It seems tragic that points you so well raise are not better understood by our legislators in Washington.

—*A. A. Low, New York.*

## OPEN CENTERS For This Farmer Everett Lewison Vermillion, South Dakota...

"On my 360-acre farm I spend a lot of time on my tractors, and I know just about what I have to have in tires to get my work done. Maybe my soil is different, but it seems to me that Firestone Open-Center Tires pull better than any of the others."

EVERETT  
LEWISON.

## TRACTION CENTERS For His Neighbor Leaf Larson Vermillion, South Dakota

"With 550 acres to farm, I have plenty of opportunities to judge tractor tires. About six years ago I had my first experience with Firestone Traction-Center Tires, and today I have them on all my tractors. They're the best tires money can buy."

LEAF LARSON.

# Firestone CHAMPIONS For Both

THAT'S the way it is in most farming localities—Some farmers want Open-Center Tires, while others find that Traction-Centers do a better job in their soil conditions. In all probability, you have a definite preference, too.

If it's an Open-Center you like best, try the Firestone Champion Open-Center Tire. You'll find that its curved bars pull better, its Flared Tread Openings keep the tire

clean, and its wide, flat tread wears longer than treads of other Open-Center Tires.

Or—if you think a Traction-Center Tire will do your job best, try the one and only Firestone Traction-Center, the choice of more than a million farmers. Remember—only Firestone gives you your choice between the greatest Open-Center and the only Traction-Center Tire on the market today.

## KEEP GOVERNMENT OUT OF THIS:

A PROPOSITION is now being argued in Congress which is of vital interest to every resident of New York State and to every American citizen.

Bills have been introduced in Congress which call for a Niagara Falls electric power development project. There are three proposals by which this power may be developed. One development would be sponsored by the Federal government, another would place the same undertaking with the New York State Power Authority, and the third proposition is advocated by the electric power companies in the State, who have told congressional committees that they will jointly organize and finance a company to construct the project without expense to the Federal or State governments.

The cost of the project has been estimated at over 300 million dollars. All parties are agreed that more electric power is needed, and it is claimed that with care the power can be developed without injuring the scenic effect of the falls.

The principle on which the decision should be made is clear. The question before the people is, Do you want more and more government, meaning more and more socialism, in business, or do you want to continue to maintain your liberties, your way of life, and your free enterprise? It seems to me that if this project is carried out by either the State or the Federal governments, much more statism, more socialism, and more loss of liberty will result.

Those advocating the State plan claim that a state law prevents the power companies doing this development job; but in similar cases, courts have ruled that international waters like the Niagara River are under Federal, not State control. If this is true, then Congress has full power to grant the authority to the private power companies to go ahead and do the job.

The argument is also made that either State or Federal sponsorship will mean lower cost of electricity to the consumer. That definitely is not true. Government operation is always more costly and inefficient than private operation. A government-supported project would operate tax free, while a free enterprise would yield great tax returns. In this particular case it is estimated that the tax returns to Federal, State and local governments would amount to \$23 million annually. This annual tax income would be in addition to the 300 million dollars saved taxpayers for the original cost.

Putting it another way, if the power developed through government sponsorship seemed cheaper to the consumer, it would not be so in fact, because the cost would be taken out of either the Federal or the New York State treasury, and therefore out of the pockets of taxpayers. More than this, the taxpayers would lose what the power companies would have to pay in taxes on the property.

If the people of this State and nation really care about saving their liberties, the free enterprise system, and their way of life, they should watch very carefully indeed each of these costly government proposals, either of which would lead us farther down the hill to socialism.

What can you do? All of you have some friends or acquaintances in Congress and in the New York State Legislature. Take time to tell them that you want government to keep its hands out of your pockets, and that you are already paying all the taxes you can stand.

## LIVESTOCK CHORES TAKE HALF OF FARM LABOR

IN A RECENT talk, Floyd W. Duffee, Professor of Agricultural Engineering at the University of Wisconsin, pointed out that surveys showed that livestock chores account for over 55% of all farm labor in Wisconsin, where dairy farming is the major farm enterprise. About 25% is used for crop production, and 20% for miscellaneous chores, care of machinery, and business trips to town.

*By E. R. Eastman*

Then Professor Duffee went on to report how the labor cost for doing chores on a research farm in Wisconsin have been greatly reduced. A silo unloader reduced the time of getting down silage for a 24-cow dairy from about 10 minutes to about 10 seconds. Feeding silage to cows with the right kind of a cart as compared to the conventional cart and fork method reduced the time from 14 minutes to 10 minutes. A barn cleaner reduced the time from 22 minutes to 5 minutes. Cleaning cows was almost eliminated. Water piped to cows, hogs and chickens cut out all carrying of water by hand. There is now very little handling of feed by hand. A farm shop keeps machinery in working condition. A milking machine with fast milking greatly reduced the milking time. A water heater and plenty of hot water lightened the work and shortened the time of getting the milking utensils clean.

There are many other shortcuts in doing chores which with a little time and study could be worked out on most farms without much expense. With help getting scarcer and more costly all of the time, the saving of steps and labor has become a "must" on every farm.

## WHAT IS BACK OF THE PMA "FAMILY FARM" MEETINGS?

MANY FARMERS and farm leaders are looking with suspicion and a jaundiced eye on the meetings called throughout the United States by the PMA of the U. S. Department of Agriculture, to obtain suggestions for improving services to family farms.

What is the real purpose back of these "family farm" meetings? The Dutchess County, New York, farmers, through their agricultural committee, refused to hold such a survey meeting on the grounds that it was politically inspired. The great Illinois Agricultural Association similarly came out against these meetings, charging the USDA with attempting "through its 'family farm' policy review, to engage in policy-making rather than confining the activities of the Department to its proper role of administering the laws which Congress enacts.

"We do not believe," the Illinois Association continued, "that a tax-supported governmental agency can produce an unbiased report of its activities. Federal agencies that attempt to influence the decision of Congress by predetermined reports on surveys conducted by their employees are completely outside their field of legitimate activity.

"It is our belief that the intended purpose of this 'family farm' policy review is to strengthen and expand government agencies, to the end that they become dominant and stronger, with a corresponding weakening of the influence of farm families in determining policy.

"Therefore, because of the unsound procedure involved with the 'family farm policy review', the Illinois Agricultural Association is unalterably opposed to the program and methods employed in carrying it out. The project is thoroughly political. We protest the growing tendency of the Department of Agriculture to impose official thinking upon the people whom they are appointed to serve, and deplore the use for this purpose of government organizations set up to administer existing programs."

Newspaper reports of recent statements made by the Secretary of Agriculture and other USDA officials that the family farm needs to be made more efficient through better management are alarming farmers and farm leaders. They believe that these statements and activities indicate that the Department of Agriculture wants to build up, through PMA, a great government-controlled set-up, a vast organization which will take over the management of all farms and, what is equally dangerous, take away the right of the farmer to manage his business

through his farm organizations and cooperatives.

This would be the very pattern for full statism, regimentation, and complete socialization of agriculture, and the situation is all the more dangerous because the moves are disguised by fine sounding statements about getting the reaction of farmers.

## O. H. BENSON

TO OSCAR H. BENSON, who died at his home in Gettysburg, Pennsylvania, on August 15, more than to anyone else is due the credit for pioneering in the work and organization of rural young people.

As a rural school teacher in Iowa, Mr. Benson conceived the idea that the best school laboratory was Nature's own, and that hand in hand with the theory of education should go practice. So he organized his boys and girls into clubs, and was so successful that he was called to Washington to help organize the 4-H Clubs on a national scale.

Later, Mr. Benson joined the Scouts as the first National Director of Rural Scouting. His ideas are also found in the Future Farmers and Future Homemakers clubs, all based on the idea that the teaching of agriculture and homemaking and rural living is not complete without actual practice on the farm and in the farm home.

When one thinks of the great work for young people now done by organizations like the Future Farmers, the rural division of the Boy Scouts, and the 4-H Clubs, it is hard to remember that all of these organizations are so young, and were organized within the lifetime of many leaders still living. When one sees the achievements of rural young people through their organizations, and particularly their interest and enthusiasm, it is easy to believe that even with all of the problems, the future of rural life is safe.

## LET'S INCREASE DEMAND FOR EASTERN APPLES

A LETTER from a consumer says that the reason why more apples are not sold is because of their poor quality. The Northeast can grow the highest quality apple in the world, and our growers are nearest to the markets. That fact is sometimes a curse rather than a blessing because the nearby markets make it possible to truck in the poor apples as well as the good ones. Poor quality apples from the Pacific Northwest never reach Eastern markets because they cannot justify the shipping charges. Therefore, western apples too often have a better reputation than our excellent eastern apples.

I have often wondered if apple producers' associations couldn't do more to teach the local retailer and consumer to call for apples by varieties. What do you think? What else can producers do to make the consumer conscious of the high quality apples we produce on eastern farms? To get some valuable opinions and information to pass on, we will pay \$1.00 for every letter on this subject—from either producers or consumers—which we can find room to print. Address: AMERICAN AGRICULTURIST, Box 367, Ithaca, N. Y.

## EASTMAN'S CHESTNUT

WE LOST a lot of interest and fun out of country life with the passing of the old-fashioned horse trader. I wish I could remember all the funny stories I have heard of what used to happen when two horse traders got together, each trying to skin the other. If you remember any good ones, send them in. Here's one I picked up somewhere.

"What's all the commotion out front?" asked the storekeeper of the crossroads village.

"Jest a coupla fellers from down the road argy-ing," replied the clerk. "They swapped mules an' now each 'un claims the other'n skinned him."

"Well, why don't they swap 'em back again?" inquired the proprietor.

"Dunno," said the clerk, "less'n I reckon they're skeered o' gettin' skinned agin."

# AA's Farmers' Dollar Guide

**YARDSTICKS:** For better than average returns a farm should: 1. Be above average size; 2. Have crop and animal production above average; 3. Be managed so that the owner and his hired men accomplish more per hour than average.

Check your farm on the above points. Remember that the total amount of work to be done is a better measure of size than number of acres; that machinery has a big effect on efficiency; that natural fertility, use of commercial fertilizer, weed control, disease and insect control, and good varieties determine crop yields.

**PRICES:** Farm products prices have headed down for six months. Government controllers who yelled about the dangers of inflation without stricter controls look silly. Fact is, while Administration talks about controlling inflation, it fears general price drop far more than price increases. In fact, many government actions have been, and still are, inflationary.

Right now USDA officials are wondering how to bolster cotton prices and are reported to be considering price supports on hogs, but fear public disapproval.

**TAXES:** You are likely to pay 10 to 12 per cent more taxes in 1952. Without more taxes, deficit for year ending June 30, 1953, is estimated at \$22 billion. Even with higher taxes it will be plenty! Defense budget for year ending June 30, 1952, may be increased from \$60 billion to \$70 billion.

**"PAY AS YOU GO":** Big disadvantage of "pay as you go" taxes is human tendency to think in terms of take-home pay. In other words, withholding income taxes from pay checks is too painless. One employer is reported as giving workers full pay, then providing several windows at which various deductions are returned in cash by the worker.

Farmers know when they pay taxes. That's one very good reason why farmers will continue to be in the front ranks of those who demand government economy. Consumers are suffering more from high tax costs than they are from high food costs.

**HELPING HAND:** Conservative statesmen are wondering how much we can help other countries while arming ourselves. They point out danger of spending at rate higher than we can maintain for an indefinite period. A breakdown of business here would please "Reds" everywhere.

**LAND PRICES:** U. S. farms average to sell for 17% more than year ago, with biggest increase in South and West. Maine is only state to show no gain; in fact, land prices there went down 6%.

More poor farms are being sold. City men are buying as a hedge against inflation. Farm mortgage debt is rising, is 18% above a year ago. Farm land prices are expected to level off.

**TURKEYS:** Crop is estimated at 52,774,000—16% above last year; in Northeast 10% above. Maine has 124% increase.

Better plan to extend marketing over a long period. Sell a good proportion at Thanksgiving or earlier if they are ready and a market is available. More and more, turkey is becoming a year-round food.

**REMINDERS:** 1. Cull the poultry flock (see page 16 for directions). 2. Kill mice in the orchard (see page 11). 3. Avoid bruising potatoes when digging and handling. 4. Don't graze pastures and meadows too close. 5. Replace broken windows, check on roofs and chimneys. 6. Keep young stock growing. 7. Pick up and sell scrap iron. 8. Write your Senators and Congressman and urge government economy! —Hugh Cosline

## The Song of the Lazy Farmer

FALL is the best time of the year, its coming I will never fear; the days are warm, but not enough to make you sweat or huff and puff, and then things cool off quick at night to make the temperature just right so I can sleep from dark to day and get my pep all back that way. When days are fair, September skies are bluer than Mirandy's eyes, and if it should blow up a rain, why, even then I can't complain, 'cause mostly it's the gentle kind that folks don't ever really mind.

But best of all, when fall comes 'round, I love the smell of new-turned ground as neighbor, showing little sense, plows hours on end across the fence, while over here Mirandy Jane, without so much as raising cain, is turning furrows straight and true, thus leaving me with naught to do. Except to sit and watch 'em roll, or else get out my fishin' pole; in fall there's hardly time to wait 'til hungry fish fight for my bait. I'll tell you, there

just ain't much more a man could possibly ask for; a pleasant day, a perfect night, a rain that patters down just right, good fishing and a working wife—how could there be a finer life?

## CORN PICKING

*like you never saw before!*

If you want to see corn gathered faster and cleaner than ever before, just ask your Ferguson Dealer to bring out a *Belle City* Corn Picker for a demonstration.

And as for husking . . . you'll never see a gentler, more thorough job. There's virtually no shelling at all. The few kernels that do drop off the cobs are saved and sent up the elevator to your wagon box.

### Here's what a **BELLE CITY** demonstration will prove to you . . .

1. *Belle City's* lighter weight permits faster ground speeds, especially when the ground is soft or wet.
2. The high-speed blower keeps trash and husks away from the wagon elevator . . . gives you a cleaner, better storing crop.
3. Better design eliminates stopping to clear clogged passages.
4. Combined finger tip and hydraulic controls simplify and speed adjustment of gathering points to suit ground or crop conditions.
5. Interchangeable rolls provide normal or extra-gentle husking action to suit condition of crop.
6. Interchangeable units provide either snapping alone, or combined snapping and husking.
7. Simple, fast adjustments can be made in the field to save time and trouble. These include V-belts . . . husking-roll pressure, snapping-roll spacing.

the American Farmer  
is relying on  
Quonsets for...

In the last ten years production methods on the farm have been tremendously speeded by the use of modern machinery. Many crops are now harvested in days instead of weeks. This stepped-up productivity has emphasized the need for farm service buildings that are more functional—buildings which are efficient *production tools*—which supplement machinery in increasing the production of both crops and animals.

With a Stran-Steel Quonset, the farmer has the finest non-combustible farm service building obtainable. It provides maximum comfort, convenience, efficiency, durability and adaptability. Its clean functional lines make it a source of pride and satisfaction. Its low maintenance cost and dependability mark it as a sound investment that will keep on producing year after year.

# Packing Apples in CARDBOARD BOXES

By E. STUART HUBBARD

**D**URING the past thirty years we have had varied experiences with packing apples in corrugated and cardboard cartons. Before the Eastern apple box was standardized, we sought a package in which to pack McIntosh and Spies in layers and in cardboard cells to prevent bruising and skin cuts. We adopted a corrugated carton in three sizes to take six sizes of apples, two for each carton.

We found that these were satisfactory for shipment to nearby markets if the fruit was packed in layers between cardboard; if the cartons were kept dry; if they were not piled high in truck or warehouse; if hand trucks had a board frame on which to pile the cartons, and, if stored for any length of time, they were piled so that the air could circulate freely past at least one surface of each carton to keep the fruit cool.

For express or distant shipment we still use a carton made from board having two thicknesses of corrugations built together to provide extra strength. A single corrugation board can be used with a snug fitting corrugated liner, but it is not so rigid as the double corrugation board.

#### Advantages of such cartons are:

- 1—They cost less than wooden boxes.
- 2—They take colored printing beautifully and cheaply.
- 3—Empty, they take little storage space until set up.
- 4—They can be made any size or dimension desired.
- 5—They can be delivered on rather short notice.

#### Disadvantages are:

- 1—Softening and collapsing when piled if wet by rain or the sweating of cold apples.
- 2—The bruising of fruit by crushing from side pressure or by hand truck irons on the bottom carton of a pile.
- 3—The lack of cooling if piled closely in storage.
- 4—Bulging by inside pressure of jumbled apples.
- 5—No salvage value like apple boxes to the retailer.

With the adoption of the Eastern apple box, we discarded cartons, since we can layer all sizes or pack jumbled in only one dimension box. Its rigidity and moisture proofness afford good protection and permit storing and shipping in moist conditions.

We have tried many sizes and types of consumer units, from  $\frac{1}{2}$  bushel to two pounders, including cellophane trays.

#### We have found that:

- 1—Consumers in big cities prefer small units.
- 2—Individual retailers who have clerk service will not buy them, as consumers prefer to see each apple.
- 3—They usually add about one cent per pound to the cost, though they may save the retailer cost of paper bags and time in displaying or selling.
- 4—Some husbands consider them extravagant and of extra cost.
- 5—They cost more to pack.
- 6—When they sell slowly, some apples may lose freshness, causing dissatisfaction and prejudice.

One large distributor who uses a cellophane tray successfully for part of his output says that 12% of the total volume he sells seems to be as many as can be expected to move in small packages.

One large chain store company found that the apples sold in a small cardboard carton bruised less in self-service stores and returned them more net

profit. When, however, a layer pack of McIntosh from the Eastern box was piled on the counter or sold from the box along with the small unit, sales of the unit continued freely with added sales of as many or more of the loose apples.

Experiments by Cornell scientists also prove that more sales were made when both bulk apples and small packages were offered.

Beautiful, fresh, unbruised apples uniform in size and color, displayed where the consumer can see them, will sell themselves better than when partly concealed in a package.

There is no one perfect package for apples to suit all consumers, retailers, distributors or packer. Growers must use what proves best for their conditions.

— A. A. —

## LIME--A Good Buy

**T**HE best buy among the major crop production supplies which farmers purchase is limestone. The prewar dollar is still worth about eighty cents when it comes to purchasing this commodity. The comparison is even better in areas where spreading service is available, since approximately the same cost holds for limestone spread on the field as delivered in bags.

The returns from the use of needed limestone are also high, usually around \$5 to \$10 in extra crop value for each dollar invested in lime. The exact amount of return depends on the need for lime and the value of the crop.

Liming a soil to the proper point renders non-toxic many elements which are otherwise toxic to plants, and also increases the availability of the phosphorus already present in the soil and the efficiency of applied phosphorus.

The calcium and magnesium in lime are important plant foods. Lime also permits the growth of legumes, and through these legumes it may be said that lime is responsible for a large part of the nitrogen needs of a rotation in which they are grown. In common feed crop rotations, it can be truthfully said that adequate use of lime directly benefits every crop in it.

Except for specialty crops or special conditions, most authorities agree the best way to use lime is to apply enough the first time or two a soil is limed to correct the acidity to the proper point. From there on, apply maintenance applications at convenient times in the rotation. One of the best times is on sod ground the summer or fall before it is plowed, but there really is no harm in using lime so long as spreading machinery can cover the ground without damage to the soil. The most important thing about lime is to use what is needed.—George Serviss

*Discover Velvet Velocity!*

*See how easy driving is!*

The Styleline De Luxe 2-Door Sedan  
(Continuation of standard equipment and trim illustrated is dependent on availability of material.)

*Take traffic in stride!*

*Cruise the highways!*

You're about to take a "discovery drive" in a Powerglide Chevrolet. You start the engine, slip the control lever into "Drive" position . . . and your "work" is done!

There's no clutch pedal to push . . . nothing to do with your hands but steer the car. When you want to go, you press the accelerator. When you want to stop, you press the brake pedal.

In less time than it takes to tell about it, you're the *complete master* of this thrilling new way to drive.

And what you enjoy most is the wonderful sensation of velvet velocity . . . a smooth, unbroken flow of power from Chevrolet's exclusive "power team"\* of big 105-h.p.

valve-in-head engine with Hydraulic-Hushed valve lifters, Powerglide automatic transmission, and EconoMiser rear axle.

Only Chevrolet, of all cars near its price, brings you this special combination that eliminates all "steps" and "surges" between speed ranges. Yet a Powerglide Chevrolet costs the *least* of any no-shift car.

In fact, a Powerglide Chevrolet costs little more to buy—and in many instances even less!—than other low-priced cars with standard gearshift!

Discover the thrill that is Powerglide. Your Chevrolet dealer cordially invites you for a drive. Chevrolet Division of General Motors, Detroit 2, Michigan.

\*Combination of Powerglide automatic transmission and 105-h.p. Valve-in-Head engine optional on De Luxe models at extra cost.

## "It's hard to beat a HARDER WOOD STAVE SILO..."

That's what thousands of satisfied Harder owners have told us. And that's why so many farmers buy their second, third and even fourth Wood Stave Silos from Harder.

For year after year dependability there's no Silo with a better service record than the famous, trouble-free, Harder WOOD Stave Silo.

If you prefer concrete then the popular "red and white tap" Harder Concrete Stave Silo will prove a profitable investment. It's the talk of farmers everywhere.

Write or phone today

# How We Concreted Our TRENCH SILO

By MARK ROBINSON

**O**UR FIRST silo had cast reinforced concrete slab walls. They were cast 4" thick in forms on the bottom of the silo. After hardening, we swung the slabs up into place, using the forms for a cradle, with our heavy-duty manure loader. While we were doing this, an engineer employed on a neighboring job told us the walls would not stand the inward earth pressure when the silo was empty. When the walls did fail completely over a period of two years,

Here is Mark Robinson's experience on concreting a trench silo. Reference was made to this in the issue of February 17, 1951 with the promise that directions would appear at some later date.

If you are building or planning to build a trench silo we urge you to read Mark's experience carefully so that you may avoid the mistakes he made in his early trials.

I was willing to give the engineer an absolutely free hand in designing a new and economical type of trench silo lining.

With the help of this engineer and several mistakes, we have developed an inexpensive method of lining trench silos which has stood two years unharmed. Essentially it consists of an up-sidown reinforced concrete plaster arch on an earth form. This method avoids the considerable expense of forms, and also utilizes a wall thinner than can be worked in a form, with consequent economy in material. These savings are achieved by careful engineering and careful following of the specifications. The work does not have to be done slowly and carefully, but the order of the work and the general plan must be followed exactly for success.

### First Dig the Trench

The first step consists of making and shaping the excavation. We have used scrapers, bulldozers, gasoline shovels and, finally, a bulldozer equipped with a front end shovel. The latter is by far the cheapest and most satisfactory, with the possible exception of any one of these tools you might own.

It is most convenient to run the silo into a bank. The excavation must have a rounded cross-section similar to the ribs of a ship, as if the ship were driven into the bank. It is very important that all square corners be avoided and any fairly sharp corners reinforced with extra steel and concrete. Structurally speaking, they are the weak points. The ideal shape is the bottom third of a perfect circle. A practical modification can be made with a flat bottom, generously rounded corners, and slightly curved wall.

All walls, whether sides or ends, including doors, must slant inwards so that the silage is packed together as it is packed down. The lower end, equipped with a plank door, enables you to drive directly into the silo. The upper end, shaped in a steep ramp, provides the best place over which to bring loads.

### Drainage Is Important

Drainage for the site in general should be provided by either a natural or artificial drop of several feet in front of the lower end of the silo. In tight soils, cracked stone or coarse gravel three or four inches deep should be put in the bottom. Be sure that any

surface water is diverted around the upper sides and end. In general, height is desirable, but is not worth any special expense where length can be easily used. The width should be determined by the number of cattle you intend to feed. We have found a silo 20 feet wide about right for 40 head of cattle.

The second step is to cover the earth form, consisting of two walls, one end, and a bottom with some type of building paper. Slater's felt is the cheapest, and 45-pound-roll roofing is the most satisfactory. Paper is ordinarily omitted from under farm concrete work. The strength of the concrete, however, is in the liquid cement. The paper retains that in the mix and greatly increases its strength.

The third step is to lay on top of the paper 3/8" reinforcing rod 4' on center in the manner of ribs of a ship. These rods come about 20' in length and should start at the top of one wall, go down the wall across the bottom, and up the other side. If joints are necessary, as they probably are, lap the ends to be joined several feet and fasten with a couple of tightly twisted light form wires. 3/8" reinforcing rods, which have a purposely rough

**Building the trench silo door on Mark Robinson's farm. It was finished just ahead of the silo filling crew.**

surface, are probably hard to get now. Use anything remotely resembling them that you can find.

The fourth step is to lay 6"x6" No. 10 x No. 10 reinforcing wire mesh over the entire surface. This should be lapped 4" where it joins and the joints fastened every four or five feet with twisted light form wire. The entire mesh should be fastened to the rods beneath it every four or five feet with form wire. It is difficult to think of a substitute for this mesh; possibly woven wire fence of a similar gauge would do. The rolls of mesh should run down the wall, across the bottom and up the other wall, as that is the direction of the structural arch.

### Easier Than It Sounds

The three steps of paper, rod, and wire appear very lengthy, but once started, it goes quickly. About half the expense for material and about half the labor time will go on those three jobs. Laying a wall or building a form is more difficult and expensive.

The fifth step is plastering the concrete on to the mesh and rod. If ready mix concrete is available, considerable time can be saved. In any case, shape the top of the two walls and the high end so that concrete can be hauled around them and dropped down over the mesh. A lot of it will stick on it on its way to the bottom and you won't have to shovel it up. The concrete mix should be 1-2-2 with the small size gravel. As little water as possible should be used for a stiff, dry mix that will stick on the walls. The concrete is applied only about 2" thick. It is shoveled into place and then troweled down. To handle a dry mix, the trowels should be kept wet. Joints in the concrete work must follow the same ship-rib line. That means start at one end and work the walls and floor back together.

The sixth and last step is to cover the concrete with the same type of

paper used underneath it. This cover is also usually omitted in farm concrete work but is very important, especially in warm weather. It should be kept covered for at least three days, and the longer the better. This paper can be reused to go under your next concrete job.

The door jambs should run forward into the silo as they go down in order to slant the door. The jambs are constructed by working a bump in both walls with a flat shoulder on the side towards the silo. This shoulder should be about 4" deep on a horizontal line to take a good grip on the plank door. The bumps in the concrete for the jambs should be backed by an angle iron or small roll of mesh wired on top of the regular wall mesh. The parts of the silo walls extending out beyond the door jambs not only hold the jambs in place but also act as wing walls to stop dirt from running out in front of the door.

The door can be constructed of horizontal 2" planks. They must be braced every four or five feet with A-frames or stiff legs. We have found 6x6s to be heavy enough with 2x4 trussing. These are in turn held forward by pegs driven in the ground. A broken truck axle makes an ideal peg.

Three men and myself constructed a manure pit of this design 80' long,

16' wide at the top, 8' wide at the bottom and 6' feet in three days after the earth was shaped. Our hours were only those available between chores.

We cover our silos with 4" to 6" of sawdust. In my opinion rain and snow, as distinct from surface water, are beneficial. They keep the sawdust wet, and the sawdust keeps the top of the silage wet. As long as the silage remains wet, it will not start to burn and rot. If the silo is filled with dump trucks, which I consider the most practical method, the loaded trucks will pack the silage tightly. Something like a jeep or tractor rolling the silage ahead of the trucks will enable the trucks to navigate. Silage cut wet enough in the first place, packed with loaded trucks, covered with sawdust kept wet by the weather, will have almost no spoilage. If I were given a trench silo with a roof on it, I believe I would remove the roof.

We have gradually fed more and more meadow silage, and less and less of other forms of roughages. Now we feed hay only to our calves under four months of age. It might be wise when constructing your first trench to leave the concrete work out of the high end. Then when you felt you wanted more silage, and could afford it, the silo could be lengthened without difficulty or waste. The reinforced concrete plaster arches making up the side walls and bottom are structurally independent of either end. The ends may be safely omitted, with the possible exception of a location where there would be a great deal of underground seepage through an earth end.

The design and construction of vertical silos have been perfected by many people over a period of years. Trench silos are older historically, but are still in a primitive stage of arrested development. Our experience is submitted with the hope that others will build on it.

# "We haul poultry feed for only 1<sup>4</sup>/<sub>5</sub>¢ a mile!"

—says Russell Deaner,  
Eglantine Farms, Greensboro, Md.

"Ford Trucks operate more economically than any other trucks  
we've ever owned," Mr. Deaner and Farm Mgr. Farlow report.

"They do more work in less time!"

Eglantine Farms has eight Fords to haul poultry feed for Maryland farms. They entered a 1950 Ford F-1 Pickup equipped with POWER PILOT in Ford's nationwide Economy Run, and report:

"During the six-month Run the F-1 Pickup traveled 12,994 miles, with plenty of stop-and-go driving. But the total amount we spent for gas, oil, maintenance (with no repairs) came to only \$233.65. That's a running cost of only 1.79 cents a mile!"

Like others who rely on Ford for low running costs, you can be sure of money-saving service from your local Ford Dealer. For more facts on the trucks that last longer *and* save you money every mile—mail the attached coupon.

This 6½-ft. Ford Pickup for '51 is built for "Monday hauling" and for "Sunday calling!" Body has sturdy wood floor. Floor-to-ground height is only 24 inches. Gearshift lever is on steering column. Wider, 3½-ft. cab rear window provides

50% more rear visibility. Two fine cabs available, the 5-STAR and, at slight added cost, the 5-STAR EXTRA give extra driving ease and efficiency. Ford builds over 180 models to fit your job. Your choice of V-8 or 6-cylinder engines.

Availability of equipment, accessories and trim as illustrated is dependent on material supply conditions.

## POWER PILOT HELPS POULTRYMEN HOLD DOWN HAULING COSTS

The Ford Truck Power Pilot is a simpler, fully-proved way of getting the most power from the least gas. It is designed to synchronize firing *twice* as accurately. You can use regular gas . . . you get no-knock performance. Only Ford in the low-price field gives you Power Pilot Economy.

# WHICH OF THESE TRIPLETS WERE FED KAFF-A?

## WHICH HEIFER WAS FED EXPENSIVE MILK?

(Answer Below)

Molly, the heifer on the left, was fed expensive milk at a cost of \$29.25 to 12 weeks of age. Dolly and Polly, the heifers on the right, were fed Kaff-A at a cost of only \$12.10 for the same period. All 3 are healthy, fast-growing heifers. In fact, we have trouble telling the difference! Don't you? Same breeding! Similar results! Kaff-A saving—\$5 to \$6 per month per head.

**Feed Kaff-A and sell your cow's milk! Kaff-A is the safe replacement for expensive cow's milk in calf feeding.**

ing. Feed Kaff-A and you can sell all your cow's milk from the 10th day on. Just one 50-pound box of Kaff-A, fed with low-cost hay and grain, releases up to 500 pounds of milk you can sell and still raise healthy heifers.

**Dolly and Polly** are just two of two million healthy heifers raised with Kaff-A . . . proof you can raise calves just as healthy and fast-growing with Kaff-A as if you fed them milk. Kaff-A is tried, tested, proved!

**Don't take a chance** on inferior imitations of Kaff-A! Don't gamble with your calves' health! Get Kaff-A, the safe replacement for cow's milk, from your feed store or milk plant today. Then sell your cow's milk. Her calf won't need it with Kaff-A!

## The Side-Hill Smiths

(Continued from Page 1)

this work space, with well-styled cubby holes for a radio and other knick-knacks a woman likes to have around the kitchen.

Over behind the range is a compact corner where the family eats, and where a large window looks out upon a sweeping view of the outlying hills. Plenty of fresh greens and yellows — with a fine touch of red here and there — make the room a bright and cheerful place to work.

The one convenience the Smiths still look forward to having is an automatic water heater. Right now they're using a 10-gallon gravity type heater from which they siphon off a pailful by pouring in an equal amount of water. The only trouble is that it gets emptied about twice a day with baths and dish-washing. But, again says Mrs. Smith, "I have my systems!" And when she needs an extra supply of hot water on washday, she heats it in the electric egg washer.

It's easy to see the pride Mrs. Smith takes in her kitchen, but it's a modest pride. And in typical housewife fashion she continues to fuss about the worn congoileum . . . and to bide the time when plans will materialize for partitioning off the far end of the kitchen for a dining room.

Still, it's a toss-up whether she more enjoys showing off her kitchen or their new bathroom. For practical purposes, a big, deep, double-duty sink has been installed so that her older son, Dale, and his father can wash up for meals at the same time. All the plumbing and installation of bathtub and shower were done by Mr. Smith—not an experienced plumber—but who learned by "asking around."

### Spare Time Hobbies

It is no surprise to learn of Mrs. Smith's own hidden talents that have helped spare them considerable refurbishing expense. She points out an antique cherry-wood table that she refinished after taking some Home Bureau courses. By going down to the natural and beautiful grain of the wood, she has managed to transform other old pieces into furniture that looks like new. Partly for fun and partly for extra earnings, she does an artistic bit of chair caning and stenciling in order to buy some new drapes for the parlor . . . confessing that the one thing she doesn't like to do is sew. And then we notice some aluminum trays on the mantle — handmade, of course — into which she has learned to burn ornamental designs of leaves and flowers with an acid. All these things she does during her evenings when she says the family likes to get together and listen to the radio, or do "little odd jobs."

Just then in walks a tall, ruddy-looking lad of 18—Mrs. Smith's older son, Dale, who soon disappears down cellar. It is there, Mrs. Smith explains, that they do their egg sorting, washing and packing. Wednesday is egg-shipping day, and so Dale is getting ready for market. Dale is particularly interested in poultry husbandry (he spent a year studying it at Cornell University) and now is getting some practical experience working on half-shares with his father. But like most farm boys of his age, he is anticipating the draft and the hardship it will create for his family because so much of the care of their 900 hens and 1,100 baby chicks depends on his help and so much of the Smith income is derived from raising poultry.

### Hen House

Dale is helping build a large three-story hen house that stands off down the road a bit. When it is completed, it will replace the cellar as a storage and shipping area. From their laying hens they get between 400 and 500 eggs a

day. Mrs. Smith usually helps out by making one of the two daily egg pick-ups.

She has a good-sized chick brood of her own that she raises for broilers, and among her daily chores is their care. But of more interest, she thinks, than her own brood are those of Dale's. He has taken prizes in the State Chicken of Tomorrow Contest for raising fine specimens. Each year he ships 50 of his best stock to Troy, N. Y., to be judged on the basis of weight, skin color and mortality rate.

The Smiths have had electric service on their farm for only the past 7 or 8 years. However, they have put it to work for them in many of their farming operations and in their home, and are continuing to plan for more and more of it. In raising poultry, they use it for brooding chicks, for ventilating the hen house, and for keeping lights on the laying hens morning and night. They also use it in their dairy operations. They have 21 head of stock, 15 of which are milking cows. Two electric milkers seem to take care of this size herd quickly because unlike farmers who have to get up before sunrise, Mr. Smith starts work at 7:00 every morning and gets his milking done before breakfast, which is at 7:30. There's an electric cooler in the milk house, and an automatic hot water heater to be installed very soon right alongside it.

### A Home Garden

In our tour around the farm, we noticed a large garden plot, which also falls within the range of Mrs. Smith's extra duties—not to mention the flowers and shrubbery she tends each spring. In summer she does a lot of canning and preparation of meats, vegetables, and fruits to be stored in the freezer locker they have in Greene, New York.

When we get to the barn, the sudden excitement of 4-year-old Duane, who has trailed along, indicates that he is about to show us something special of his own. And it turns out to be a baby calf that his father has given him to take care of. He feeds and waters it, and, although he has never given his calf a name, he regards it with all the fondness of a proud parent.

But something unexpected is in the offing. Mr. Smith loads another young calf into the trunk of their '49 Chevie to be taken into town for sale. And soon we are driving off with Mrs. Smith to deliver the calf to the auction block at Greene . . . where we see him weighed in, tagged, and pushed down the runway to be auctioned off by the pound later in the day. We would like to stay to see this, but it is almost lunchtime. So we head back to the farm, where a substantial lunch is quickly prepared—hot roast beef sandwiches, plenty of fresh milk to drink, and chocolate chips and applesauce. It has to be pretty substantial to keep up with the appetites of two busy farmers, a growing boy, and a mother whose energy seems as boundless as the many miles she must cover each day in her housekeeping and farm chores.

We find the Gerald Smiths a pretty warm-hearted, self-sufficient family. A "side-hill" farm, after all, isn't the easiest kind to make productive, but these people have made us feel that uphill going has not only been a challenge, but a conquest for them. In leaving, we take away two things in particular to remind us often of our visit . . . a jar of homemade maple syrup for remembrance, and this piece of homespun good sense for thought: "We like material things . . . that's what we work for. But we don't like to be so busy getting them that we forget how to enjoy them, too."

## Question Box

**What can we do to stop damage to apple trees by mice?**

The principal control is still poison. You can usually get U. S. Field Mouse Rodenticide from your county agent. The bait is prepared by putting a 2-inch layer of apple cubes in a pan and sifting the poison over them until a light, even coating is obtained. An ounce can will make about 10 quarts of bait. The baits are put in mouse runways, using a fork or an ice pick so you don't have to handle them.

A newer labor-saving method is to use poisoned grain, dropped by grain seeders. For example, a hand-operated garden seeder can be used to drop poisoned seed along the drip line of both sides of each tree row. Seeders are adjusted to drop 10 to 20 grains per foot, which will take 3 to 4 pounds of bait per acre. This poison is more effective in good weather and should be used before the leaves drop and the grass mats down in late fall.

Prepared bait of this type is made by one or two commercial firms, or we will be glad to send directions for preparing it to any reader on request. Write to AMERICAN AGRICULTURIST, Savings Bank Building, Ithaca, New York.

There are some management practices which help to control mice, such as the use of hardware cloth around trees, especially young trees, frequent mowing to reduce the coverage; and keeping an area around the tree free of grass. They are helpful, but a man who depends on them entirely is likely to be disappointed in a bad mouse year.

**I have a piece of property which I bought at a tax sale. If I repair the buildings and then the former owner redeems it, will I be paid for the money spent on repairs?**

Unpaid taxes are sold at tax sale. The purchaser of the tax merely purchases a claim against the property. The purchaser does not actually get the property until he obtains a tax deed. The majority of delinquent taxes are redeemed during the redemption period. When the tax is redeemed, the purchaser of the tax is refunded his money with interest at a reasonably

high rate. Consequently, the purchaser of taxes at a tax sale does not have the right to go on to a property and do any repair work or use the property.

If you are interested in purchasing property in your county for taxes, I would suggest that you discuss the local procedure with your county treasurer. The procedure followed varies from county to county. In some counties the length of time between the sale and the time the tax deed is given is reduced considerably. None the less, it is necessary to wait through the redemption period before you can use the property.—C. A. Bratton.

\* \* \*

**What is the best measure for timing sprays to stop apples from dropping?**

Perhaps the best measure is to apply the spray when the first sound apples

begin to drop. To do this, clean up the early diseased or insect-damaged drops under a few trees and then watch for sound drops. Some growers plan two sprays—the first one a few days ahead of the expected drop and the other one four to six days later.

The hormones require from one to three days to become effective, and they work best if they are applied when the temperature is at least 70°.

The period of effectiveness of one application is about seven days; and where two applications are used, the effective time is increased to from ten to twelve days.

\* \* \*

**Can you give me some figures as to a reasonable charge for a field chopper?**

In a study made in Oneida County for the year 1949, costs of operating

field choppers were obtained. The cost of operating a power take-off chopper was \$1.75 per hour. This was the cost for the machine only and did not include the tractor, the operator, or any other equipment which might be furnished in doing custom work.

In the Oneida study, rates were obtained for doing custom field chopper work. The most common rate was \$15 per hour. This included chopper, blower, two tractors, two trucks, and two men.

In a recent survey made on custom rates charged in New York State in 1950 the most common rate reported for field choppers was \$12 per hour. The range was from \$8 to \$15 per hour. A Michigan report on a similar study gives a charge of \$10 per hour for use of the field chopper, tractor, and operator.—C. A. Bratton.

## IT'S FAST AND HANDY FOR BUILDING RURAL LINES

1 New two-man telephone truck ready for business. Designed for hard-to-get-to places.

3 That does it, take 'er out! Everything's up front where operator keeps a sharp eye on the job.

2 There goes its power digger. Hole will be ready for the pole in a few minutes.

4 Digger laid aside and pole picked up by the derrick without moving the truck.

5 Pole is placed straight up ready to be tamped in. Truck and its power tools do most of the work.

IN THE hands of a two-man crew this new Bell Telephone truck can dig a pole hole in minutes and hoist and place a thirty-foot pole without moving out of its tracks. It can take up old wire, haul materials and tools, and do a lot of other jobs. It has all-wheel drive and a power-operated derrick, digger and reel. It's a fast, handy, go-where-you-want-it piece of equipment.

Telephone work, like farm work, takes experience, skill, and tools for the job. Equipment like this truck is one reason the United States has more and better farm telephone service than any other country in the world.

6 Here is the take-up reel for recovering used wire. Reel, winch and digger are powered by the truck engine.

Owen A. Hart, R.D. 1, Mansfield, Pa. and "Jake" to whom Mr. Hart owes his life. Recently Mr. Hart with Jake and a pitchfork as reinforcements, started to drive the herd sire into the barn. The bull attacked him, throwing him into the air several times. Then Jake went into action and diverted the bull's attention until Mr. Hart escaped, but not until he had received some broken ribs, a broken left arm and minor bruises.

## Identical Twin Heifers used in Amazing Feed Test\* at DAWNWOOD FARMS

**CANDY on Milk**  
gained 103 lbs. in 3 months...  
COST **\$57<sup>33</sup>**

**SANDY on CAF-STAR**  
gained 112 lbs. in 3 months...  
COST **\$14<sup>95</sup>**

\*Test conducted under normal dairy farm conditions. Weights taken monthly by E. Van Steenburgh, D.H.I.A. supervisor.

We take pride in the calves we raise on our farms. That's why we created CAF-STAR. When the identical twin heifers, Candy and Sandy, were born, we made the famous feed test which proved that CAF-STAR helps develop bigger animals with better bone growth—and at a big saving. We feel that all dairymen should know about CAF-STAR.

Cordially,

*Dawnwood Farms*

Just mix CAF-STAR with water and feed quart for quart instead of milk. The 25-lb. package feeds a calf for one month at a cost of 16 cents per day.

Buy at your feed dealers in 25-lb. bags or 100-lb. (economy) bags. (Metal pails sometimes available.)

DAWNWOOD FARMS, AA-4, Amenia, N. Y.

## Guernsey Calf Starts Lad Toward Dairying

**B**EFORE he is through school Leslie Rathbun, New York farm boy, will be on the way toward a thriving dairy enterprise. Cows didn't interest Leslie too much and his life on the farm was routine—doing the chores in the morning, going to school every day—it seemed like nothing much was doing until one day an opportunity came.

Leslie's home town is Cherry Valley and the Rotary Club there offered him a registered Guernsey calf as a start in a FFA project. The Club gave him the calf and Leslie agreed to pay \$75 for it or else give as payment the first heifer calf.

When his Guernsey produced a heifer calf Leslie liked her so much he decided to pay his debt in cash, and instead of having just one Guernsey, he had two. Today, Leslie's herd consists of eight registered Guernsey cows, worth thirty-three times his original investment. Also in the herd are about twenty-eight head of grades.

Leslie's father, Warren Rathbun, was not sold on the idea of raising a purebred herd, but since Leslie has been studying breeding and has had some outstanding production from his registered stock, Warren has become equally enthusiastic. Together, father and son have revolutionized their farm and the management. Today, they have a working system for keeping herd records and have enrolled the herd in the D.H.I.A. They watch the records carefully and they are proud of Leslie's milking cows that have produced better than the grades.

Milk from the whole herd is pooled for sale and the income goes into the general family treasury. Leslie figures this is no more than right because it is one way of returning to his father the cost of feed and overhead which his father has invested, helping him raise the cattle to producing age.

A farmer is in the making and it all began with FFA and a registered Guernsey calf donated by a Rotary Club. For two years Leslie served as secretary of the Otsego County FFA unit and as president of his school chapter. He has a sharp eye for judging and his teams have placed well at judging contests.

A degree of Empire Farmer, highest in the state organization, was presented to Leslie at the Annual Convention of FFA in Waverly, New York, May 13, 1950. Leslie is extremely active

Leslie Rathbun and one of his Guernseys

in 4-H, the Grange and several other community activities. He believes that a good farmer not only tills the soil and husbands his animals, but also takes great pride in the development of his community.

Leslie talked about going to the State Agricultural Institute in Cobleskill. His father agreed that it would probably be the best way to learn the most modern and efficient methods of farming, so today Leslie is studying hard, and at the same time, keeping in close contact with the home farm. When he graduates from the two year course he hopes to be able to buy a small farm near his father's and set up a cooperative father-son agreement and then run the farm business.

These Future Farmer students from Kennett Square, Pa., are winners of a National Award by the American Institute of Cooperation for leadership in cooperative activities. From left to right: Ernest E. Antes, sentinel; Milton Mendenhall, president, 1951-52; Walter Jacoby, adviser; Melvin E. Crossan, secretary, and Donald P. Hillips, treasurer.

As winners of the contest they received an all-expense trip to the annual convention of the Institute at Logan, Utah from August 26 to 30. The chapter, with 48 members, did over \$100,000 worth of business cooperatively during the year as a result of their agricultural projects.

# Milk Publicity and Advertising Starts in Greater New York

**O**N April 25, 1949, dairy farmers from several farm organizations met at Syracuse, N. Y., to organize "Milk for Health." The purpose of the new organization was to enlarge and coordinate the promotion and advertising of milk and its products already being done by the American Dairy Association and the National Dairy Council.

On June 1, 1951, deductions of 1 cent a cwt. began from the milk checks of more than 37,500 dairymen whose milk goes to the metropolitan New York area. Before that, 9,000 dairymen whose milk had been going to upstate cities had been contributing money to advertise and publicize milk, some of them for two years.

## A Big Job

The total sum to be contributed by dairymen is estimated at \$425,000 a year. Sounds like a lot of money, but with milk consumption lagging, there's a big job to be done. Every glass of milk consumed as fluid which would otherwise be manufactured into butter or cheese adds to dairymen's incomes.

About \$175,000 yearly will be spent by the American Dairy Association to advertise milk and its products. Harold Stanley of Skaneateles, N. Y. is president of the ADA of New York and Carl Camenga of Syracuse is executive secretary.

About \$250,000 a year will be spent by the National Dairy Council on educational work among women's clubs, parent teachers, schools, nurses, doctors, and youth groups. Ed Harmon is Eastern Regional Representative of the National Dairy Council.

## Dealers Help

For this work (not including ADA advertising) 24 New York City dealers handling about 60% of the Class 1 sales in the area, will contribute 1 cent a cwt. on milk sold by them as Class 1-A, (fluid) milk. They will contribute about 2 cents for every 3 cents from producers.

The Dairy Council of Greater New York is governed by a board of directors of not less than 16. Seven of the board represent producers. They are: John B. Halloway, R.D. 2, Amsterdam, N. Y.; Clarence Little, Sussex, N. J.; John Roebuck, Walden, N. Y.; Orrin Ross, Lowville, N. Y.; Morelle Cheney, Dairymen's League, 100 Park Avenue, New York City; Ross Kinney, Eastern Producers Cooperative, 403 Larned

Bldg., Syracuse, N. Y.; Elmer McCann, Chateaugay, N. Y.

Back in 1949, there were many who said the plan would never get under way. It became effective only because many interested producers worked endless hours. Now the task is to complete the sign-up and bring every dairyman into "Milk for Health."

## Gets Results

Over in New England they have been at the job longer than in New York. How are they doing?

Convincing proof that milk promotion increases consumption comes from Boston. In five company cafeterias, Dairy Council posters shown on Cafeteria walls for 4 weeks increased milk consumption by an average of 18%. Insurance company employees obviously believe in good salesmanship; they drank 38% more milk. Bankers, on the other hand are traditionally conservative and slow to mend their way. They increased consumption a mere 12%.

That was just one small effort of the Council. For the first 7 months of 1951, workers for the New England Dairy and Food Council spent 34% of their time on school children, 32% on adult milk consumers, 21% on doctors, dentists, nurses and hospitals and the remaining 13% explaining their work to the public, including those who support the program.

## Science Backs Claims

And in addition to the value of their work to dairymen, all those who earn their daily bread by working for the National Dairy Council in the American Dairy Association can truly feel that they are performing an important public service. More than any other food, the importance of a quart of milk a day for children and a pint a day for adults is backed by overwhelming scientific evidence. And in the economic field, unquestioned figures show that now the average industrial worker spends 8.2 minutes to earn enough to buy a quart of milk. Back in 1939, it took 11.4 minutes!

Surely dairymen would be missing a golden opportunity if they failed to tell city consumers about the healthfulness and economy of milk. Are you one of the few who are not doing your part?

— A. A. —

It is plainly apparent that a strong, resourceful and productive farm equipment industry is almost as urgently essential to our economy as a whole as it is to agriculture.

Chester H. Lang, vice president of the General Electric Company in charge of public relations, presents certificates of achievement to four winners of radio station WGY's \$200 scholarship awards.

Shown above, from left to right, are James Ryan, Jamesville, N. Y., winner of the Future Farmers of America division; Beverly Bryden, Walton, N. Y., Future Homemakers of America award; Mr. Lang; Grace Fox, DeRuyter, N. Y., scholarship winner in the 4-H Club girls division; and Norman Rask, Duanesburg, N. Y., winner of the 4-H Club boys' scholarship.

Hundreds of Dairymen are taking Advantage of this Offer! ~~\$189~~ Value DELTA Electric Lantern

More useful than a flashlight — hang this lantern on nail, etc. — work with both hands.

Handy size — enough to give plenty of light, yet fits in coat pocket, tool box, etc.

Ideal gift — anyone would be pleased with this handy, useful lantern.

Thick metal case corrosion-proof. Nonbreakable lens. Chrome handle.

Silvered reflector as in auto headlights. Gives brilliant light — has distance beam.

Snap-tested switch. Uses two regular-size batteries available everywhere. Famous Delta life-time quality.

Yours for Only 50¢

AND TAG FROM ONE 25 LB. BAG OF

Peebles' CALF-KIT

(MILK REPLACEMENT)

- Has been fed successfully to over 100,000 calves... saves 300-500 lbs. of milk per calf.
- Contains more nutrients derived from milk than any other milk replacement. Calves do better on it.
- Gives "milk fed" results at half the cost. Contains guaranteed levels of vitamins A, D and Riboflavin.
- Money-back guarantee. You must be satisfied with results in your own barn. Easy to feed.

HERE'S ALL YOU DO...

FOR THE LADIES

Send for two Extra Fine paring knives instead of flashlight. As good paring knives as money can buy—stainless, chromium steel blades, hard tempered, and ground. Stay sharp longer! \$1.68 value.

1. Get a 25-lb. bag of Peebles' Calf-Kit. At your favorite feed store. Pay for it in advance.

2. Tear off green analysis tag. You keep feeding instructions. Write on back of tag your name and address — also where you want your Calf-Kit or Flint paring knives.

3. Tape 50¢ to the tag, put in envelope and mail to the address below. Order will be filled promptly. Offer expires November 30, 1951.

ONCE bit—twice shy. I was "soft-talked" into being one of the three judges of the plowing match at the Livingston County, N. Y., Fair. You lose too many friends if you report what you see and grade plowing on what you see. And there can be honest differences of opinion. I'm glad to have had the experience, but never again.

According to a formula developed by Ag Engineering Extension, plowing is judged thus:

Back furrow straightness	10%
quality	10%
Uniformity of depth	10%
Evenness of ends	10%
Covering of trash	10%
Dead furrow straightness	10%
quality	10%
General appearance	15%
Handling of tractor	15%

Back furrow and dead furrow straightness need no discussion. They are either straight or crooked and a glance can determine the rating to apply. Evenness of ends also can be judged quickly. Covering of trash is either complete or partial and a glance will tell you how good it is. Uniformity of depth is just a matter of laying a rule against the furrow wall at several places. Thus 50% of the judging can be accomplished very quickly and fairly easy by direct comparison with commonly acceptable standards.

### Personal Opinion

That other 50% is where the "rat race" begins. Quality of dead and back furrow, general appearance and tractor handling, that whole business needs some careful definition.

Quality of back furrow in my book should be judged by having the turned soil meet with a slight ridge. If the back furrow is too flat, obviously there will be some soil not broken or there may be some spots not covered. If the back furrow is highly ridged, then the land must have been plowed but there may be subsequent trouble in dragging out the ridge. There should be some acceptable standard of height of ridge that will hold at all matches.

Quality of dead furrow is debatable, also. It should be shallow but how shallow? It should be as narrow as possible. It should be finished well by a single, full-width cut, all trash covered. This 15% for general appearance also has some jokers in it. Pairing of furrows should not be visible even though all furrows are well turned and trash covered. There should be no visible difference in width of cut. The whole appearance should be one of smoothness.

### Handling A Tractor

Then the 15% for handling of tractor can be only judged by the reaction of the judge about how he, the judge, would handle the tractor if he were in the contest. That's not so good. Obvious penalties can be assessed for "cowboying," racing, etc. Good tractor handling should be apparent from the general way the contestant handles the whole job. Does he fuss? Does he make quick easy turns using the brakes smoothly? Does he exhibit by his general manner that he knows his job, his tractor and his plow? Is he enjoying the competition? That's also subject to the judges'

# Judging a Plowing Contest

By "Bob" Burnette

Managing Director, New York Farm Equipment Dealers Association

whim and personal reactions. Not so good but how do you improve the situation?

Where do competitors make mistakes? Almost everyone can lay out a good back furrow. Almost everyone can adjust plows to show no pairing of furrows. Almost everyone can adjust plow depth to the optimum 7". However, most contestants plow too deep to be sure to cover trash and are consequently penalized for depth although the general appearance is good. Contestants plow 4 rounds to the back furrow and then wait for the first judging. This gives the contestant an opportunity to measure and lay out his plowing procedure for the dead furrow he

eliminations in a statewide meet somewhere in the central part of the State so that a winner can be sent to the national match?

### PROTECTING CONCRETE SILOS

IT IS good insurance to apply a protective coating to the inside of concrete silos. This is especially true where grass silage is put up because the juices are more acid than corn silage and in time will damage the concrete wall.

One of the best materials to use is an asphalt product designed for silos which you should be able to buy at your farm supply store. One of the advantages is that it can be used in cold weather and applied as the silage is used so you will have a firm footing on which to stand. It is just about impossible to put up a ladder of any length inside a silo.

The greatest damage to silo walls occurs at the bottom 10 feet and it is a good idea to put 2 coats on to that height. The second coat can be put on by using a stepladder.

This coating is not permanent. Sometimes you hear that 2 coats are recommended for the entire interior of the silo, but experience of some dairymen indicates that a coat every year plus 2 for the lower 10 feet of the silo is better than 2 coats every 3 or 4 years.

— A. A. —

### ONE YEAR DAIRY COURSE

THE New York State College of Agriculture at Cornell University will again offer a one-year course in dairy manufacturing and marketing. The course for 1951-52 will begin the third week in September.

Applicants for the one-year course must have graduated from high school and must present the 15 units of entrance credit required by the University. Previous experience in the dairy industry is necessary.

Inquiries concerning application should be directed to Professor Leigh H. Harden, Roberts Hall, Ithaca, N. Y.

#### FOR TEEN-AGERS

If you failed to see the announcement of the \$50 Essay Contest for young people on page 8 of the August 18 issue, why not look it up now and read it?

Briefly, the announcement offered prizes of \$20, \$15, \$10, and \$5 for the four best letters on the subject, "What Kind of An America Do Young People Want?"

Anyone whose 21st birthday does not occur until 1952 is eligible. Letters are limited to 600 words and the entries should be mailed to Dept. F, American Agriculturist, Savings Bank Bldg., Ithaca, New York, before October 20.

must make. Few contestants take the time to do that and thus wind up their last round with a sliver or a wide land that cannot be completely turned. Contestants that had done a dandy job up to the dead furrow then went completely haywire and left a dead furrow that was wide, deep and generally messy.

Intercounty competition is good, statewide competition is good and national competition in both level-land and contour plowing is good. Why don't we have more of it? Why not match up these young men from the counties that want to have their own

Four state vegetable queens traveled to New York City for the observance of National Vegetable Week, August 5 to 11. Harvey A. Baum, president of the Atlantic Commission Co., was luncheon host to the group. From left to right: Adele Silverman, Easton, Conn.; Clara Hay, Baldwinsville, N. Y.; Mr. Baum; Janet Nix, Annapolis, Md.; and Elsie Holding, Cedarville, N. J.

# "It's Handy"

## REPAIRING CRACKS AND HOLES IN CONCRETE FLOORS

EVERY once in a while the problem of repairing concrete floors comes up. The question is asked, "What can be done with a bad crack that leaks water? How can a repair be made that will be both substantial and waterproof?"

Unless there is considerable vibration on the floor, it is a simple matter to waterproof the floor by first cutting out the crack into a V-shaped groove to a depth of at least 2 inches. Sweep water over the newly cut concrete, removing all loose particles of cement and sand. Prepare a stiff and waterproof mortar by mixing together 1 part Portland cement and 2 parts clean, sharp sand, and wet down with a solution of 1 part liquid waterproofing and 8 parts of water. Immediately before filling the grooves with this new mortar, brush over the clean, damp surfaces a slush or bonding coat made by stirring into a solution of 1 part liquid waterproofing and 3 parts water enough Portland cement to form a thick, creamy, cold water paint. While this cement wash is still damp, apply the new mortar and trowel it to a smooth finish.

In a similar way the ruts and holes in a concrete floor can be cut out to a depth of 1½" below the finished floor and new patches applied, which will adhere to the underlying concrete and which will be waterproof, hard, and dustproof. Patches of this type harden over night so that the repairs can be made on Saturday afternoon or even on Sunday, and the floor will be usable on the following Monday.

## WHAT WASTES SHOULD GO INTO SEPTIC TANKS

WHERE A water system uses a septic tank, all wastes containing a considerable amount of solids which can be broken down by bacterial action should go through the septic tank for liquefaction and then through the aerated tile field or dry well for purification. This includes all waste from the bathroom, kitchen sink, and any dairy and canning operations. Sink and other greasy wastes should always go through a grease trap to remove as much as possible of the grease before it goes into the septic tank. Floor washings usually should go through a separate drain, as they usually contain nothing but dirt; and laundry waters are better handled through the basement drain, since they often contain much soap and chemicals and dilute and retard the septic tank action.

Small amounts of sink solvents and strong lyes can be handled by the septic tank, but large amounts are likely to destroy the bacteria and stop the liquefying action of the septic tank and should be kept separate and emptied where they will do no damage. Paint and varnish scrapings and rags should be piled in a burner outdoors and burned at once.—I. W. Dickerson.

This handy rack for feeding calves was made by Dick Quinn of Broome County, New York. Once the hay is put in the rack, the top is pushed to the left so the hay is inside the pen, and then the rack is held in place by the latch shown at top of the picture.

At the lower right is a grain box which can be filled outside and then slipped into the pen.

## MASTITIS TREATMENT

Every dairy farmer hates to admit having any touch of mastitis in his herd, but it happens to the best of us. If you doctor the cow yourself, using tubes of penicillin like Squibbs, try this method of getting the stuff to work quicker:

Take the tube, leaving it intact, and drop it into a quart of good warm water for ten to fifteen minutes. Then as you insert the tube, rolling up from the bottom, the penicillin gushes quickly into the quarter of the cow with much more ease and with quicker effectiveness than when it is left in paste form. This has been tried several times on our farm.—Mrs. Sinclair O. Ward, Franklin, N. Y.

—A.A.—

## FURNACE FACTS

You will find a vast amount of information about heating homes in a small space in U. S. Department of Agriculture's miscellaneous publication No. 689, which has the title "Your Farm House Heating." This publication will answer many of your questions about installing various types of furnaces, as well as maintaining them and running them safely and economically.

It is available from the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C., and the price is 15 cents.

—A.A.—

## KEEPS LADDER RUNGS CLEAN

An old sack or piece of burlap wrapped and tied tightly around the first rung of a ladder will help to keep the upper rungs clean and dry in wet weather, and keep your hands and clothing clean and make your footing more secure, and thus prevent an accident.

\* \* \*

As a fire preventive, we cut one end out of a 50-gallon steel barrel to use as a trash burner for the back yard. If the fire burns too high, I place a piece of old sheet metal part way across the top to shut off fire.—I.W.D.

Despite the glamor often associated with inventions and inventors, most new machines are more the result of perspiration than inspiration.

Contributions for this page are welcome and those that are used will be paid for at the rate of \$2.00 each. Sometimes a rough sketch of the labor-saving gadget helps to explain the idea. Ideas sent to us will not be returned except on request. Send ideas to IT'S HANDY, American Agriculturist, Box 367, Ithaca, N. Y.

# VETERINARY AUREOMYCIN

Crystalline

## OINTMENT

Lederle

Does Two Big Jobs Well

Superior for Treating  
MASTITIS or UDDER INJURIES

Wide range of effective activity against organisms commonly associated with mastitis gives VETERINARY AUREOMYCIN Crystalline OINTMENT Lederle for Udder Infusion its favored position among dairymen. There is very little tendency toward the development of resistant strains of bacteria following use of aureomycin.

Milk losses from mastitis frequently are the result of injuries to udder and teats. Do not overlook even minor cuts or scratches. Apply this healing ointment promptly to all wounds and avoid the danger of serious infections. Each quarter in the danger zone should at the same time receive an infusion with one full tube as a further preventive measure.

In cases of acute septic mastitis, in addition to udder infusion, the injectable form of SULMET\* Sulfamethazine Lederle\*\* should be used. SULMET OBLETS\* may be used for later treatment.

VETERINARY AUREOMYCIN Crystalline INTRAVENOUS\*\* may be used in the treatment of septicemia as a highly effective agent against a broad range of bacteria.

For maximum efficiency in the use of AUREOMYCIN OINTMENT for Udder Infusion, as well as best management practices and disease-control procedures for avoidance of reinfection, consult your veterinarian.

Write for folder on AUREOMYCIN OINTMENT.

# Cull Boarders NOW

WHILE CULLING is a year-round task, fall is the time to give the old hens a thorough going over. Culling saves feed, reduces death losses, provides more room for good layers, and, finally and most important, increases profits.

The leghorn shown at the right is the kind to keep. She has been laying steadily for over a year and shows it by her rough plumage, prominent red comb, white beak and legs, and her pliable abdomen.

A yellow-skinned hen that has no color in her legs has been laying for a long time. A hen that has white legs but a yellow beak has recently stopped laying.

The head at the left above shows a poor producer. Her comb is pale and shrunk, her beak is yellow, her head is coarse, and her eyes are sunken.

The head at the left below shows a good layer. The comb is large and soft, the beak has no yellow pigment and the eye is bright.

## WHAT TO LOOK FOR LAYER

Red, large comb, soft to the touch. White beak (Reds may have red color, and Rocks black in the beak and legs, which do not change).  
Legs bleached nearly white after laying 8 months or more.  
Freedom from molt even after 8-12 months of laying. Birds with slight neck molt only may be laying or will come back soon.  
Full, moist light-colored vent.  
Full, soft pliable abdomen.

## NON-LAYER

Shrunk, dull comb, harsh feeling.  
Yellow beak.  
Yellow legs in birds out of production for several weeks or those not laying heavily.  
Molting in neck, back, body, and wings.  
Small dry, yellow vent.  
Hard, shrunk abdomen.

**BABCOCK'S HEALTHY CHICKS**

MAKE GREAT LAYERS

At the 1950 Storr's Conn. Egg Laying Test our White Leghorns won first all breeds, with 3899 eggs and 4124.5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the "all-time World's" record for all breeds, all tests won in 1944-45.

**WE HATCH THE YEAR ROUND**  
White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks. We own two hatcheries with 600,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

# NEPPCO Salutes Billion Dollar Poultry Industry

**C**ELEBRATING the 20th anniversary of its founding, the Northeastern Poultry Producers Council (NEPPCO) is set for its "biggest and best" combined exposition and convention to be held October 2, 3 and 4 in the massive Pennsylvania Farm Show Building at Harrisburg. At least that is the advance word from Waldo Chick, Downeast Maine poultryman with the perfect name for president of the organization that serves the billion dollar northeastern poultry industry.

One of the main attractions and profitable experiences of any NEPPCO convention is the opportunity to visit with old friends and make new acquaintances among the close to 8,000 poultry people who annually attend NEPPCO's all-star attraction. This year's theme for the anniversary exposition and convention is "The Poultry Industry in a Changing World." At the 1950 event the activities marked the first 50 years for the commercial poultry industry, and the coming program marks the beginning of the second half-century with emphasis on matters of timely interest and assistance to all poultrymen, according to Dr. Alfred Van Wagenen, managing director of NEPPCO.

Daily educational programs, Tuesday through Thursday, will include latest information on current poultry economy, the price control situation, poultry management, quality of product, feeding, and health. A special program for turkey growers will be held Tuesday, October 2.

Commercial exhibitors are cooperating 100 per cent to assure visitors that the NEPPCO Poultry Industry Exposition will be the place "where the poultry businessman meets the business poultryman." Half a dozen agricultural colleges in Neppco-land area will have special exhibits, each telling a story with a punch. Dr. A. W. Brant, USDA, Beltsville, Md., promises a most unusual educational message in the "Egg I. Q." exhibit on the main floor. Prof. C. S. Platt, Rutgers University, will be there with a fine display on egg laying tests, and Paul Turck of the Pennsylvania Test heads the committee to select the "Hen of the Year" and place her in the special "Golden Cage of Hen Royalty."

The "Neppco-sition Poultry and Egg-Cooking Contest" is warming up to become quite a big feature, directed by

Karl H. Frederick, Flemington, N. J., Auction Market, assisted by Ted Rothbauer; C. C. Wiker, Pennsylvania Power and Light Company, C. F. Smith, PENB; and H. C. Kennedy, Harrisburg Chamber of Commerce. Each is accepting entries. Valuable prizes will be awarded. Contestants submit main dish recipes in advance.

## The Educational Program

"Will Poultry Pay in '52?" The answer will come from Dr. Ken Hood, Pennsylvania State College extension economist, first thing on the first day, Tuesday morning, Oct. 2. Waldo Chick presiding. Then come "Washington Reports" from W. D. Termohlen and "Beefsteak, Pork Chops, or Drumsticks" from C. C. Warren, both PMA Poultry Branch, USDA. This is your chance to ask questions to which you will get answers direct from the Washington specialists.

"Bank More Dollars with Direct Retailing" is the panel topic for the afternoon session, moderated by Penn State's Paul Margolf. "Egg I. Q. Means Quality and Profits" comes in a panel headed by Howard Pierce, A. & P. Tea Company, New York. "Feeds and Feeding" take the spotlight Wednesday morning with Andrew Danish as chairman. On the outlook side will be "Feed—Feast or Famine," treated by Dr. L. C. Cunningham, Cornell University. The place antibiotics have in poultry feed will be ably presented by Dr. Victor Heiman, Kasco Mills, Waverly, N. Y.

After the cooking contest gets underway in the Small Arena that afternoon, Robert Thurrell will preside at a session where "Proper Merchandising Sells Poultry" will be presented by Charles D. Hawks, director, Retail Merchandising School, PENB, Chicago.

The NEPPCO banquet, arranged and presided over by Waldo Chick, comes Wednesday evening at the Mosque. Waldo is not letting any chicks out of the bag, but he assures a satisfying meal and program—with no speeches, but plenty of entertainment.

Management problems come in for special attention Thursday morning with Walter Shearer as chairman. John V. B. Rice will be chairman and moderator for the poultry disease control program on the closing afternoon. "Keeping Poultry Healthy" is a panel with four outstanding men with know-how.

Tuesday is Turkey Day with an afternoon program led by L. R. Hershatter, West Haven, Conn. A management forum will be in charge of Frank Gordy, University of Delaware, including discussion on management of breeders in confinement, by Peter Crafts, Grassmere, N. H. "Ranging Problems" is the topic to be covered by M. C. Vaughn, Lewes, Del., and "Brooding Problems" will be taken over by Jos. J. Nicholson, Hicksville, L. I. Dean Mertz, Northumberland, Pa. covers confinement rearing for market turkeys. Next is a discussion on recent developments in turkey nutrition, by Dr. E. I. Robertson, John W. Eshelman Sons, Lancaster, Pa., followed by "Turkey Health" by Dr. Beaudette, Rutgers University.

The annual turkeymen's dinner will be held in the Governor's Room at the Hotel Penn-Harris. It promises to be a treat with Warren Johnson, Nottingham, Pa., as chairman, and Dr. Kenneth Hood, Penn State agricultural economist as toastmaster and speaker.

The NEPPCO Exposition and Convention for 1951 has shaped up as a grand and highly profitable contribution to the poultry industry, a "must" for every poultryman.

## How Johnny gets his breakfast (lunch and dinner, too!)

Johnny's eye roves the breakfast table hungrily. Up early this morning for a big breakfast, he'll get it—thanks to the most productive agricultural system in the world and to America's railroads.

As Johnny downs his fruit, he doesn't stop to think about the orderly system of getting fresh fruit to him from far-distant orchards and groves—or the railroads upon which such a system depends.

As Johnny wolfs his cereal—he doesn't consider the vast fields of grain, the towering grain elevators, the great flour mills—or the railroads which connect them all.

As Johnny tackles his bacon and eggs and his glass of milk, the farmer-railroad team is busy growing, harvesting and "assembling" millions of other meals for other Johnnies all across the nation.

Every day the nation's railroads move to the farms thousands of carloads of agricultural supplies. And every day they carry away more than 10,000 carloads of agricultural products—moving an average distance of more than 500 miles—so that Johnny and everyone else can get the food they need to be healthy and strong!

Listen to **THE RAILROAD HOUR** every Monday evening on NBC.

By J. F. "Doc" ROBERTS

**L**IVESTOCK prices are continuing to go lower. Retail meat prices (ceilings) have been set too high. Farmers, livestock raisers, processors, as well as packers, are again caught in the "squeeze."

The situation is about like this: Meat is piling back (not moving out) for the wholesaler, so he has to reduce his price in order to move it, and he must then buy it cheaper from the farmer. The retailer has his price set, so he simply goes along at these ceilings even though he sells less meat. Thus the consumer gets no benefit of the lower prices and therefore does not use an increased amount of meat. This deplorable situation could not exist under natural laws of supply and demand.

Without "controls," we have flexible prices which change rapidly all down the line with differences in supply and demand through competition. With "controls," a "justifiable" price is set under the conditions of that time, but with no flexibility, you have no price changes at the retail or consumer end even though conditions are forever changing. Then you have a situation as of today when everyone except the consumer has more than enough meat, and the farmer and packer are caught in the "squeeze."

This has come about through a normal increase in livestock receipts the country over at this season of the year. Removal of government killing quotas at 80% of last year's kill has also made it possible to get rid of black marketeers, because legal packers could handle and distribute this supply. If the Administration has its way and these quotas are again put on legal packers under increased livestock receipts, we will have chaos for the entire livestock industry. Even with continued ceilings at the retail end, the present bad situation will get worse as we get into heavier and heavier fall runs of livestock.

On top of all this, hide, pelt and fat prices have broken almost in half since ceilings were put on carcass meat. Not until this week was any account made of this drop by the people who put the ceilings on in the first place. The drop had to be all taken up by the man who was furnishing the live animals (the farmer), necessarily at lower and lower prices. The flexibility (rapid price changes) all along the line, to make everyone share in a break of this kind, just can't seem to come through the red tape of "controls."

\* \* \* \* \*

There seems to be two distinct lines of thought among livestock men on future livestock price trends. One is that with all the demand, and all the feed and money available, prices cannot go lower on livestock this fall or early winter. The other thought is that prices will be lower the early part of the winter because livestock prices have been and still are too high, and therefore any increase in supply will break prices. As they say at the Fairs—"Take your pick and have your choice."

Personally I am inclined to favor the latter guess because I do anticipate increased supplies, particularly hogs, but I am quick to add that any reduction in supply (numbers of livestock marketed), whether now, next winter, or next spring, will cause higher prices. Also under present conditions of "controls," prices are gummed up and will probably continue to be. If supplies shorten up during this winter, we will have higher livestock prices immediately—controls or no controls, war or no war.

### BEEF FOR BEGINNERS

Many farmers are inquiring about starting a beef program. Here are some points that should be kept in mind:

1. It will usually be advisable to plan the beef program as a supplementary or companion enterprise. In many cases it will combine well with cash crops, fruit, poultry, dairying and the like, and help balance the labor program.
2. Keep the investment in buildings and equipment to a minimum.
3. Beef cattle should be considered as a market for home grown feeds. Plan for adequate pasture throughout the grazing period.
4. Start with good quality breeding stock. It costs just as much to feed and care for mediocre or poor cattle as it does for the good ones.—M. D. Lacy  
—A.A.—

### DAIRY CATTLE PRICES GOOD

An active, large bidding crowd paid the most dollars yet at the regular Earlville, N. Y. sale on Wed., Aug. 29 when 155 Registered Holstein cattle brought \$69,235 to average \$439. The 108 milking animals averaged \$490 and the 22 bulls averaged \$336. Cattle were consigned by 71 breeders and taken by 78 buyers from 22 counties in New York State and also from Maryland, Mass. and Conn. 49 cows, either as individuals or with their calves brought from \$500 to \$820.

The quality was excellent—one of the nicest all the way through offered in a regular Earlville sale in a long time. Morton Treadwell, Schoharie Co., sold his herd to average \$450; John Weatherwax, Troy, N. Y. sold his herd to average \$539 and John Kimker sold a group to average \$525.

Sale was managed and auctioneered by R. Austin Backus, Mexico, N. Y.

—A.A.—

It has been estimated that without present-day commercial fertilizers, at least 50 million more acres of productive land would be needed to feed and clothe the population of the U. S.

## Here Comes Fall!

By MABEL HEBEL

**S**EWING at home is the perfect answer to balancing the clothes budget, yet having all the latest styles. On this page you'll find a collection of fashions suitable for every use—college, career, school, and home. This season you'll see two silhouettes—one full skirted and full of curves; the other built on straight but released lines. All details fit into this more feminine mood of fashion.

Many styles have long tight sleeves and a high neck. Walking ease in the "straight but released" skirt style comes from panel pleats, side pleats, or a slight flare. Suits are shaped, most often in thin crisp fabrics which have the suppleness needed to be easily molded into a curving silhouette. With the return of the fuller skirt comes the new swinging separate skirt—padded, stiffened slightly beneath by lining, worn over crinoline petticoats.

Crisp fabrics are popular for casual as well as special occasions. Rayon resembles worsteds, and even cotton comes with a crisp worsted look in plaids and stripes. Basic wool jersey is being "styled up" too, with contrast

tones or contrasting fabric (such as velveteen or braid) for trim.

Make a circle skirt in taffeta—wear it over a crinoline petticoat for the important crisp look! No. 2450 is especially easy to sew; only four seams and waistband to attach.

Scalloped blouse No. 2472 has the simplicity that blends nicely with crisp skirt fabrics. Its round yoke lines look neat beneath jacket lapels, too.

Latest diagonal lines (buttons swerved to the side) form interest for sleek but soft casual No. 2555. Its flared skirt styling is favored for college and career girls.

Soft dress No. 2527 could be your basic choice. Scroll trimmed neckline is new; also the shoulder pleats which bring easy blouse to the bodice. Short cuffed sleeves included.

No. 2558 is another interpretation of the season's styled-up casual. It's neat looking but features panel-pleats in front for fullness without bulk. Short sleeves, too.

Many-purpose shirtwaist No. 2373 has comfort as its aim—see the way pleat detail releases bodice fullness. (Continued on Page 21)

# My Window Boxes Bloom All Year

By Florence J. Johnson

WHEN frost has nipped my summer flowers and delicate greens, I do not take my window boxes down. Nor do I leave them up, bare and discouraging to those going by, as well as to those inside the house looking out.

I replant them—not with sensitive plants, but with sturdy branches of evergreens. Then with ropes of, cranberries and popcorn, bits of suet fastened to the branches, small orange cups, shellacked for winter protection, filled with seed and hanging on the branches, my window boxes are ready for their crop of flowers.

They are not long in coming. As soon as word gets around, my window boxes become alive with vibrant colors. Browns and blacks and smudgy grays with a touch here and there of bright scarlet as the winter birds come seeking the food they have heard is waiting for them.

At first they are shy and fearful as they see human beings on the other side of the window pane. Gradually, seeing that they are not molested, they become braver and only cock a questioning eye at the person who stands watching them. But I have found that they are happier and eat more contentedly, if we admire our living "winter flowers" at a distance.

So when the cold, crisp days come, your window boxes, once fragrant dreams of summer colors, now drab and unappealing, can become visions of winter glory with bits of evergreen, a supply of food, and visiting feathered guests.

P. S.: Have on hand a good illustrated bird book. You will need it.

—A.A.—

## HERE COMES FALL!

(Continued from Opposite Page)

So many ways to make this dress—with wide collar or collarless neck, or short or long sleeves.

No. 2595 provides a quick and easy way to enlarge a wardrobe. Make the skirt and two trim weskit tops. Then mix and match, team with other separates, too.

No. 2521 is a soft shoulder dress designed with the half-size figure in mind. Choice of neckline and sleeve length.

Ensembles are practical for all ages, and your daughter's could be No. 2278—a bolero effect dress, a winter-warm hooded coat with heart shape pockets. Both are sewing time-savers.

No. 2366 is one of those neat dresses all schoolgirls need. Topped by a thrice scalloped yoke, it's nice as a long sleeve rayon or wool, as well as a short-sleeve cotton.

A three-piece ensemble with true grown-up styling—No. 2296. The pleated jumper and high-button jacket could be made Scotch style or in sturdy corduroy. Peter Pan collared blouse is a companion piece.

Add Scotch hat No. 2952 to a little lassie's clan costume—it takes a minimum of material and sewing time, ribbon streamers and all!

No. 2470 is the newest two-way jumper. This tailored, easy-to-don style can be worn without its blouse (short and long sleeved) as a dress when you wish!

Two-piece No. 2417 is the kind you can sew in many fabrics: from sheer worsteds and crisp rayons to dressy faille. Its trim but feminized jacket with nipped-in waist offers choice of neckline and sleeve lengths.

### PATTERN SIZES AND REQUIREMENTS

No. 2278—1, 2, 3, 4; size 2 dress, 1 3/8 yds. 35-in., 1/4 yd. 27-in. contrasting, 5/8 yd. ruffling. Embroidery included. Hooded coat, 1 3/8 yds. 54-in.

No. 2296—2-8; size 4 jacket, 1 1/4 yds. 35-

in. Jumper, 1 3/8 yds. 54-in. The blouse, 1 1/8 yds. 35-in.

No. 2366—6-14; size 8, 3 1/4 yds. 35-in. or 2 1/4 yds. 54-in.

No. 2373—12-20, 36-48; size 18, 3 1/4 yds. 54-in. or 4 3/8 yds. 39-in.

No. 2417—12-20, 36-48; size 18, 4 1/2 yds. 39-in. or 3 3/8 yds. 54-in.

No. 2450—waist sizes 22-32; size 28, 4 3/8 yds. 39-in.

No. 2470—12-20, 36-44; size 18 jumper, 2 3/8 yds. 54-in. Blouse, 2 3/8 yds. 39-in.

No. 2472—10-20, 36-40; size 16, 1 1/2 yds. 39-in.

No. 2521—in half sizes only, 14 1/2, 16 1/2, 18 1/2, 20 1/2, 22 1/2, 24 1/2. Size 16 1/2, 3 3/8 yds. 39-in., 3/4 yd. ruffling.

No. 2527—14-20, 36-48, size 18, 3 3/4 yds. 39-in.

No. 2555—9-19; size 13, 4 3/8 yds. 39-in., or 3 1/4 yds. 54-in.

No. 2558—14-20, 36-48; size 18, 4 1/2 yds. 39-in., 3/4 yd. 35-in. contrast.

No. 2595—12-20, 36-44; size 18 skirt, 1 1/2 yds. 54-in. Cap sleeved weskit, 1 1/2 yds. 54-in. Sleeveless weskit, 1 3/8 yds. 54-in.

No. 2952—head sizes 19-22; in any of its sizes, 1 1/2 yd. 18-in., 1/2 yd. ribbon.

TO ORDER: Write name, address, pattern size and number clearly. Enclose 25 cents for each pattern wanted. Add 25 cents for our new Fall-Winter Fashion Book which has up-to-the-minute fashions for every member of the family and every occasion. ## YES, WE HAVE AN A.A. COOKBOOK!

I have clipped and saved many American Agriculturist recipes, but I think it would be nice if you got out a cookbook and put in it some of your wonderful recipes, including those of Grange baking contest winners. Maybe you have such a cookbook. Please let me know.

—Mrs. S. P., New York.

YES, we do have an AMERICAN AGRICULTURIST cookbook! It was published on January 1 of this year, and contains over 600 of our best recipes—including the latest Cornell canning guide and Grange contest winners' recipes. We think that no other cookbook on the market is so right for farm families. The price is just \$1.95, and the book may be ordered from AMERICAN AGRICULTURIST, Box 367-CB, Ithaca, New York.

—A.A.—

YOU can dress up your bedroom effectively and inexpensively by making this attractive bedspread, curtains, and vanity skirt set. Instructions No. E-1601 are complete. To order, send 15 cents in coins to Needlework Department, AMERICAN AGRICULTURIST, 10 North Cherry St., Poughkeepsie, N. Y. Add 15 cents for new Needlework Book.

## What Makes Mealmaster The Range

FOR YOU?

**Mealmaster Gives You . . .** your choice of two great combination ranges. The Coal-Electric Combination Range or the Oil-Electric Combination Range. Both ranges cook, bake and heat with either fuel or both fuels at the same time.

**Mealmaster Gives You . . .** an oven that is completely insulated on all sides with two inches of Fiberglas. Bakes with either fuel using thermostatic control to give you accurate baking temperatures.

**Mealmaster Gives You . . .** a forced warm air unit at the base of the range to give you room heat for kitchen comfort. Another extra feature you find only on Mealmaster Combination Ranges.

**Mealmaster Gives You . . .** the "Miracle Dial" that enables you to choose the fuel you want to use for baking at the flip of a finger. No fuss . . . no bother . . . no mess when you change fuels.

**Mealmaster Gives You . . .** four fast dependable chromalox surface units. Seven different cooking temperatures are available with each unit. Chromalox units are designed for easy cleaning too.

NO REPAIR BILL WORRIES WITH A

**SPEED****QUEEN****WHAT THEY SAY**

I like my Speed Queen washer because in the sixteen years that I've had it, I've never had any trouble with it, except three new rollers put on the wringer and a new crank. I like my Speed Queen for its double wall tub, as it keeps the water hot longer. In the sixteen years, I have washed for a family of nine.

MRS. CLARENCE BAMMANN  
Girard, Kansas

In 1935 I bought a Speed Queen washer and used it continuously until November 1950. At that time I bought a new Speed Queen. With the old machine I did the washing for a family of 13, and always found it ready to go. Any manufacturer who puts out a machine with the quality of the Speed Queen deserves a pat on the back.

MRS. E. J. DESAUTELS  
Michigan, N. Dakota

**WHAT THEY SAY**

I was so pleased with the service and the way my Speed Queen did the washing for my large family of growing farmers during the past fifteen years, that I have now purchased a new Speed Queen, one with a stainless steel tub, which I think is super.

MRS. ODIEN FLAAGEN  
Pekin, N. Dakota

I have had a Speed Queen Washing Machine for the last 17 years. It has been a real help all these years with a minimum of upkeep, and still doing a good job. The only replacement, which cost us 45c, was the small brass ring on the agitator post. For fine clothes as well as heavy garments and rugs, it is unsurpassed in economic upkeep and cost of operation. Your new machine is beautiful, and if it gives the service the machine I have is giving me, one could wish for nothing finer.

MRS. J. LIEBERMAN  
Cleveland, Ohio

**DOUBLE WALLS**

to keep water hot  
Speed Queen's double-wall tub not only keeps the water hotter to turn out a cleaner wash, but the outer steel wall also protects the porcelain tub inside. Most washers have just a single-wall tub — yet cost just as much or more than a double-wall Speed Queen.

There are 5 Speed Queen washer models to choose from. Your Speed Queen dealer will be glad to show them to you. For free literature describing all models, write the Speed Queen Corp., Ripon, Wis.

# Make a Variety of CATCHUPS

By **BLANCHE CAMPBELL**

THERE is no need to confine your catchup making to tomatoes alone. Although tomato catchup is very delicious, you'll find these other catchups quite a welcome change and equally as good.

Their flavor is tangy, tasty, and will add zip and zest to your meals. After you have tried these, never again will you fall into the rut of making just one kind of catchup.

**GRAPE CATCHUP**

2 pounds grapes  
2 cups sugar  
¼ teaspoon salt  
1 cup vinegar  
1 teaspoon whole cloves  
1 teaspoon whole allspice  
2 3-inch sticks of cinnamon

I like concord grapes best for making this catchup. Wash grapes and remove them from the stems. Place them in a pan and steam them in the deep well cooker or double boiler without any water until the fruit is soft. Rub grapes through a sieve. To the pulp add the sugar, salt, and vinegar. Tie spices in a cheesecloth bag and simmer all together until it reaches the consistency of catchup. This will take from 25 to 30 minutes. Pour into hot sterilized jars and seal. I use the little half pint jars for this as it makes about the right amount to open and use at once. This amount will fill 3 half pint jars.

**GRANNY'S CUCUMBER CATCHUP**

Ripe cucumbers  
2 onions, chopped fine  
1 red pepper, chopped  
1 cup sugar  
½ teaspoon cinnamon  
¼ teaspoon black pepper  
2 cups vinegar  
½ teaspoon salt  
1 teaspoon cloves

Peel enough ripe cucumbers to make one quart after seeds and soft centers have been removed. Combine with onion and pepper and stir well. Add sufficient water (about 1 cup) to prevent sticking while it cooks to the right thickness. Simmer slowly, stirring frequently until tender. Then add remaining ingredients and continue simmering until thick. Seal at once into hot sterilized jars. Makes 2 pints.

**CRANBERRY CATCHUP**

2 pounds cranberries  
1 cup water  
2 onions  
1 cup vinegar  
2½ cups sugar  
1 tablespoon ground cloves  
2 teaspoons cinnamon  
2 teaspoons allspice  
1½ teaspoons salt  
½ teaspoon pepper

Look over cranberries and wash. Add water and cook until tender. Rub through a sieve. Peel onions and put through the food chopper, using fine knife. Add all the remaining ingredients and cook slowly until thick like catchup. Stir occasionally to prevent it from sticking. Pour into sterilized jars and seal. Makes about 2 pints.

**APPLE TOMATO CATCHUP**

3 sour apples, cored and diced  
7 pounds ripe tomatoes  
1 pound peeled onions  
4 small peeled garlic buds  
1 cup water  
1 tablespoon salt  
¾ teaspoon pepper  
1 cup brown sugar  
1 teaspoon celery seeds  
1 teaspoon whole mustard seeds  
½ tablespoon whole allspice  
1 tablespoon whole cloves  
1 3-inch stick cinnamon  
2½ cups white vinegar

Simmer the apples and tomatoes, covered, until soft, then press through a coarse sieve. Cook the onion and garlic together in the water, covered, for 20 minutes. Strain through a coarse sieve and add to the tomato pulp. Add salt, pepper, and sugar. Put spices in a cheesecloth bag and add. Simmer

slowly, uncovered, for 40 minutes, stirring occasionally. Then add vinegar and finish cooking, uncovered, until it is

**INEVITABLE EVENT**By *Eleanor Alletta Chaffee*

This is the day that Jonathan  
Goes to the nursery school.  
His chest is swelling with manly pride,  
His eyes are wide and cool.  
His mother is more distraught than he  
On this red letter day:  
What will she do in an empty house,  
With Jonathan away?  
The gate clicks shut with a final sound  
Like the striking of a clock,  
And time stands still until the stroke  
Of noon brings Jonathan's knock.  
Bubbling with news, he fails to see  
Behind the sparkling joy  
In his mother's face, the soft farewell  
To a Very Little Boy.

of the right consistency. When it reaches just the right thickness, remove spice bag and pour at once into clean, hot sterilized jars. Seal. Makes 2 pints.

**APPLE CATCHUP**

8 cups thick unsweetened applesauce  
2 teaspoons cinnamon  
2 teaspoons cloves  
2 teaspoons dry mustard  
1 onion, minced fine  
1 tablespoon salt  
1½ teaspoons black pepper  
1 quart vinegar

Combine all ingredients and mix well. Simmer slowly until thick and of the right consistency. Seal in hot sterilized jars. Makes about 1½ quarts.

**GREEN TOMATO CATCHUP**

10 pounds green tomatoes  
5 pounds white onions  
Salt  
4 tablespoons mustard seed  
1 tablespoon allspice  
1½ cups brown sugar  
1 tablespoon cloves  
½ tablespoon dry mustard  
¼ cup water  
2 teaspoons black pepper  
1 tablespoon celery seed  
3 cups vinegar

Put tomatoes and onions through the food chopper, using the fine knife. Sprinkle with salt and let stand over night. The next morning drain well and combine with spices, sugar and water. Then cover with the vinegar and simmer slowly 1 hour. Seal in clean, hot sterilized jars. Makes about 4 quarts.

— A. A. —

**EAT THESE FOODS EVERY DAY**

A simple guide for meeting the nutritional requirements for your family is to choose foods daily from the following groups:

1. A green or yellow vegetable. (Either one, or both.)
2. A citrus fruit in some form, or tomato juice.
3. At least two other vegetables and fruit besides potato.
4. A quart of milk for children, and at least two to three cups for adults.
5. One or two protein foods, such as meat, fish, or eggs.
6. Whole wheat or enriched bread, and cereals.
7. Table fats, including butter and fortified fats, as well as other regular cooking fats.

— A. A. —

When it comes to a cookbook for farm families, you can't beat, "A Treasury of Country Cookery"—*American Agriculturist's* new cookbook. It's a collection of the most popular recipes that have been published in A.A. Price, \$1.95. Order from *American Agriculturist*, Box 367, Ithaca, N. Y.

## SOUNDS On the Farm

By MARGARET C. AIKENS

**D**ID YOU ever stop to think about all the things you can hear on a farm that you seldom see? Many of the sweetest singing birds are dull in color and stay in the tops of the highest trees, so that we hardly ever see them, but we hear them. Then, there are sounds that carry for long distances, like the drumming of the partridges, the "Chug-a-rum" of the bullfrogs, and, in winter, the lonesome hoot of the owls and the bark of the foxes. We seldom see any of these, yet in their own way they are part of our lives.

Why not make a collection of the sounds of the farm? You might be surprised at how many things you have listed that you only heard and never saw.

Some sounds you may have trouble identifying. One that took me a long time to figure out was the song of the Eft (more familiarly known as little red lizards). I used to think it was a bird that I heard, and I kept looking up into the trees for it. Finally, I learned what it was, but I still have never seen an Eft singing. They are silent when I catch them.

I have seen a toad singing. His throat was blown up like a soap bubble and he was trilling for dear life.

We mustn't forget the insect songs. Cicadas (sometimes called locusts) are a familiar part of the hot summer days with their shrill, whirring songs. The chirping crickets become so familiar we hardly hear them. The bees buzz happily when they are collecting pollen, but did you ever notice how excited they sound when they swarm?

One night in the autumn I heard a noise unlike any I'd heard before. When I described it to my brother, he said it probably was the bark of a deer. It sounded more like a frog to me. It is sounds like these that make the background music on a farm.

**PRIZE WINNER:** Having a baby to look after didn't keep young Mrs. Frederick Bouton of Halcott Ctr., N. Y., from baking the cake that won top honors in the Greene County Pomona Chocolate Cake Contest. Mrs. Bouton is Lecturer of Greene Valley Grange and will compete in the chocolate cake contest finals at State Grange this fall. The statewide baking competition is sponsored jointly by AMERICAN AGRICULTURIST and the New York State Grange. Other recent county winners are Mrs. Grace Hagar of Plattsburg, N. Y., Clinton County, and Mrs. Dorris Bowers of Lockport, N. Y., Niagara County.

## WHAT'S GONE BEFORE

Mark Wilson is reported killed in the Battle of Fredericksburg. Ann, his wife, is so grief-stricken that she becomes indifferent to everything, and is persuaded by her mother and Henry Bain, a neighboring farmer who holds the mortgage on her family farm, to marry him. Bain is a Copperhead, who switches his sympathies to the winning side when it becomes evident that the South is about to lose the war. Lee surrendered to Grant on April 9, 1865, and the men returned home, including Mark Wilson, who has been imprisoned in Andersonville Prison for years. His shock on discovering that Ann has remarried is overwhelming.

## CHAPTER XXVII

IN THE way that gossip always gets around, everybody in the neighborhood soon knew that Ann had separated from Henry Bain the very day that Mark Wilson came back. But it was not until Ann learned that Mark was unconscious and so ill that he would not know her that she dared go over to the Wilson house to find out from Nancy exactly how he was, and to greet George and Charlie (and meet Charlie's young wife, the slender, lovable girl from Virginia.)

Mark's condition had grown rapidly worse, and when Nancy, with tears in her eyes, told Ann that he wavered between life and death, Ann asked her, humbly:

"Nancy, could I see him? He won't know me, and I'll be very quiet so it won't hurt him."

"Of course, my dear," said Nancy, quickly. "Come with me."

They went up to the little bedroom that had been shared by the three boys before the war. It was hot up there, but the doctor had advised against moving Mark to the downstairs bedroom at this critical period of his illness. The grief-stricken girl stood looking down on the skeleton-like form outlined under the single sheet on the bed, and then, moved by an irresistible impulse, she suddenly went over and knelt on the floor, taking the wasted hand in both of hers. For a moment the muttering, twisting and turning ceased, and then started again.

Nancy went downstairs and left them alone. How long Ann knelt there she never knew, but when Nancy came upstairs again Ann had to be helped to her feet and into a chair until the circulation returned to her legs. Then she and Nancy tiptoed out of the room and down the stairs.

"You're going to need help, Nancy," Ann said. "As long as he's unconscious and doesn't know me, do you think I could stay?"

Too emotional to trust her voice, Nancy nodded.

Then followed days and nights with Ann almost constantly at Mark's bedside, sleeping little and eating only because she had to keep up her strength. When she was with Mark, he seemed to be easier and rested more quietly, but still his hands moved restlessly across the sheet and he muttered frequently, with only a word now and then that Ann could understand. In his delirium he always seemed to be struggling to get somewhere—probably out of prison, Ann thought, and home again. Two or three times he called her name, startling her so much that she thought he had returned to sanity.

But gradually after a time Mark be-

came quiet, especially under the touch of her hands. The doctor was more hopeful. The crisis was passing. He was sure now that Mark would get well in spite of his greatly weakened resistance.

Finally, one afternoon as Ann sat in a chair at his bedside and with her hands gently stroked his forehead, Mark opened his eyes and looked directly into her face. She couldn't restrain a little cry, for she could see that he was completely conscious. At first he looked puzzled as if he didn't know where he was, or why, and she said, softly:

"Mark, darling!"

Suddenly he remembered everything, and after looking attentively at her for a moment, he said nothing and slowly turned his face to the wall. His rejection of her was like a knife stab in Ann's heart. Rising quickly, she went out of the room to tell Nancy that Mark had regained consciousness, and that she had better go to him. Then the girl went back down the road to her own home, feeling more alone and forsaken and heartbroken than she had ever felt before in her life.

During the next few days Ann continued to visit Nancy to inquire about Mark, but she did not go upstairs again. Nancy, understanding, did not urge her, and Mark did not ask for her.

Mark's convalescence was painfully slow, and the first time he was allowed to come downstairs, the family celebrated in their own special way. On the back stoop of the Wilson farmhouse was a big farm bell which Nancy had

used for years to call the men from the field to their meals or when they were needed for some farm emergency. But the bell also played another important part in the lives of the Wilsons, for it was their custom to ring it long and loud when some big and happy event occurred in the family. The bell had been rung when the men had come home on furlough from the war. It had not been rung when Mark came home because he was so sick, but one day late in that summer of 1865, Mark was helped downstairs for the first time, almost carried by his father and brothers, and deposited with quilts wrapped around him in the big rocker by the pleasant kitchen window. That was indeed an event to be celebrated, and celebrated it was by a loud and prolonged ringing of the old farm bell.

But the enthusiasm of the family soon passed, because their own happiness found no response in Mark's sad eyes and grave face. In the days that followed, he sat for long hours gazing out across the farm fields, saying nothing. They all knew what was the matter, and one day when Nancy had stood it as long as she could, she went to Jenkstown to talk it over with Timothy Belden.

"Mark isn't doing as well as he should," she told the old minister. "We have him downstairs now, but he takes little interest in his vittles, and he's still not sleeping well. We're all worried. Of course, you know why he doesn't improve. He is very much in love with his wife, and he can't reconcile himself to the situation. He's eating his heart out because he thinks Ann was disloyal in marrying a man whom he detested."

"Have you tried to talk to him?"

"No," she said, "I never could, and he wouldn't listen. I thought maybe you could."

For a long time the old man sat toying with a heavy watch chain that reached from one vest pocket to the other. Then he spoke:

"One has to live such a long time before we know very much—and I'm not sure how much we know even then," he added, whimsically.

Nancy looked a little puzzled.

"You're old enough, Nancy, to know

what I mean. It's the heart and the spirit that count, not the body. It's hard for a young man to understand that. What a person does under the awful stress of circumstances doesn't really matter. It is easier for an older man to understand that what does matter is what the girl is at heart, and how she feels now, not how she felt or did a year ago.

"You're an understanding woman, Nancy. You and I know the terrible strain that Ann went through. We know and understand why she yielded to Bain's importunities and married him. Like you, I've known her ever since she was born, and no finer person has ever lived in this neighborhood. I believe you when you say that her love for Mark has never changed and is even finer today after the fire she has been through than ever before. Our problem, of course, is to get our tolerance and understanding of the facts and the true situation across to Mark."

He fell silent again for a time, then said:

"I don't know how much good it will do, but I'll talk with Mark."

Nancy stood up, her face softened with affection for the old minister.

"I don't know what the world would do without men like you," she said as she went out.

A few days later the Pastor's buggy stopped at the Wilson door, and the old minister persuaded Mark to take a ride with him. As soon as they were on their way, the minister came directly to the point:

"Perhaps you have guessed, Mark, why I asked you to ride with me today?"

"If it's about Ann," Mark answered, "then I'd rather not talk about it even with you."

"All right," Mr. Belden agreed, "you just keep still for a little while and let me talk. I think I have the right to talk to you, not as your pastor, not as the man who married you to Ann, but as a friend who has known you and Ann and all of your people a long lifetime. There is much at stake, Mark, and, frankly, even if you don't want to consider your own happiness, you do have some obligation to consider the happiness of others."

"Some of them don't seem to have had much consideration for my happiness," said the boy, bitterly.

"Well, that's just what I want to talk with you about. I think if you thoroughly understood all that has been involved, you might feel differently. Anyway, you owe it to yourself and to the rest to face the facts. Then, of course, the final decision must be yours."

"I know the circumstances under which you left for the war the last time," the pastor went on. "Not from Ann, but from the other best friend you have in the world, your mother. And, again very frankly, Mark, you weren't without fault in the cavalier way you left your young bride."

"I know that!" Mark answered. "And I apologized for it."

"There are some things," the old man said gravely, "that cannot exactly be washed out by a few words of apology. This came pretty close to being one of them."

They rode in silence for a few minutes, then Mr. Belden went on:

"I've married a good many couples, Mark, and it's the privilege of a minister to come close to many lives. I have never known a girl to be any more in love than Ann was—and is, with you."

Mark stirred uneasily on the buggy seat, but said nothing.

The minister slowed the horse down to a walk and after a moment continued:

"Ann haunted the post office to get your letters, and she worked hard and long on her farm against the day of your return. The farm was one of the chief troubles."

## NO DRUMS

(Continued from Opposite Page)

"Yes, I know."

"I'm pretty sure you are feeling that Ann lacks stability and acted irresponsibly, but it's a curious fact that all the trouble resulted because she had too much responsibility. She wanted to keep the farm for her father and mother and to have something of her own when you came back."

Mark made no remark, and the old man gently slapped a line against the horse's hip to drive off a big horse fly.

"Then," continued Mr. Belden, "after a long time of agonizing waiting and watching, the blow fell, and Ann and the rest of us got the report that you had been killed. Perhaps if you had been killed, your spirit would have understood what that blow meant to your wife. Perhaps we may say that she lacked judgment in marrying Henry Bain, for some of us have long known that he is a scoundrel."

Mark started to speak, but the minister laid a restraining hand on his arm:

"Just listen, please, and try to understand. Here was a girl, so shocked that she almost lost her reason. She became utterly indifferent. Nothing really mattered. In all kindness, let us say as little as possible about her mother. To be as charitable as possible, let us say that Mrs. Clinton has always had a hard life and is a worrier. So perhaps it was natural, with you reported dead, for her to seek security for her husband, herself and her daughter by influencing Ann to marry Bain."

"On his part, clever scoundrel that he is, Bain seemingly became everything that a friend should be, always around, always apparently kind."

Again Mark stirred impatiently. "If you don't mind," he said, "let us leave him out of it."

"But I do mind," insisted the minister. "It's impossible to leave him out. You've got to understand. Let's put it this way. You don't care much what happens to yourself right now, do you?" Well, that's exactly the way Ann felt. The very intensity of her love for you made life so hopeless that nothing mattered. So, when Bain offered to marry her, in her mistaken judgment, she thought how kind and good he had been during her grief and that it would be a solution to the problem of her mother and father. Bear in mind all of the time, Mark, that all of us thought you were dead and long since gone."

"As time went on, Ann realized her mistake. She found out—and her mother, too—what Bain was really like. But that girl of yours, my boy, has character. When she gives a promise, she expects to keep it. And she was determined to be a good wife even if he wasn't a good husband."

The old voice ceased. The silence became oppressive, broken only by the sound of the rolling buggy wheels and the footsteps of the horse. But Mr. Belden had not finished.

"When you came back, what happened?" he continued. "That very night Ann sent Henry Bain packing, tremendously relieved that all her obligations to him were completely cancelled, even though she realized that her relations with you might never be resumed. Then came your sickness. She took care of you night and day until you came back to consciousness and rejected her. That sort of love, my boy, is the most precious thing in God's world, too precious to be cast aside for foolish pride, jealousy, or anything else."

Turning to look at Mark, the minister was pleased to see tears rolling down the boy's face. Finally Mark said, brokenly:

"How can I go to her thinking all of the time that she, my own bride, lived with another man?"

The minister slipped an arm across

the thin shoulders.

"Mark," he said, "I understand how you feel. Any man would have some of the same feeling at your age. But it really doesn't matter. Ann never loved anybody but you. When you and she stood before me in our church—it seems so long ago, but it really isn't long—she gave herself to you spiritually as well as physically, and I say to you truly, as your friend, as one man to another, as an old man speaking with some experience of human nature, that that kind of love never changes. She was your wife then, she was your wife even while you were away, and, my boy, she is your wife now."

That evening Ann heard an unsteady step coming on to the stoop. Her heart told her who it was, and when she rushed to open the door, she found Mark standing unsteadily before her. She stepped back a little, uncertain, while he came in and stood with his hands gripping the back of a chair until his knuckles showed white.

"Ann," he said hoarsely, "a long time ago I went away from you without even saying goodbye. But now I've come home to you again."

He swallowed, and added:

"If you'll have me, dearest."

Ann reached for him, pushing the chair out of the way, and drawing him

to her breast and holding him tight, she whispered:

"Oh, my darling, thank God we are both home at last!"

### "TREE CROPS" BY J. RUSSELL SMITH

According to Bernard Baruch, 'Any one with a plot large enough to plant a tree will be interested in reading "Tree Crops" by J. Russell Smith.' In this book you will find discussed every important variety of nut tree, as well as the right tree for your soil, your climate, your local conditions. Dr. Smith has much to say about experiments that every farmer can and should try out in tree management, crossbreeding and fertilizing, and on soil conservation and a wealth of other practical topics. Not the least interesting part of the book, also, are the photographs; in fact, if you don't have time to read all of the text, you will get the essence of the book from the pictures and legends. The publishers are The Devin-Adair Company, 23 East 26th Street, New York 10, and the price is \$6.00.

## It Calls for Compliments!

It's made with DAVIS "double action"

### 1-EGG CAKE

#### STEP I

1 1/4 cup Cake Flour  
1 cup Sugar  
3/4 tsp. Salt  
1/3 cup Milk  
1 Egg

1/3 cup Shortening (emulsified type such as Crisco, Spry or Swift's) 1 tsp. Vanilla

Combine and beat smooth (2-3 minutes)

#### STEP II

2 3/4 tps. DAVIS BAKING POWDER

#### STEP III

1/2 cup Milk

Stir in quickly Blend gradually into batter; then beat for 1 minute

Bake in two 8-inch round pans for about 25 minutes at 365°F Frost with Swel — chocolaty, creamy-smooth — another Davis product.

Try this quick-mix 1-egg cake. It's so easy! And Davis Double Acting Baking Powder gives it lightness and texture you'll be proud to sponsor! Double action means: the batter rises twice—first in the mixing bowl and again in the oven. That means super-lightness—even when you're delayed getting it in the oven. Try it! Send for set of "Quick-Mix" Charts: R. B. Davis Co., Dept. AA-7 Hoboken, N. J.

GIVES A LIFT TO YOUR BAKING

The World's Most Delicious Chocolate Cakes

are made with

Walter Baker's Premium No. 1 CHOCOLATE

# KERNELS, SCREENINGS and CHAFF

## SUNNYGABLES NOTES

By John B. Balcock

**J**UST wait till times return to normal.

That is one of the most worn phrases used today as farmers, businessmen and industrialists face the uncertain future. This year is probably marked by as much insecurity as any we ever faced. It's tough to make plans. We all yearn for what we call the "good old days" when a fellow could look forward, make his plans, and come out about as he thought he would.

But just what are "normal times"? Every one of the past ten years has been marked with one crisis after another. We adjusted ourselves to war, attempted to adjust ourselves after the war, and are now waiting breathlessly for a decision on another war—maybe not a full-fledged war, but as close to one as you would want to be if you happened to be one of the boys fighting in the Far East.

1910-1914 is often cited as a period of normalcy, and parity figures are still based on that period. How many of the older men can remember calling those years normal while they lived through them? And the latest period picked as normal is 1935-1939. None of us sat complacently by during those years, calling them normal.

About the only sensible solution for a farmer is to keep on producing crops, milk and livestock like he always has. No matter whether the period is referred to in history as normal or not, the fellow who works a little harder, and produces a little more efficiently, will make out just a little better than the run of the mill.

About all we can do is stay on our toes, ready to shift plans and accept new circumstances at any moment. And maybe in a fast-moving, ever-changing country, times right now are normal . . . they are *always* normal.

### BOOTS SHIFTS PLANS

**A** FEW years ago, Boots sold out his milking herd and started the long job of building back herd numbers. This summer, with a milking string of better than 30 cows, he again liquidated a good many of his milking cows and is starting a new crop of young stock, many of which he raised, and some of which he bought and is buying.

### Not Out of Business

Boots does not plan to abandon the dairy business—nor was his liquidation of the herd a step taken in haste. Believe me, in spite of good prices, it is no easy task for a man to stand by and watch the very cows he has raised and milked leave one by one. Yet, looking at the future of his own dairy enterprise, both Boots and I feel that he made a good move.

### Why Sell?

Speaking in general terms, this is no time to get out of the dairy business, particularly if you are well established or growing at a good rate. The reason

Boots moved part of his herd was due to circumstances at his farm that would not apply every place. Let's look them over.

First, Boots was short of help. The young fellows around the farm who showed promise of making farmers of themselves were all on pins and needles sweating out Uncle Sam's beck and call into the armed services. Even the ones with reasonable assurance of deferment felt the insecurity and were unwilling to get tied down to the farm when quicker money and more excitement were available elsewhere.

In addition to an unsure source of good help, Boots had made outside commitments with his growing inventory of farm equipment that required either good help or being two places at one time. With good cows, a man hates to leave their care to someone else. On the other hand, planning and getting the work done with equipment also requires positive guidance and good operation. Boots, who has long preached that "if you own machinery, you must use it," decided to work the machines and make them pay for themselves. On a good size dairy farm, an inventory of good machinery is absolutely necessary if the live competition of other dairy farmers is to be met.

Lastly, Boots owed for some of his machinery, and still needed more to round out a full line that would leave him independent of much outside labor and custom work. The sale of cows did this, cleaned up all current bills, and left Boots sitting with little indebtedness, ready to jump into what looks best this next winter.

### Avoiding Debt

We have constantly been warned that today's farmer should be as near solvent as possible, and that heavy short term debt is extremely dangerous. Now that Boots is out of that hole, he can breathe a sigh of relief. Neither of us feel that he was so far in that he couldn't have swung both machinery and a dairy herd, but we are taking a conservative position, staying with our heads well above water as far as debts go.

In the meantime, Boots has used his machinery for earning current income and reserves, and has steadily gone on filling the barns and silo with good feed and bedding. This winter he will be in a position to jump either way—either back into the dairy business with both feet, or in the quick turnover business of selling some feed and raising young stock and cash crops for one more season.

### PASTURE DROPPINGS

**I**T WASN'T many years ago that a farmer passing a neighbor's place where pasture clipping was under way would have said: "What's that crazy fool trying to take hay off a piece like that for? Why, there's only a few weeds—hardly worth raking up."

Today most good dairymen clip pastures to keep weeds under control, to start aftermath off evenly, and to get rid of over-mature clumps that the cows will avoid anyway.

An equally new practice that would draw as much surprised comment today as clipping did years ago is scattering droppings with a spike tooth harrow,

light float, or any other tool suitable for stirring up the piles. This is a practice long followed in Europe, where every inch of grazing land is important and every pound of fertilizer a necessity.

With the teeth slanted way back, a spike tooth harrow does a good job of scattering clods of field-dropped manure, and the stirring action on the sod itself seems to stimulate a little additional growth. Bunches of grass that remain untouched by cattle because they grow near manure are accepted again as good pasturage. And the manure—which loses a good part of its fertilizer value by leaching and evaporation from a pile—is spread finely over more grass where it goes to work to provide extra plant food that would otherwise be lost.

Whether the practice is worth the time and gas, I do not know. It is worth a try though on irrigated pastures, where we need the best seeding and best grazing on every square inch to pay for the expense of watering.

### TREFOIL POPS UP AGAIN

**A**BOUT the time I forget birdsfoot trefoil, which we once tagged "sure-foot" trefoil at SunnYGables because of its persistence once a seeding caught, the subject pops up again to intrigue me. In July, I looked at the hills we have attempted to seed to trefoil, and found them still gaining, but far from good trefoil stands. We never were able to get a good seeding right off the bat.

I have preferred to stick to something I knew would grow at the drop of a hat—like ladino clover, but will admit that this eventually runs out or is crowded out by competition. Ladino will last a good while under careful management and plenty of fertilizer, but trefoil, once it is in, is there to stay.

### Poultry Pasture

This spring, when birdsfoot trefoil had again been put back as "something to try when you have the time and place," my interest in it was kindled all over again by the good seedings I saw established. One was on a poor horse pasture of heavy clay where no particular precautions in seedbed preparation or fertilization had been taken. The other successful report comes from Francis Townsend, who operates a White Leghorn hatchery and poultry farm at Cazenovia, New York. In a newsletter that he sends out, Mr. Townsend says:

"Half of our poultry pasture is birdsfoot trefoil. The bare spots around the houses on the birdsfoot trefoil are much

smaller than on the ladino-orchard grass. We have mowed the poultry pasture twice, and birdsfoot is a thick carpet of leafy green that seems to be the nicest thing we have ever used for poultry range. There are more leaves on the birdsfoot than on the ladino. We plan to seed more pasture to birdsfoot, using half European and half Empire seed. I think that birdsfoot trefoil is the most important flower that blossoms on our farm."

Maybe plenty of good poultry manure for establishing seedings is part of Mr. Townsend's success. At any rate, when a successful poultryman comes out and calls trefoil the "most important flower that blossoms" on his farm, it makes a fellow stop and think. Maybe there is something to this trefoil after all. Just give me a way to be sure that first seeding catches and I'll go for it myself.

### FEED COWS OR BUGS?

**H**ERE'S an interesting statement from Indiana's great agricultural college at Purdue University, Lafayette, Indiana: "Cattle rations today must be balanced to meet the requirements of both the microorganisms and the cattle."

The microorganisms referred to are those millions of tiny living bodies in a cow's rumen. They are internal manufacturing plants constantly processing the cow's raw materials or feed to produce those nutrients in their final form that the cow's body can use.

As proof to back up their statement that microorganisms in the cow must be fed, Purdue points out that they have successfully added better than a pound a day to steers with corn cobs as the only roughage. Though cobs have a very low feed value by chemical analysis, those microorganisms in the cow go to work and make food from the raw materials. It was further found that substituting a couple of pounds of alfalfa meal for cobs increased weight gains another quarter of a pound—a much higher gain than is indicated by the nutrients added in the alfalfa meal.

The sensible conclusion is that the alfalfa meal, mixed with the cobs, afforded the right diet for the little microorganisms to do their work of producing added feed for the cow.

The net result is that cows fed on cobs that are balanced with extra protein, minerals and vitamins seem to get something for nothing. They gain more than chemical analysis of the feed would indicate. I can't name the seven wonders of the world, but I'll put the rumen of the cow up for number eight.

Boots finished a lot of combining this season, changing off with his brother on days that sometimes stretched way into the night when harvesting weather was good. In spite of a wet season, the yield was not too good. Possible reasons are: competition from grass and weeds due to the wet season, lodging and swamping, again because of a lot of moisture, and maybe failure to use enough fertilizer. Boots combined this field for Jack Conner, where lodging took at least half the potential yield.

With  
**AMERICAN AGRICULTURIST**  
Advertisers

The **PENNSALT MANUFACTURING COMPANY** has for distribution a number of films originally designed to be shown by milk plant field men to dairy farmers. They have full color movies in 16mm. with sound, and 35mm. sound-slide films in black and white. For information on these films write: Pennsalt Chemicals, B-K Department, 1000 Widener Building, Philadelphia 7, Penna.

THE MINNESOTA MINING AND MANUFACTURING COMPANY of St. Paul, Minnesota, is introducing a new electrical tape, which it says offers a very practical solution to the ever-present wiring problems on a modern farm. The tape is useful for many jobs other than electric ones. A postcard to the company will bring you a list of suggested uses for it on the modern farm.

The **INTERNATIONAL HARVESTER COMPANY** has recently announced the new **McCormick Cream Separator**, that flushes, power-washes, sterilizes and dries—all in three minutes. It is called the **McCormick Power-Washing Cream Separator**.

If your silo capacity is inadequate, now is a good time to send to silo companies advertising in **AMERICAN AGRICULTURIST** asking them for catalogs and literature so that you can compare and pick the one best suited for your needs.

The easiest way to get the name of your nearest **Quonset dealer** is to send a postal card to **GREAT LAKES STEEL CORPORATION, STRAN-STEEL DIVISION**, Ecorse, Detroit 29, Mich.

Many subscribers are asking for information about chemicals to kill brush. One such material is **Wee-done brush killer 32**, manufactured by the **AMERICAN CHEMICAL PAINT COMPANY** of Ambler, Pa. and sold through **GLF stores**.

The **SPEED QUEEN CORPORATION**, Ripon, Wisconsin, will be glad to send you literature on **Speed Queen washers and driers**. They suggest you go to your local **Speed Queen dealer** and ask for a free demonstration.

### BROKE CONTRACT

I contracted with a fellow to build a barn for me. In the middle of the job, he demanded \$2,000 above the contract price; and when I refused to pay this, he pulled off the job.

The purpose of a contract in construction work of this sort is to guard the owner against a situation such as this. The contractor sets a certain price for a job, and it is up to him to see that he does the job for the amount agreed on or else take a loss. If he saved a little money legitimately somewhere along the line and his profit was a bit higher than originally figured, you can bet your boots he wouldn't offer to refund any money.

We have known of cases where a contractor ran into real difficulty and, through mutual agreement, the original price was raised somewhat. However, a contractor cannot arbitrarily demand an increase in the contract price. That is why it is wise to be sure that a contract contains provisions for payment that will leave enough due the contractor at all times so he will not find it profitable to leave the job before it is done.

AT LEADING LUMBER DEALERS, HARDWARE and DEPARTMENT STORES

Manufactured by **CENTRAL STATES PAPER & BAG CO.** • St. Louis 15, Mo.

The **TRESCOTT COMPANY** of Fairport, New York, has announced a 6-hole potato bagger for filling 15-pound paper bags. It can be operated by a boy or girl and handles up to 450 bags an hour. The **Trescott Company** has announced the purchase of the **Smith Incubator Company** of Cleveland, Ohio.

**That's Clifford Bower on that tractor** giving me the high sign. I'm going to fill his tanks, drop off some Atlantic Motor Oil and Lubricants he asked for--and he can keep right on working.

And it's that new Atlantic truck I'm driving that makes this possible. Here, let me show you why.

## YOU KNOW WHAT YOU'RE GETTING FROM YOUR ATLANTIC FARM SERVICEMAN

**See these meter ticket printers?** They measure exactly how much gasoline, tractor fuels, kerosene or fuel oils I deliver and stamp the amount on the delivery ticket. Another thing, there's a tank and hose for gasoline and another for oil. So I can deliver both with absolute safety.

**Here I am setting off** some Atlantic Motor Oil and Lubricants. I've got everything that Cliff wanted--in the quantity he wanted. And I'm going to be able to do the same thing for the next stop... and the next...and so on. Because these new trucks hold plenty!

**And when Cliff and his wife** check over my delivery, they have a stamped ticket and an itemized bill. Yes sir, they've got a complete record of what they're getting. Isn't that the kind of service you want? You can get it from any of these new Atlantic trucks. But it would be a good idea to call right away. Here are the numbers to call--pick the one that's nearest.

# ATLANTIC

**P. S.** There may be an opening for a qualified man to run one of these new Atlantic one-stop farm services. If you know of someone, tell him to write The Atlantic Refining Company, Syracuse Savings Bank, Syracuse 2, New York.

# AMERICAN AGRICULTURIST

FOUNDED 1842

THE FARM PAPER OF THE NORTHEAST

**A** BIT MORE than fifty years ago the Methodist Church of Jonesville, Saratoga County, N. Y., like practically every other village church in the world, needed money and its members looked around for a way to get some. They reasoned that a good church was good for a good community, and they followed up this thinking with a money-raising plan that would take in everyone in the village. This plan built itself around a clambake to be cooked in a hot pit and served Labor Day on picnic tables on the church lawn in the shade of the old elms.

The idea took hold of the people of Jonesville, and it worked. And ever since then a clambake has been held on the same church lawn each Labor Day—except for the war years 1942, 1943, and 1944. It has become such an established institution that its fame extends not only into nearby localities but also into several different states from which it attracts guests annually.

Into this venture are drawn practically all the people of Jonesville, regardless of creed, and the democratic way in which they work together is truly remarkable. Everyone contributes his or her share of help. Protestants, Catholics, Jews, fraternal orders, school children, and the home bureau and other organizations pool their time and energies to help support and maintain this lovely old church, a church which they believe helps to nurture the spiritual life and mold the character of the folk of the village.

Much good organization and work go into this event long before the "Go ahead!" signal is given on Labor Day at exactly five minutes to two. In July, a general committee is set up, and from it is drawn a general chairman. Then there are many other committees, one for each division of work. The Purchasing Committee's obligation is to buy food not donated. Another committee works on the donated food angle and solicits foods which people have at that time of the year in abundance, including tomatoes, cucumbers, butter and pickles, as well as old-fashioned steamed brown bread.

The Bake Committee sees that there is native wood to burn, and starts the fire at the right moment in order to give sufficient time to heat the rocks to cooking temperatures. The Table Committee sets up and breaks down the tables on which the bake is served. The Finance Committee prepares the tickets and takes in the money.

These committees head a list of others for preparing, serving and cleaning up after the meal, until practically every able-bodied man, woman, and child in the village is found working some place. The committees decide ahead of time

"A good church is good for a good community," they said, and so the village folk, regardless of creed, join hands each year in a mighty clambake to support it.

just how many guests they will accommodate each year, and tickets are sold for that number. When the supply of tickets is exhausted, no more are available. Last year, 686 tickets were sold by the Wednesday preceding the bake on Monday.

Although those in charge are prepared to move into the Church, firehouse, and under a big tent if it rains, no one ever really seems to count on rain. Some say they have never had a rainy day for the bake. Although the general chairman would not go so far as to say that, he was unable to remember a bake that had ever been rained out.

The food is assembled on the Saturday before Labor Day, and necessary preliminaries to the food preparation are done that day. At this time the women wrap the chickens which have been cut in fair sized pieces easy to handle. Each piece is wrapped separately in squares of cheese cloth, then packed and refrigerated until Monday. Workers take a good rest Sunday, for the work is so expertly charted that nothing needs to be done on the Sabbath.

Monday morning at 4 A.M. sharp, the Bake Committee starts the fires which are kept burning until noon. By that time the embers have done their work and are removed from the rocks. The clam bake is then put in to cook in the following fashion:

A layer of green corn goes in first, and is covered with sweet and white potatoes. Then link sausages are laid on top. The wrapped chicken makes the next layer, and all is topped by the food which makes the feeding affair famous — clams in wire baskets! To decorate and round out the huge pile of food, sixty lobsters are placed on top, to be sold as specialties. A clean white canvas is put over all the food, and a second and heavier canvas covers the first. Then a third is added, over which sand is piled, covering everything completely and insulating the cooker.

This food combination is allowed to cook and mingle its various flavors for two hours. During these hours, the crowd which has gathered stand around as observers, amazed that dinners for more than 600 people are cooking in that mound. They speculate on how much money is represented by the food smells coming through.

"\$700.00 is covered up there," comes from a bystander who knows.

"Well, it doesn't smell like greenbacks stewing!" retorts another in the crowd, and there's a general laugh.

In the meantime, other committees have seen to it that all preparations are made to receive and serve the bake when opened. Places are set around the long tables for the number corresponding to the number of tickets (Continued on Page 17)

## CLAMBAKE Jonesville Style

By ESTELLE E. JONES

When the "GO AHEAD!" signal is given on Labor Day, the Bake Committee uncovers the steaming bako and gets its contents on the tables in five minutes flat. In the rear in picture are some of the hungry throng of paying guests waiting to be fed.

# Three Days in Washington

By HUGH L. COSLINE

**I** HAVE just returned from three days at our nation's capitol, where I attended a meeting of the American Agricultural Editors Association. I am very glad to be home! Washington impresses (and oppresses) me with an atmosphere of unreality, mixed with perpetual "crises," and seasoned with political maneuvers and fears of possible disasters to come.

We listened respectfully, if somewhat skeptically, to Secretary of Agriculture Charles Brannan and PMA Administrator Gus Geisler. Farm Credit Administrator I. V. Duggan had a better report. Farm Credit has an excellent, business-like record of a real farm credit need well met without waste of taxpayers' money. Claude Wickard, Rural Electrification Administrator, made the report which, in my estimation, took second place.

Secretary Brannan, in a brief talk to the editors, expressed regret that leaders of agriculture were not speaking to Congress in one united voice. Naturally, he does not like some of the comments which Allan Kline, president of the American Farm Bureau Federation, and others have made. Mr. Kline has been outspoken in his criticism of price supports, price controls, socialism in government and continued deficit spending by government.

## Who Created Antagonism?

I took the opportunity to point out to some of my Washington friends that the government and the Department of Agriculture are responsible for a considerable part of the antagonism which consumers have toward farmers. Consumers have been told that food prices are high. They are irritated with government price supports and with PMA payments and they feel that farmers are pets of the government.

I was asked how the Family Farm Policy Meetings were going in the country. I replied that in my opinion they would backfire and harm rather than help the USDA.

In the first place, farmers are beginning to realize that the mere holding of such meetings is an implied insult to the Farm Bureau Federation, the Grange, and other farm organizations. The inference is that the USDA couldn't get grass roots information from them but had to get it through meetings sponsored by USDA and held in the summer when farmers are busy.

Then I quoted a couple of comments I had heard. One farmer said that he

never realized before just how many government employees were connected with agricultural enterprises in his county. Another pointed out that at one meeting there were more paid government employees present than there were farmers!

## Research Pays

We spent a day at the Beltsville Experiment Station. Here is where one of the real purposes of the Department of Agriculture—research—is being carried out. Yet so far as getting information to the general public is concerned, the results are overshadowed by a multitude of government activities such as price supports, PMA payments, loans, soil conservation — not to mention a half dozen others.

It is unfortunate also that following an era where government activities affecting agriculture have mushroomed into an unwieldy structure, research takes the same percentage cut as less essential activities when Congress gets "economy-minded."

What may be worse is that the hands of farm leaders and farm paper editors are tied. Regardless of how important they believe research to be, they cannot get in the position of fighting economy in any government branch; otherwise they are open to the accusation of promoting selfish interest—of wanting economy for "the other fellow." Nevertheless, it is encouraging to find that Congress is "economy-minded," and I heard many expressions of approval among the editors. Many of them believe not only that there are enormous possibilities for economy in domestic affairs, but also that while defense spending is necessary and favored by most people, Congress should keep a close eye on defense expenditures to see that we get our money's worth for every dollar spent.

Just a few comments about some of the experimental work we saw which, of course, is so extensive that it cannot possibly be seen in one day. At Beltsville they are starting some fundamental research in the keeping of grass silage. They are engaged in crossing Jerseys and Red Sindh cattle from India in an attempt to get a dairy breed that will stand hot weather in southern states. In beef cattle they are using identical twins to find out how roughing an animal on inadequate rations affects later gains when put on full feed.

We heard a summary of some research into the factors that make high egg quality and a report on the development of rapidly maturing meat birds. It was all vitally important and intensely interesting.

But research has many angles. We spent the next day with the U. S. Industrial Chemicals Company at Baltimore. They have been working on control of injurious insects. One of the interesting, if not the most valuable stops, was in part of the building where they breed cockroaches, flies and weevils to be used in experiments. I saw more cockroaches than I had seen in my entire lifetime! One of the new things we saw there was a material which can be mixed with wheat and other grain to prevent weevil damage without harming either animals or humans.

As you will see, the depressing part of the meeting came first, to be followed by a glimpse into ever-stimulating research. In addition, there is always the pleasure of meeting old friends and discussing mutual problems with editors of publications which go into practically every farm home in the country.

"I'm gonna ship 'em back. These hip boots are a little short for me."

# "You can spray it Any Time of year"

## WEEDONE<sup>®</sup> BRUSH KILLER 32

**That's right! It kills dormant brush just as effectively as growing plants!**

**And here are 6 outstanding advantages of dormant spraying:**

- 1. NO POSSIBILITY OF DRIFT TO SUSCEPTIBLE CROPS**—Winter spraying reduces drift hazard to the minimum because sensitive plants are not growing at that season.
- 2. CERTAIN RESISTANT SPECIES ARE MORE SENSITIVE TO BASAL SPRAY**—Red maple, and certain other species hard to kill with leaf sprays, are killed by basal spray.
- 3. AN AID TO ESTABLISHING GRASSES ON ROAD BANKS**—Spraying road banks in summer leaves ground bare — creates the danger of erosion. Winter spraying prepares ground for early spring seeding with legumes or grasses—prevents erosion.
- 4. MINIMIZES DANGER TO CATTLE FROM POISONOUS PLANTS**—Weedone Brush Killer 32 is not poisonous to animals. But it might make certain poisonous species more palatable to them. (Especially true of wild cherry.) The best time to spray these plants, therefore, is winter, when they are not in leaf and not likely to attract animals.
